The congress of Vienna in 1815 took down from the theatre of Italy all Bonaparte's decorations, and set up the old scenery in very nearly the old places. Vittorio Emmanuele I. received back his kingdom of Sardinia, with the addition of Genoa. Venice and Milan were formed into the province of Lombardo-Venezia for Francis II., emperor of Austria. The old duchy of Parma was given for her lifetime to Maria Louisa, who, though the wife of Bonaparte, was still an Austrian princess. Upon her death it was to be restored to its former Bourbon princes, who received in the meanwhile Lucca as an equivalent.

The Austrian Ferdinand III. was once again grand-duke of Tuscany, with the reversion of Lucca after Maria Louisa's decease. Francis, son of the Austrian archduke Ferdinand and Beatrice d'Este, became duke of Modena, with the reversion of Lunigiana on the same event. Pius VII. got back all the states of the church, and on his re-entry into Rome restored the Jesuits, who had proved their indispensability to tyrants. The Bourbon Ferdinand I. again joined Naples to his crown of Sicily. We have been careful to label these Ferdinands and Francises with their respective names of Austrian or Bourbon, in order that the partition of Italy between the two dynasties, and the large preponderance of Austrian over Bourbon influence, might be apparent. One significant detail has been omitted. The congress of Vienna recognized the independent republic of San Marino. On the top of a little mountain at the outskirts of the Apennines which overlook the sea by Rimini, sat Liberty, the queen of a few hundred citizens, surveying the muddy ocean of Franco-Spanish, Italo-Teutonic despotism which drowned Italy through all her length and breadth.

The Italian sovereigns, on returning to their respective states, proved that exile and the revolution had terrorized them into more determined tyranny. The civil and political reforms which had been instituted at the end of the last century were abandoned. The Jesuits were restored; many suppressed monasteries were re-established; and the mortmain laws were repealed. Elementary education was narrowed in its limits, and thrown into the hands of the clergy. Professors suspected of liberal views were expelled from the universities, and the press was placed under the most rigid supervision. All persons who had taken part in the Napoleonic governments, or who were known to entertain patriotic opinions, found themselves harassed, watched, spied upon, and reported. The cities swarmed with police agents and informers. The passport system was made more stringent, and men were frequently refused even a few days' leave of absence from their homes. The Code Napoléon was withdrawn from those provinces which had formed part of the Italian kingdom, while, in the papal states, the administration was placed again in the hands of ecclesiastics.

Austrian preponderance.

This political and spiritual reign of terror, which had for its object the crushing of Italian liberalism, was sanctioned and supported by Austria. Each petty potentate bound himself to receive orders from Vienna, and in return for this obedience the emperor guaranteed him in the possession of his throne. The Lombardo-Venetian kingdom, powerfully defended and connected with Austria by land and sea, became one huge fortress, garrisoned with armed men, in perpetual menace of the country. Under these conditions the Italians were half maddened, and thousands of otherwise quiet citizens, either in the hope of finding redress and protection, or only from a feeling of revenge, joined secret revolutionary societies; for it must not be supposed that the revolution had left the Italians as passive as it found them. A new spirit was astir, which was not likely to be checked by the arrangements of the European congress—the spirit of national independence. During the convulsions caused by Napoleon's conquest of Italy, the allied powers had themselves fostered this spirit, in order to oppose French rule. The Austrians, the English, and Murat, in turn, had publicly invited the Italians to fight for their national independence. And now the people, who relied upon these proclamations and expected the fulfilment of so many promises, found themselves by the consent of Europe delivered over, tied and gagged, to a foreign oppressor. To take but one example: Ferdinand, when he quitted Naples in May, 1815, addressed a proclamation to his subjects, solemnly engaging to respect the laws that should in his absence be decreed by a constitution. In June he pledged himself at Vienna to introduce into his kingdom no institutions irreconcilable with those which Austria might establish in her own dependencies. Accordingly in 1816 he put an end to the Sicilian constitution of 1812.

Revolutionary struggles.

Tyranny was met by conspiracy; and in a short while the Carbonari societies, with Sanfedisti and many other revolutionary associations, had extended their organization through the length and breadth of the peninsula. The discontent of the Italians smouldered for five years; but in 1820 it broke into open flame. On the 1st of January in that year the Spaniards proclaimed their constitution of the Cortes, which was modelled on the type furnished by the earlier French Revolution. Moved by this example, the royal army mutinied at Naples in July, and a few days afterwards Palermo rushed to arms. Ferdinand was so surprised by the sudden outbreak of this revolt that he hastily granted the constitution, named his son Francis vicar-general of his kingdom, and betook himself to Austria. The Austrians marched 80,000 men into Lombardy, and Great Britain and France sent their fleets down to the Bay of Naples. At a congress held in the spring of 1821 at Laybach, the allied powers authorized Austria to crush the revolution in Lower Italy. Austrian troops entered Naples on the 23d of March; and when Ferdinand followed them, he had nothing to do but to execute vengeance, by mock trials, on his insurgent subjects.

While these events were taking place, another military insurrection broke out in Piedmont, where the Spanish constitution was proclaimed. The king felt himself bound by the congress of Laybach, and refused to make any concessions. Therefore, on the 13th of March, he abdicated; and in the absence of his brother and heir, Carlo Felice, his distant cousin, Carlo Alberto, prince of Carignano, was appointed regent. Carlo Alberto represented a branch of the reigning house which had been separated nearly two centuries from the throne. Educated, during the French occupation, more like a private citizen than like a prince, he grew up with liberal inclinations, and there is no doubt that his concessions to the insurrectionists in Piedmont at this moment were actuated by sympathy rather than by any vulgar desire to gain power. When, however, Carlo Felice returned and declared that his brother's abdication had been forced and was therefore illegal, Carlo Alberto's sense of loyalty to the dynasty overcame his liberal instincts. He submitted to the new king's authority, and the old regime was re-established in Piedmont on as absolute a basis as before.

These movements were followed by state trials and executions, and the terrorism of the tyrannies augmented. Silvio Pellico, at the close of an inefficient disturbance at Milan, was sent to life-imprisonment at Spielberg. In the papal states Leo XII. adopted a coercive policy still more grinding and humiliating. For nine years the despots and the conspirators confronted each other, until the July revolution of Paris in 1830 gave new hope and energy to the latter. On this occasion the conflagration burst out at Modena, where the duke Francesco IV. had been for some time past in secret negotiation with the patriotic party headed by Ciro Menotti. It appears that the secret object of this autocrat was to employ the revolution against his neighbors, and to make himself sovereign of Upper Italy by the help of the conspirators. But when the revolution declared itself, and spread to Parma, Bologna, and the Romagna, Francesco turned upon his friend Menotti, and succeeded in putting him to death. It took but little time or trouble to check this revolt, which was unsupported by armed force. Austrian troops moved into Emilia and Romagna, restored the old order, and marched on to Rome, which they occupied. Louis Philippe, now king of the French, being jealous of the Austrians at Rome, occupied Ancona for the French in 1832; but the cause of Italian liberty received no support from the bourgeois king, who strove to keep on good terms with established authorities.

Revolution in abeyance.

From 1831 until 1846 Italy remained discontentedly and uneasily tranquil. The infamous misgovernment of Rome and Naples continued; and in Lower Italy numerous petty insurrections, caused by the misery of the people, and the cholera which raged in 1837, were easily suppressed. Yet it was clear to all competent observers that this state of things could not last. The Italian sovereigns were seated over a volcano, which vibrated to the least stir in its neighbor, France, and which was slowly accumulating explosive material. Among the most powerful instruments now invented by the party of independence must be reckoned the scientific congress. This body, ostensibly formed for the study of science, assembled every year in some Italian city. Its meetings really served to propagate liberal opinions and to establish relations between the patriots of different districts. Meanwhile the great men who were destined to achieve the future union of Italy had appeared upon the stage, and were busy through this period with their pen and voice. Giuseppe Mazzini, born in 1808 at Genoa, made himself the recognized head of a party called by the name of Young Italy. It was his aim to organize the forces of the revolution, and to establish the one and indivisible republic in Europe. Though he strove in the cause of Italy, his scheme for the regeneration of society far exceeded the limits of that country. He declared war upon established order in its ancient forms all over the world, and was willing to use conspiracy, if not assassination, in order to achieve his ends. Thus, though the spirit infused into the Italians by Mazzini's splendid eloquence aroused the people to a sense of their high destinies and duties, though he was the first to believe firmly that Italy could and would be one free nation, yet the means he sanctioned for securing this result, and the policy which was inseparable from his opinions, proved obstacles to statesmen of more practical and sober views. It was the misfortune of Italy at this epoch that she had not only to fight for independence, but also to decide upon the form of government which the nation should elect when it was constituted. All right-thinking and patriotic men agreed in their desire to free the country from foreign rule, and to establish national self-government. But should they aim at a republic or a constitutional monarchy? Should they be satisfied with the hegemony of Piedmont? Should they attempt a confederation, and if so, how should the papacy take rank, and should the petty sovereigns be regarded as sufficiently Italian to hold their thrones? These and many other hypothetical problems distracted the Italian patriots. It was impossible for them, in the circumstances, first to form the nation and then to decide upon its government; for the methods to be employed in fighting for independence already implied some political principle. Mazzini's manipulation of conspiracy, for instance, was revolutionary and republican; while those who adhered to constitutional order, and relied upon the arms of Piedmont, had virtually voted for Sardinian hegemony. The unanimous desire for independence existed in a vague and nebulous condition. It needed to be condensed into workable hypotheses; but this process could not be carried on without the growth of sects perilous to common action.

The party of Young Italy, championed by Mazzini, was the first to detach itself, and to control the blindly working forces of the Carbonari movement by a settled plan of action. It was the programme of Young Italy to establish a republic by the aid of volunteers recruited from all parts of the peninsula. When Carlo Alberto came to the throne, Mazzini addressed him a letter, as equal unto equal, calling upon the king to defy Austria and rely upon God and the people. Because Carlo Alberto (who, in spite of his fervent patriotism and genuine liberality of soul, was a man of mixed opinions, scrupulous in his sense of constitutional obligation, melancholy by temperament, and superstitiously religious) found himself unwilling or unable to take this step, the Mazzinisti denounced him as a traitor to 1821 and a retrogressive autocrat. In his exile at Geneva, Mazzini now organized an armed attempt on Savoy. He collected a few hundred refugees of all nations, and crossed the frontier in 1833. But this feeble attack produced no result beyond convincing Carlo Alberto that he could not trust the republicans. Subsequent attempts on the king's life roused a new sense of loyalty in Piedmont, and defined a counter-body of opinion to Mazzini's. The patriots of a more practical type, who may be called moderate liberals, began, in one form or another, to aim at achieving the independence of Italy constitutionally by the help of the Sardinian kingdom. What rank Sardinia would take in the new Italy remained an open question. The publication of Vincenzo Gioberti's treatise, *Il Primato morale e civile degli Italiani*, in 1843, considerably aided the growth of definite opinion. His utopia was a confederation of Italian powers, under the spiritual presidency of the papacy, and with the army of Piedmont for sword and shield. This book had an immense success. It made timid thinkers feel that they could join the liberals without sacrificing their religious or constitutional opinions. At the same date Cesare Balbo's *Speranze d' Italia* exercised a somewhat similar influence, through its sound and unsubversive principles. In its pages Balbo made one shrewd guess, that the Eastern Question would decide Italian independence. Massimo d'Azeglio, who also was a Piedmontese; the poet Giusti, the Baron Ricasoli, and the Marchese Gino Capponi in Tuscany; together with Alessandro Manzoni at Milan, and many other writers scattered through the provinces of Italy, gave their weight to the formation of this moderate liberal party. These men united in condemning the extreme democracy of the Mazzinisti, and did not believe that Italy could be regenerated by merely manipulating the insurrectionary force of the revolution. On political and religious questions they were much divided in detail, suffering in this respect from the weakness inherent in liberalism. Yet we are already justified in regarding this party as a sufficient counterpoise to the republicans; and the man who was destined to give it coherence, and to win the great prize of Italian independence by consolidating and working out its principles in practice, was already there. The count Camillo Benso di Cavour had been born in 1810, two years later than Mazzini. He had not yet entered upon his ministerial career, but was writing articles for the *Risorgimento*, which at Turin opposed the Mazzinistic journal *Concordia*, and was devoting himself to political and economical studies. It is impossible to speak of Mazzini and Cavour without remembering the third great regenerator of Italy, Giuseppe Garibaldi. At this date he was in exile; but a few years later he returned, and began his career of popular deliverance in Lombardy. Mazzini, the prophet, Garibaldi, the knight-errant, and Cavour, the statesman, of Italian independence, were all natives of the kingdom of Sardinia. But their several positions in it were so different as to account in no small measure for the very divergent parts they played in the coming drama. Mazzini was a native of Genoa, which ill tolerated the enforced rule of Turin. Garibaldi came from Nice, and was a child of the people. Cavour was born in the midst of that stiff aristocratical society of old Piedmont which has been described so vividly by D'Azeglio in his *Ricordi*. The Piedmontese nobles had the virtues and the defects of English country squires in the last century. Loyal, truthful, brave, hard-headed, tough in resistance, obstinately prejudiced, they made excellent soldiers, and were devoted servants of the crown. Moreover, they hid beneath their stolid exterior greater political capacity than the more genial and brilliant inhabitants of Southern and Central Italy.

Cavour came of this race, and understood it. But he was a man of exceptional quality. He had the genius of statesmanship,—a practical sense of what could be done, combined with rare dexterity in doing it, fine diplomatic and parliamentary tact, and noble courage in the hour of need. Without the enthusiasm, amounting to the passion of a new religion, which Mazzini inspired, without Garibaldi's brilliant achievements, and the idolatry excited by this pure-hearted hero in the breasts of all who fought with him and felt his sacred fire, there is little doubt that Cavour would not have found the creation of United Italy possible. But if Cavour had not been there to win the confidence, support, and sympathy of Europe, if he had not been recognized by the body of the nation as a man whose work was solid and whose sense was just in all emergencies, Mazzini's efforts would have run to waste in questionable insurrections, and Garibaldi's feats of arms must have added but one chapter more to the history of unproductive patriotism. While, therefore, we recognize the part played by each of these great men in the liberation of their country, and while we willingly ignore their differences and disputes, it is Cavour whom we must honor with the title of the Maker of United Italy.

Constitutional reforms.

From this digression, which was necessary in order to make the next acts in the drama clear, we now return to the year 1846. Misrule had reached its climax in Rome, and the people were well-nigh maddened, when Gregory XVI. died, and Pius IX. was elected in his stead. It seemed as though an age of gold had dawned; for the greatest of all miracles had happened. The new pope declared himself a liberal, proclaimed a general amnesty to political offenders, and in due course granted a national guard, and began to form a constitution. The Neo-Guelfic school of Gioberti believed that their master's utopia was about to be realized. Italy went wild with joy and demonstrations. The pope's example proved contagious. Constitutions were granted in Tuscany, Piedmont, and Rome in 1847. The duke of Lucca fled, and his domain was joined to Tuscany. Only Austria and Naples declared that their states needed no reforms. On the 2d of January, 1848, a liberal demonstration at Milan served the Austrians for pretext to massacre defenceless persons in the streets. These Milanese victims were hailed as martyrs all over Italy, and funeral ceremonies, partaking of the same patriotic character as the rejoicings of the previous year, kept up the popular agitation. On the 12th of January Palermo rose against King Ferdinand II., and Naples followed her example on the 27th. The king was forced in February to grant the constitution of 1812, to which his subjects were so ardently attached.

Revolution of 1848.

While Italy was thus engaged in making terms with her own sovereigns, the French revolution broke out. Louis Philippe fled to England, and the republic was declared. This altered affairs in Italy, and threw a temporary power into the hands of the Mazzinisti. Sicily pronounced herself independent of the Bourbons, and called the duke of Genoa to the throne. In Naples, the moderate liberal government, of which Poerio had been a member, yielded to a more radical administration. The patriots and the king's troops came to blows, ending in Ferdinand's victory and the remodelling of the constitution. Lombardy rose in insurrection. The Austrians were expelled from Milan, and the governor of Venice capitulated. Provisional republican governments were formed, at Milan under the presidency of Casati, at Venice under that of Daniele Manin. Impelled by the overwhelming enthusiasm which prevailed in Upper Italy, Carlo Alberto declared war on Austria in March. On the 8th of April he pushed his troops beyond the Mincio; while Piacenza, Parma, Modena, and the Lombardo-Venetian kingdom voted their union to Sardinia by universal suffrage. But the Austrian general, Radetzky, though he lost a battle at Goito, and was forced to witness the capitulation of Peschiera in May, had not given up the game. The pope's troops were established at Vicenza to support the Sardinians. These Radetzky compelled to surrender in June; he then attacked Carlo Alberto's army, who were engaged in the investment of Mantua. A complete victory upon the 25th of July at Custozza enabled Radetzky to re-enter Milan. Carlo Alberto had to retire beyond the Ticino and to beg for an armistice. News of this Austrian victory reached Naples, and gave Ferdinand the heart to quell the Sicilian revolt. On the 30th August Messina was bombarded, and such atrocities were perpetrated in the miserable city that the admirals of the French and English fleets had to interfere and extort an armistice from the conquerors. In the meanwhile, affairs had begun to change in Rome. The pope, frightened at the revolution which had already outrun his control, pronounced against the Austrian war and Italian alliance. This roused republican hostility. His minister, the excellent Count Pellegrini Rossi, was murdered in November, and anarchy seemed to threaten the city. Pius escaped in disguise to Gaeta, where he was received by Ferdinand, whom not long since he had denounced as a rogue. From Gaeta he opened the new year, 1849, with a threat of excommunication to his subjects. The Romans were so irritated that the moderate liberal party had to yield to the ultra-radicals; and on the 9th of February Rome was declared a republic. The government was entrusted to three dictators, of whom Mazzini was the head. Tuscany, meanwhile, had lost her grand-duke. After opening parliament in January with a declaration that he intended to prosecute the war against Austria, he escaped in February on the English war-steamer "Bulldog" to Gaeta. A provisional government was established in Florence, and Mazzini did his best to render Tuscany a part of the new Roman republic. At this epoch two important personages appeared upon the scene—Gino Capponi, who led the moderate liberals, and Urbano Rattazzi, who headed the democratic party. The Florentines were not at bottom out of sympathy with their duke. Therefore they rejected Mazzini's overtures, and recalled Leopold upon the understanding that he would respect their free institutions. Still at Gaeta, the grand-duke mistrusted these advances, begged for Austrian troops, and, when they had arrived, re-entered Tuscany and suppressed the constitution. Such acts of perfidy as these, repeatedly committed by all the petty sovereigns of Italy, with the exception of the house of Savoy, forced the people to abandon the theory of federation under existing governments, and to look for their salvation to Piedmont.

Sardinia called to the Italian hegemony.

This growing confidence in the Sardinian monarchy was not shaken by the disastrous campaign of March, 1849, which baptized the cause of Italian independence with the best blood of Piedmont, gave it a royal martyr, and pledged the dynasty of Savoy to a progressive policy from which it never afterwards for a single moment deviated. Pushed by the ultra-radicals, and burning with the purest zeal to liberate Italy, Carlo Alberto took the field again in March, 1849, against the Austrians. On the 24th, after some preliminary movements, proving a want of good generalship and discipline in the Piedmontese army, Radetzky obtained a complete victory at Novara. The king of Sardinia abdicated on the field, in favor of his son, the duke of Savoy, Vittorio Emmanuele II. Carlo Alberto, who had lived through times so troublous and perplexing, who had exposed himself to misunderstanding and misinterpretation, but in whom the devotion to Italy had become a religion, now took refuge at Oporto, where he died, broken-hearted, after a few months of illness. The pathos of this death checked the snarling of discordant parties; and, when the king's body was brought home to be buried on the heights of the Superga, the heart of Italy recognized his worth. Carlo Alberto, though still anathematized by the republican faction, became the saint of Italy. Hundreds of pilgrims flocked to his tomb. The loyalty of his subjects redoubled; and it was felt that by serving Italy they would glorify his memory. More than ever, by the disasters of Novara, were the dynasty and aristocracy and people of Sardinia pledged to that national policy which Carlo Alberto's son triumphantly accomplished. In the cottage homes of Piedmont and Lombardy travellers may still behold the old king's agony depicted side by side with the portraits of Cavour and Garibaldi and Vittorio Emmanuele.

The intrigues of which Gaeta had been a centre provoked a crusade of the Catholic powers against republican and anti-papal Rome. A French expedition, under General Oudinot, landed at Civita Vecchia on the 25th of April, and on the 29th reached the walls of the city. The Neapolitan army took up a position at the base of the Alban hills. Spaniards arrived at Fiumicino, and Austrians entered the Legations. The French professed to come as friends; but the triumvirs of the Roman republic refused them entrance, and General Oudinot established his camp on the Janiculan. Garibaldi, who was guarding the frontier of the Abruzzi, returned and defeated the Neapolitans at Palestrina on the 11th of May. Still his assistance did not suffice to avert the French attack, and on July 2, after a siege of four weeks, the city capitulated. Mazzini and Garibaldi made good their escape. The French troops entered and held Rome for the pope. It was not until April, 1850, however, that Pius IX. ventured to return. When he arrived in his capital, he began the reactionary reign, supported by his French garrison and Jesuit advisers, which only ended with the semi-forcible entry of the Italians in 1870.

Suppression of the revolution.

With the fall of Rome the hopes of the revolutionary party ended. Austrian troops replaced their ducal puppets in Parma, Modena, and Tuscany. King Ferdinand, rightly now named Bomba, terrorized his subjects into silence by the aid of Swiss mercenaries, artillery, and dungeons too loathsome to be described. Only Venice still held out, blockaded in the Adriatic and bombarded from the land, through all the horrors of famine, conflagration, and cholera, until the month of August. Few episodes in the history of that noble city are more glorious than this last desperate and patient struggle; and few names upon her muster-roll of heroes are equally illustrious with that of the lion-hearted and blameless Daniele Manin.

Reorganization of Sardinian kingdom.

In the disastrous year 1849 it seemed as though the fate of Italy was sealed. The republicans had done their best and failed at Milan, Rome, and Venice. The power of Piedmont was broken at Novara. And yet we have good cause to say that the miseries of this epoch wrought the future salvation of the race. The former vain trust in the Italian sentiment of petty courts, the Neo-Guelfic mysticism of Gioberti's party, the utopian confidence in papal liberalism, the vague schemes of confederation which had assumed many visionary forms, were all dissipated for ever. To rightly thinking men it became clear that the regeneration of Italy must be entrusted to Piedmont. When Vittorio Emmanuele entered Turin in silence after Novara, with a demoralized army and a ruined exchequer, the spirit of his people was cast down, but not extinguished. They had assumed responsibility, and were not going to abandon it. "The house of Savoy cannot retreat" became the watchword of the throne. D'Azeglio's *Nous recommencerons* expressed the determination of the ruling classes. It is true that at this crisis they had to combat the hostility and bitter jealousy of the republicans. Mazzini's party stirred up Genoa to revolution, and La Marmora received the ignoble task of restoring that intractable city to a sense of duty. "Better Italy enslaved than delivered over to the son of the traitor Carlo Alberto," exclaimed the prophet of democracy, whom no reverses could persuade that in such politics as those of Italy the half is better than the whole. But Mazzini was no longer a power of the first magnitude. The work which he had done for Italy was solid and abiding. Still he had failed to carry the bulk of the nation with him. Men of more sober aspirations saw that to aim at national independence and European reconstruction at one leap was utopian. Italy must first be made; and the only power capable of calling her into existence was Piedmont, still free and puissant among a crowd of feeble and anarchical despotisms. The experiences of '49 proved that the armies of Piedmont, in the hour of need, could rely on volunteers of pith and nerve, in cities so downtrodden even as were Rome and Venice; for it must not be forgotten that the republicans who sustained both sieges were members of the bourgeoisie and proletariate. This consolidation of opinion after the events of 1849 was proved by Gioberti's recantation of his earlier mysticism. In 1851 he published a new treatise, the *Rinnovamento*, which distinctly indicated Piedmont as the substantial basis of Italian independence. Daniele Manin, now an exile in Paris, declared his adhesion to the same doctrine. The constitutional party was further strengthened by the adhesion of the leading republicans, Pallavicino and La Farina; and in 1857 the main point of unanimity was secured by the formation of the *Società Nazionale*, which kept sectarian jealousies in the background. Garibaldi, at this time less republican than he afterwards became, was himself a president of this political association. Henceforward the genuine Mazzinisti formed a permanent minority. They could do little more than to impede without perplexing or baffling the policy of the Piedmontese statesmen, who felt themselves to be supported by the instincts of the race at large.

Vittorio Emmanuele began his reign with Massimo d'Azeglio for minister. He steadily refused all Austrian advances, though enforced by his own wife and mother, both of whom were Austrian archduchesses. The house of Savoy had pledged itself to Italy, and the house had never broken faith. The first cares of the new ministry were devoted to internal reforms, to the organization of the army by La Marmora, and to financial measures. In 1850 they passed the so-called Siccardi law, which abolished ecclesiastical courts. This was followed by a law of civil marriage; and in 1854 the ecclesiastical reforms were completed by Rattazzi's bill for restricting religious corporations and placing church property under state control. The necessity of these measures is demonstrated by the fact that the little kingdom of Sardinia counted 41 bishops, 1417 canonries, about 18,000 persons vowed to a monastic life, and one ecclesiastic to every 214 inhabitants. Their importance will be understood when we reflect that these laws were extended to Italy after the union.

Cavour's administration.

Meanwhile Cavour had joined the government in 1850, as minister of commerce. Not least among his great qualities was a thorough understanding of parliamentary tactics; and, though his first attempts at public speaking were unsuccessful, he soon remedied this defect. Mastery of facts and moral force gave weight to his eloquence far above rhetoric. Meanwhile his study of English politics, and admiration for men like Pitt and Peel, developed what in him was an innate instinct for parliamentary leadership. This sound sense of the conditions of representative government induced him to form a coalition with Rattazzi, the leader of the democrats, in 1852. D'Azeglio and the king were frightened by so bold a step. But Cavour's preponderance in the chambers was irresistible; and in November, 1853, he superseded D'Azeglio as prime minister. From this date the fortunes of Italy were in his hands, and Cavour became one of the foremost men in Europe. It was by his advice that the Sardinian troops under General La Marmora took part with France and England in the Crimean war, where they distinguished themselves in the battle of the Tchernaya. The nation by this step secured powerful allies, forced itself upon the notice of Europe, and accustomed its army to service on a grand scale. At the congress of Paris in 1856 Cavour represented Sardinia, and laid the grievances of Italy before the allied powers. Both France and England remonstrated, but vainly, with Ferdinand II. for his misgovernment.

Cavour had travelled both in England and France, and had observed that, though the English sympathized with Italy and were horrified by what they heard of Neapolitan atrocities, he was not likely to get more than moral support and non-interference from Great Britain. Yet he could not work Italian independence without the help of one of the great powers against Austria. He therefore determined to rely on Louis Napoleon Bonaparte, who had expressed his willingness to afford substantial assistance at the proper moment. Between the years 1856 and 1859 it was Cavour's one endeavor to maintain the French emperor in this resolve, and at the same time to drive the Austrians into a seasonable declaration of war.

The situation was delicate and dangerous in the extreme; and in January, 1858, the minister's combinations were seriously imperilled by Felice Orsini's attempt on Napoleon's life. It was only by passing a bill which defined the crime of political assassination that he regained the emperor's confidence. Later in the year, Cavour met Napoleon at Plombières, where the preliminaries to a Franco-Italian alliance for war against Austria were settled.

Lombard campaign of 1859.

The cabinet of Vienna, harassed by repeated memorials on the subject of their tyranny in Lombardy, complained to Europe that Piedmont was a standing menace to Italian peace, withdrew its minister from Turin, and demanded the disarmament of the Sardinian kingdom. Louis Napoleon now prepared himself for war. On the 1st of January, 1859, Vittorio Emmanuele opened parliament with a speech which declared the coming struggle: "We are not insensible to the cry of suffering that rises to us from so many parts of Italy." The words *Grido di dolore* were understood to be the watchword of the war. In the early summer of 1859 the French crossed the Alps. The puppets of Parma, Tuscany, and Modena fled, as usual, before the gathering storm, —this time never to return. The battles of Magenta (June 4) and Solferino (June 24) opened Lombardy to the French and Sardinian troops, as far as the Quadrilateral of fortresses protecting Venice. There Louis Napoleon sheathed his sword. He met the emperor Francis Joseph at Villa Franca, and, without consulting his allies, agreed to an armistice. At Plombières he had declared that he meant to free Italy from the Alps to the Adriatic. But now he agreed upon the Mincio as the future boundary between Sardinia and Austria. Venice was not to be liberated. Terrible was the disappointment of the Piedmontese, who had made vast sacrifices for this campaign, and who felt that their king had been insulted. Yet Louis Napoleon was incapable of more. He knew himself to be no general, and he had good reason to be certain that, if he pushed Austria too far, Prussia would take up arms and carry war to France upon the Rhine. Moreover, the gain to Italy proved greater than at first appeared. Tuscany, Modena, Parma, and Romagna declared their determination to join the kingdom. In March, 1860, the annexation of Central Italy to Sardinia was effected, and approved by the French emperor. It now appeared that, according to a hitherto secret understanding with Cavour, Louis Napoleon was to take Savoy and Nice as the price of his assistance. This sacrifice of their ancient home, the cradle of their dynasty, the house of Savoy made to the Italian cause. But it was long before the Italians forgave Cavour. He had to bear reproaches from all quarters, especially from Garibaldi, who was never tired of repeating, "That man has made me a foreigner in my own house."

Garibaldi's liberation of Lower Italy.

The same month which witnessed the annexation of Central Italy saw the outburst of a revolution in the south. Bomba was dead; but his son Francis II., by continued acts of cruelty to state prisoners, and by cowardly oppression of his subjects, had merited the nickname of Bombino. Refugees from Naples spread the tale of Bourbon tyranny all over Europe. Even London trembled with rage at Poerio's sufferings. The insurrection broke out at Palermo, Messina, and Catania. Garibaldi determined to support it. On the 5th of May he set out from Genoa with his volunteers, the famous Mille, each of whom became for Italy a hero. Cavour knew of the expedition and secretly favored it, though he openly expressed the regret of the Sardinian Government to Europe. It was his policy to wait and see what happened, trusting that the gain of the venture would accrue to the new kingdom. Garibaldi landed at Marsala, and proclaimed himself dictator in the name of Vittorio Emmanuele, king of Italy. The conquest of Sicily was the matter of a few days. In August the general crossed to Spartivento, defeated the royal army, drove Francis II. to Gaeta, and entered Naples on the 7th of September. There Mazzini joined him, and the difficulties of the situation began to disclose themselves. Garibaldi had no capacity for administration; yet he was unwilling to resign his dictatorship. He had proclaimed Vittorio Emmanuele; yet he lent an ear to the republicans, who hated Piedmont. Moreover, he hardly concealed his intention of marching on Rome. Had he taken this step, success would have involved reactionary interference on the part of Europe, while failure might have involved the loss of Lower Italy. Meanwhile the natives of the Two Sicilies were slow to accept annexation. They dispensed with the Bourbons gladly; but they were ready to fulfil the prophecy of Bomba, that "whosoever turned the Bourbons out would have enough to do in Lower Italy for the next century." Anarchy began to reign, and the Bourbon party lifted up its head again at Gaeta. In these circumstances, Cavour, after ascertaining that he had the sanction of Napoleon, resolved on sending troops into the papal states. This seemed the only means of preventing Garibaldi's march on Rome, and securing his acquisitions for United Italy. General Cialdini accordingly occupied Urbino and Perugia, defeated the pope's general, Lamoricière, at Castelfidardo, joined Garibaldi, and helped him to gain a victory over the Bourbon troops on the Volturno. On the 2d of October Cavour defined the situation for the parliament at Turin: "Garibaldi wishes to perpetuate the revolution; we wish to terminate it." Soon after this, Vittorio Emmanuele himself entered the Abruzzi. Garibaldi, with the loyalty which never deserted him, resigned his dictatorship, and returned to Caprera. In November Cavour was able to write to Berlin: "We are Italy; we work in her name; but at the same time it is our policy to moderate the national movement and maintain the monarchical principle."

Proclamation of Italian kingdom.

In February, 1861, Gaeta fell, after a resistance ennobled by the courage of Francesco's German consort. The kingdom was annexed by plebiscite, and Vittorio Emmanuele was proclaimed king of Italy at Turin. Europe tacitly assented to Italian independence. Only Rome and Venice now remained to be liberated. The difficulties under which new Italy labored were enormously increased by the annexation of the Two Sicilies. Ever since the Norman Conquest they had formed a province apart. Temperament, custom, and tradition separated the inhabitants, as far as it was possible, from the sober people of the north. The national parliament had to contend with brigandage encouraged by the clergy, with deeply-rooted antipathies of race, with the discontent of disbanded officials, and with the multitudinous obstacles which a demoralized society offers to strict government. Upper Italy alone was educated for political existence. Elsewhere the bad government of centuries had made the people permanently hostile to the state, while corruption rendered them untrustworthy as agents. Therefore the business of the country had to be conducted by the Piedmontese. Yet this important fact was neglected in the composition of the parliament, where a due preponderance had not been secured for the colleges of Northern Italy. It was impossible not to own that the work of emancipation and annexation had progressed too quickly. To add to the difficulty, Italy lost her greatest statesman at this juncture. On the 5th of June, 1861, Cavour died with the words "A free church in a free state" upon his lips. The last months of his life had been given to planning the peaceable acquisition of Rome by treaty with the pope and Louis Napoleon.

Completion of Italian independence.

What remains of Italian history between 1861 and 1870 may be briefly told. Ricasoli formed a conservative Government after Cavour's death, and Rattazzi led the opposition. Garibaldi, who vowed never to rest till Rome and Venice had been liberated, headed the party of action. In 1862 he raised a volunteer army and invaded Sicily. Louis Napoleon regarded this as a menace to Rome, and ordered Rattazzi, who was now in power, to check his progress. Cialdini marched to Reggio, where the royal troops were defeated by the volunteers on the 28th of September, 1862. Next day Garibaldi was attacked and beaten at Aspromonte by General Pallavicini. He retired, wounded, to Caprera, whence he published his defence. The blame was seen to lie with Rattazzi, who had thought to follow Cavour's policy of masterly inaction without first settling with France. The sympathy of Europe with Italy was so great after this disaster that in September, 1864, Louis Napoleon agreed to a gradual withdrawal of French troops from Rome, provided Italy respected what remained of the pope's temporal power. By the same convention Florence became the capital. This was a good step in advance towards the annexation of Rome. In 1866 the Austro-Prussian war gave a new opportunity to the Italians. They entered into alliance with Prussia, and marched an army across the Mincio. The defeats of Custozza, Monte Suello, and Lissa deprived the Italian troops of any claim to military or naval glory in this war. But the Prussian victory of Königgratz secured the main objects for which they fought. Venice, with the Quadrilateral, was joined to the Italian kingdom, while Austria kept her Istrian and Dalmatian provinces.

In accordance with the September convention, Louis Napoleon withdrew his garrison from Rome in 1866. This event inflamed the party of action. Mazzini called upon the people to seize the Eternal City; and Garibaldi in 1867 declared his resolve to take Rome or die. Rattazzi, who was again in power, once more attempted the policy which had failed him in 1862. He ignored the obligation which bound Vittorio Emmanuele to defend the papal frontiers, and he hoped that France would tolerate a volunteer invasion. He was mistaken. Louis Napoleon interfered, and the Italian cabinet was forced to discountenance the further proceedings of the volunteers. Disturbances occurred in Rome, and Garibaldi gained a victory at Monte Rotondo. Meanwhile the king appealed to the Italians to preserve his honor, and the emperor sent a new garrison to Rome. Garibaldi's volunteers surrendered at Mentana, on the 4th of November, to the French and papal troops; and, while the general was retiring to Caprera, he was arrested by order of the Italian Government at Figline. But the end was now not distant.

Vittorio Emmanuele enters Rome.

When the victory of Sedan overthrew the French empire in September, 1870, Jules Favre declared the September convention to be at an end; Vittorio Emmanuele was released from his obligations, and on the 20th he entered Rome, which now became his capital. Pius IX. was allowed to retain the Vatican with its dependencies, the church of Sta. Maria Maggiore, and Castel Gandolfo on the Alban hill. The state voted him a munificent income, and he was left in peace to play the part of a persecuted prisoner. Thus ended the emancipation of Italy; nor did the events of the following ten years alter the situation created by the king's occupation of Rome in 1870. Vittorio Emmanuele died and was succeeded by his son Umberto in 1878. Pius IX. died the same year, and was succeeded by Leo XIII. The history of Italy during this period has been confined to internal affairs.

Bibliography.—It is difficult to indicate in a short space the most important sources of Italian as distinguished from imperial or ecclesiastical history. Muratori's great collection of *Rerum Italicarum Scriptores*, in combination with his *Dissertationes*, the chronicles and other historical material published in the *Archivio Storico Italiano*, and the works of those detached annalists of whom the *Villani* are the most notable take the first rank. Next may be mentioned Muratori's *Annali d'Italia*, together with Guicciardini's *Storia d'Italia*, and its continuation by Carlo Botta. Troya's *Storia d'Italia del Medio Evo* and Sismondi's *Républiques Italiennes* form perhaps the most valuable modern contributions to the history of the whole peninsula. Ferrari's *Rivoluzioni d'Italia* deserves special notice, as a work of singular vigor, though of less scientific value; and Cesare Balbo's *Sommario* presents the main outlines of the subject with brevity and clearness. With regard to the history of separate provinces, it may suffice to notice the *Storia Fiorentina* of Machiavelli and Corio's *Storia di Milano*, Capponi's *Storia della Repubblica di Firenze*, Colletta's *History of Naples*, Romanin's *History of Venice*, Amari's *Musulmani di Sicilia*, and the *Stadt Rom* of Gregorovius. From the point of view of papal history, Von Ranke's *History of the Popes* is distinguished for exact insight into one epoch of Italian development. From the point of view of biography, Von Reumont's *Lorenzo de' Medici* and Villari's *Savonarola* and *Machiavelli* are equally instructive. From the point of view of general culture Burckhardt's *Cultur der Renaissance in Italien*, Quinet's *Révolutions d'Italie*, and J. A. Symonds's *Renaissance in Italy*, 5 vols., may prove of service. No comprehensive work can be indicated for the history of Italy during the present century, though Reuchlin's *Geschichte Italiens*, Treitschke's *Essay on Cavour*, and Massari's *Life of Cavour* supply important materials. (J. A. S.)

PART III.—LANGUAGE.

The Italian language is the language of culture in the whole of the present kingdom of Italy, in some parts of Switzerland (the canton of Ticino and part of the Grisons), in some parts of the Austrian territory (the districts of Trent and Görz, Istria along with Trieste, and the Dalmatian coast), and in the islands of Corsica and Malta. In the Ionian Islands, likewise, in the maritime cities of the Levant, in Egypt, and more particularly in Tunis, this literary language is extensively maintained through the numerous Italian colonies and the ancient traditions of trade.

The Italian language has its native seat and living source in Middle Italy, or more precisely Tuscany and indeed Florence. For real linguistic unity is far from existing in Italy: in some respects the variety is less in others more observable than in other countries which equally boast a political and literary unity. Thus, for example, Italy affords no linguistic contrast so violent as that presented by Great Britain with its English dialects alongside of the Celtic dialects of Ireland, Scotland, and Wales, or by France with the French dialects alongside of the Celtic dialects of Brittany, not to speak of the Basque of the Pyrenees and other heterogeneous elements. The presence of not a few Slavs stretching into the district of Udine (Friuli), of Albanian, Greek, and Slav settlers in the southern provinces, with the Catalans of Alghero (Sardinia), a few Germans at Monte Rosa, and a remnant or two of other comparatively modern immigrations is not sufficient to produce any such strong contrast in the conditions of the national speech. But, on the other hand, the Neo-Latin dialects which live on side by side in Italy differ from each other much more markedly than, for example, the English dialects or the Spanish; and it must be added that, in Upper Italy especially, the familiar use of the dialects is tenaciously retained even by the most cultivated classes of the population.

In the present rapid sketch of the forms of speech which occur in modern Italy, before considering the Tuscan or Italian *par excellence*, the language which has come to be the noble organ of modern national culture, it will be convenient to discuss (A) dialects connected in a greater or less degree with Neo-Latin systems that are not peculiar to Italy; (B) dialects which are detached from the true and proper Italian system, but form no integral part of any foreign Neo-Latin system; and (C) dialects which diverge more or less from the true Italian and Tuscan type, but which at the same time can be conjoined with the Tuscan as forming part of a special system of Neo-Latin dialects.

A. *Dialects which depend in a greater or less degree on Neo-Latin systems not peculiar to Italy.*

1. *Franco-Provençal Dialects* (see *Archivio Glottologico*, iii. 61–120).[1]—These occupy at the present time very limited areas at the extreme north-west of the kingdom of Italy. The system stretches from the borders of Savoy and Valais into the upper basin of the Dora Baltea and into the head-valleys of the Orco, of the northern Stura, and of the Dora Riparia. As this portion is cut off by the Alps from the rest of the system, the type is badly preserved; in the valleys of the Stura and the Dora Riparia, indeed, it is passing away and everywhere yielding to the Piedmontese. —The most salient characteristic of the Franco-Provençal is the phonetic phenomenon by which the Latin *a*, whether as an accented or as an unaccented final, is reduced to a thin vowel (*ẹ*, *i*) when it follows a sound which is or has been palatal, but on the contrary is kept intact when it follows a sound of another sort. The following are examples from the Italian versant of these Alps:—Aosta: *travaljí*, Fr. travailler; *zarźí*, Fr. chercher; *enteruźí*, Fr. interroger; *zẹvra*, Fr. chèvre; *zir*, Fr. cher; *gljáçẹ*, Fr. glace; *vázze*, Fr. vache; alongside of *sa*, Fr. sel; *maṅ*, Fr. main; *epóusa*, Fr. épouse; *erba*, Fr. herbe. Val Soana: *taljér*, Fr. tailler; *coćí-sse*, Fr. se coucher; *ćiṅ*, Fr. chien; *ćivra*, Fr. chèvre; *vaćći*, Fr. vache; *mánǵi*, Fr. manche; alongside of *alár*, Fr. aller; *portá*, Fr. porté; *amára*, Fr. amère; *néva*, Fr. neuve. Chiamorio (Val di Lanzo): *la spranssi dla vendeta*, sperantia de illa vindicta. Viu: *pansci*, pancia. Usseglio: *la müragli*, muraille.—A morphological characteristic is the preservation of that paradigm which is legitimately traced back to the Latin pluperfect indicative, although possibly it may arise from a fusion of this pluperfect with the imperfect subjunctive (amaram, amarem, alongside of habueram, haberem), having in Franco-Provençal as well as in Provençal and in the continental Italian dialects in which it will be met with further on (C. 3, *b*; *cf*. B. 2) the function of the conditional. Val Soana: *portáro*, *portáre*, *portáret*; *portárǫnt*; Aosta: *ávre* = Prov. *agra*, haberet (see *Arch.*, iii. 31 *n*). The final *t* in the third persons of this paradigm in the Val Soana dialect is, or was, constant in the whole conjugation, and becomes in its turn a particular characteristic in this section of the Franco-Provençal. Val Soana: *éret*, Lat. erat; *sejt*, sit; *pórtet*, *portávet*; *portǫnt*, *portávǫnt*; Chiamorio: *jéret*, erat; *ant dit*, habent dictum; *èjssount fét*, habuissent factum; Viu: *che s'mínget*, Ital. che si mangi; Gravere (Val di Susa): *at pensá*, ha pensato; *avát*, habebat; Giaglione (sources of the Dora Riparia): *maciávont*, mangiavano.—From the valleys, where, as has just been said, the type is disappearing, a few examples of what is still genuine Franco-Provençal may be subjoined:—*Ćivreri* (the name of a mountain between the Stura and the Dora Riparia), which, according to the regular course of evolution, presupposes a Latin *Capraria* (*cf. maneri*, maniera, even in the Chiamorio dialect); *ćarastí* (*ciaṛastì*), carestia, in the Viu dialect; and *ćintá*, cantare, in that of Usseglio. From Chiamorio, *li téns*, i tempi, and *chejches birbes*, alcune (qualche) birbe, are worthy of mention on account of the final *s*.

Further south, but still in the same western extremity of Piedmont, phenomena continuous with those of the Maritime Alps supply the means of passing from the Franco-Provençal to the Provençal proper, precisely as the same transition takes place beyond the Cottian Alps in Dauphiné almost in the same latitude. On the Italian side of the Cottian and the Maritime Alps the Franco-Provençal and the Provençal are connected with each other by the continuity of the phenomenon *ć* (a pure explosive) from the Latin *c* before *a*. At Oulx (sources of the Dora Riparia), which seems, however, to have a rather mixed dialect, there also occurs the important Franco-Provençal phenomenon of the surd interdental (English *th* in *thief*) instead of the surd sibilant (for example *ithí* = Fr. ici). At the same time *agü* = avuto, takes us to the Provençal. At Fenestrella (upper basin of the Clusone): *agü*, *vengü*, venuto; at Oncino (sources of the Po): *ćarestio*, *l'ero an campagno*, with the Provençal *o* for the final unaccented *a*; at Sampeyre (basin of the Variáta): *agü*, *vengü*, *volgü*, voluto; *üna viestio la plüs pressioso*; and finally at Vinadio (basin of the southern Stura): *tuóccio*, tocca; *los buónos*, le buone, where even the diphthong is Provençal.

2. *Ladin Dialects.*—The purest of the Ladin dialects occur on the northern versant of the Alps in the Grisons (Switzerland), and they form the western section of the system. To this section also belongs both politically and in the matter of dialect the valley of Münster (Monastero); it sends its waters to the Adige, and might indeed consequently be geographically considered Italian, but it slopes towards the north. In the central section of the Ladin zone there are two other valleys which likewise drain into tributaries of the Adige, but are also turned towards the north,—the valleys of the Gardẹna and the Gadera, in which occurs the purest Ladin now extant in the central section. The valleys of Münster, the Gardena, and the Gadera may thus be regarded as inter-Alpine, and the question may be left open whether or not they should be included even geographically in Italy. There remain, however, within what are strictly Italian limits, the valleys of the Noce, the Avisio, the Cordevole, and the Boite, and the upper basin of the Piave (Comelico), in which are preserved Ladin dialects, more or less pure, belonging to the central section of the Ladin zone or belt. To Italy belongs, further, the whole eastern section of the zone composed of the Friulian territories. It is by far the most populous, containing about 500,000 inhabitants. The Friulian region is bounded on the north by the Carnic Alps, south by the Adriatic, and west by the eastern rim of the upper basin of the Piave and the Livenza; while on the east it stretches into the eastern versant of the basin of the Isonzo.—The Ladin element is further found in greater or less degree throughout an altogether Cis-Alpine "amphizone," and more particularly in the head valley of the Ticino and the head valley of the Mera on the Lombardy versant, and in the Val Fiorentina and central Cadore on the Venetian versant. The valleys of Bormio present a special and conspicuous phase of Ladino-Lombard connections, and the Ladin element is clearly observable in the most ancient examples of the dialects of the Venetian estuary (*Arch.*, i. 448–473).—The main characteristics by which the Ladin type is determined may be summarized as follows:—(1) the guttural of the formulæ $c + a$ and $g + a$ passes into a palatal; (2) the *l* of the formulæ *pl*, *cl*, etc., is preserved; (3) the *s* of the ancient terminations is preserved; (4) the accented *e* in position breaks into a diphthong; (5) the accented *o* in position breaks into a diphthong; (6) the form of the diphthong which comes from short accented *o* or from the *o* of position is *ue* (whence *üe*, *ö*); (7) long accented *e* and short accented *i* break into a diphthong, the purest form of which is sounded *ei*; (8) the accented *a* tends, within certain limits, to change into *e*, especially if preceded by a palatal sound; (9) the long accented *u* is represented by *ü*. These characteristics are all foreign to true and genuine Italian. *Ćárn*, carne; *spelunća*, spelunca; *clefs*, claves; *fuormas*, formæ; *infiern*, inferno; *ördi*, hordeo; *möd*, modo; *plain*, pleno; *pail*, pilo; *quæl*, quale; *pür*, puro—may be taken as examples from the Upper Engadine (western section of the zone). The following are examples from the central and eastern sections on the Italian versant:—

a. Central Section.—Basin of the Noce: examples of the dialect of Fondo: *ćavél*, capillo; *pesćadór*, piscatore; *pluévia*, pluvia (plovia); *pluma*, (dial. of Val de Rumo: *plövia*, *plümo*); *vécla*, vetula; *ćántes*, cantas. The dialects of this basin are disappearing.—Basin of the Avisio: examples of the dialect of the Val di Fassa: *ćarn*, carne; *ćéžer*, cadere (cad-jere); *váća*, vacca; *fórća*, furca; *gléžia* (*ǵéžia*), ecclesia; *œ́ǵlje* (*œje*), oculi; *ćans*, canes; *rámes*, rami; *teila*, tela; *néif*, nive; *cœssa*, coxa. The dialects of this basin which are further west than Fassa are gradually being merged in the Veneto-Tridentine dialects.—Basin of the Cordevole: here the district of Livinal-Lungo (Buchenstein) is Austrian politically, and that of Rocca d'Agordo and Laste is Italian. Examples of the dialect of Livinal-Lungo: *ćarié*, Ital. caricare; *ćanté*, cantatus; *ógle*, oculo; *ćans*, canes; *ćavéis*, capilli; *viérm*, verme; *fŭóc*, foco; *avḗl*, habere; *néi*, nive.—Basin of the Boite: here the district of Ampezzo (Heiden) is politically Austrian, that of Oltrechiusa Italian. Examples of the dialect of Ampezzo are *ćasa*, casa; *ćandéra*, candela; *fórćes*, furcæ, pl.; *séntes*, sentis. It is a decadent form.—UPPER BASIN OF THE PIAVE: dialect of the Comelico: *ćésa*, casa; *ćen* (ćan), cane; *ćaljé*, caligario; *bos*, boves; *nœvo*, novo; *lœgo*, loco.

---

[1] References to this journal (*Arch.*) without author's name are to papers by Professor Ascoli.

b. Eastern Section or Friulian Region.—Here there still exists a flourishing "Ladinity," but at the same time it tends towards Italian, particularly in the want both of the *e* from *á* and of the *ü* (and consequently of the ö). Examples of the Udińe variety: *ćarr*, carro; *ćavál*, caballo; *ćastiél*, castello; *fórće*, furca; *clar*, claro; *glaç*, glacie; *plan*, plano; *colors*, colores; *lungs*, longi, pl.; *dévis*, debes; *vidiél*, vitello; *fiéste*, festa; *puéss*, possum; *cuétt*, cocto; *uárdi*, hordeo.—The most ancient specimens of the Friulian dialect belong to the 14th century (see *Arch.*, iv. 188 *sqq.*)

B. *Dialects which are detached from the true and proper Italian system, but form no integral part of any foreign Neo-Latin system.*

1. Here first of all is the extensive system of the dialects usually called *Gallo-Italian*, although that designation cannot be considered sufficiently distinctive, since it would be equally applicable to the Franco-Provençal (A. 1) and the Ladin (A. 2). The system is subdivided into four great groups,—(*a*) the *Ligurian*, (*b*) the *Piedmontese*, (*c*) the *Lombard*, and (*d*) the *Emilian*,—the names furnishing on the whole sufficient indication of the localization and limits.—These groups, considered more particularly in their more pronounced varieties, differ greatly from each other; and, in regard to the Ligurian, it was even denied until very recently that it belongs to this system at all (see *Arch.*, ii. 111 *sqq.*).—Characteristic of the Piedmontese, the Lombard, and the Emilian is the continual elision of the unaccented final vowels except *a* (*e.g.*, Turinese *öj*, oculo; Milanese *vọç*, voce; Faenzan *red*, rete), but the Ligurian does not keep them company (*e.g.* Genovese *öǵǵu*, oculo; *vọže*, voce). In the Piedmontese and Emilian there is further a tendency to eliminate the protonic vowels—a tendency much more pronounced in the second of these groups than in the first (*e.g.* Pied. *dné*, danaro; *vžin*, vicino; Faenzan *fnoćć*, finocchio; *dsprazion*). This phenomenon involves in large measure that of the prothesis of *a*; as, *e.g.*, in Turinese and Faenzan *armor*, rumore; Faenzan *alvé*, levare; etc. *Ü* for the long accented Latin *u* and *ö* for the short accented Latin *o* (and even within certain limits the Latin *ó* of position) are common to the Piedmontese, the Ligurian, and the Lombard: *e.g.*, Turinese and Milanese, *dür*, and Genovese *düu*, duro; Turinese and Genovese, *möve*, and Milanese *möv*, móvere; Piedmontese *dörm*, dorme; Milanese, *völta*, volta. *Ei* for the long accented Latin *e* and for the short accented Latin *i* is common to the Piedmontese and the Ligurian, and even extends over a large part of Emilia: *e.g.*, Turinese and Genovese, *avéi*, habere, Bolognese, *avéir*; Turinese and Genovese, *beive*, bibere, Bolognese, *beir*. In Emilia *ei* occurs also in the formulæ *ĕn, ent, emp*; *e.g.*, Bolognese and Modenese *beiṅ*, *sọlaméiṅt*. The system shows a repugnance throughout to *ie* for the short accented Latin *e* (as it occurs in Italian *piede*, etc.); in other words, this diphthong has died out, but in various fashions: Piedmontese and Lombard *deç*, dieci; Genovese *deže*; Faenzan *diç*. The greater part of the phenomena indicated above have "Gallic" counterparts too evident to require to be especially pointed out. One of the most important traces of Gallic or Celtic reaction is the reduction of the Latin accented *a* into *e* (*ä*, etc.), of which phenomenon, however, no certain indications have as yet been found in the Ligurian group. On the other hand it remains, in the case of very many of the Piedmontese dialects, in the *é* of the infinitives of the first conjugation: *porté*, portare, etc.; and numerous vestiges of it are still found in Lombardy (*e.g.*, in Bassa Brianza: *andǽ*, andato; *guardǽ*, guardato; *sǽ*, sale; see *Arch.* i. 296–298, 536). Emilia also preserves it in very extensive use: Modenese *andér*, andare; *arivéda*, arrivata; *peç*, pace; Faenzan *parlé*, parlare and parlato; *parléda*, parlata; *ches*, caso; etc. The phenomenon, in company with other Gallo-Italian and more especially Emilian characteristics, extends to the valley of the Metauro, and even passes to the opposite side of the Apennines, spreading on both banks of the head stream of the Tiber and through the valley of the Chiane; hence the types *artrovér*, ritrovare, *portéto*, portato, etc., of the Perugian and Aretine dialects (see *infra* C. 3, *b*). In the phenomenon of *á* passing into *e* (as indeed, the Gallo-Italic evolution of other Latin vowels) special distinctions would require to be drawn between bases in which *a* (not standing in position) precedes a non-nasal consonant (*e.g.*, *amáto*), and those which have *a* before a nasal; and in the latter case there would be a non-positional subdivision (*e.g.*, *fáme, páne*) and a positional one (*e.g.*, *quánto, amándo, cámpo*); see *Arch.* i. 293 *sqq.* This leads us to the nasals, a category of sounds comprising other Gallo-Italic characteristics. There occurs more or less widely, throughout all the sections of the system, and in different gradations, that "velar" nasal in the end of a syllable (*paṅ, maṅ*; *cáṅta, moṅt*) which may be weakened into a simple nasalizing of a vowel (*pã*, etc.) or even grow completely inaudible (Bergamese *pa*, pane; *padrú*, padrone; *tep*, tempo; *met*, mente; *mut*, monte; *pût*, ponte; *púća*, punta, *i.e.*, "puncta"), where Celtic and especially Irish analogies and even the frequent use of *t* for *nt*, etc., in ancient Umbrian orthography occur to the mind. Then we have the faucal *n* by which the Ligurian and the Piedmontese (*laṅa, lüṅa*, etc.) are connected with the group which we call Franco-Provençal (A. 1).—We pass on to the "Gallic" resolution of the nexus *ct* (*e.g.*, *facto*, fajto, fajtjo, *fait, fać*; *tecto*, tejto, tejtjo, *teit, teć*) which invariably occurs in the Piedmontese, the Ligurian, and the Lombard: Pied. *fáit*, Lig. *fajtu, fætu*, Lombard *fać*; Pied. *téit*, Lig. *téitu*, Lom. *teć*; etc. Here it is to be observed that besides the Celtic analogy the Umbrian also helps us (*aḍveitu* = ad-vecto; etc.); and it is further most noteworthy that the Celtic and Umbrian analogies lead us to that fusion of the *ct* series with the *pt* series (Irish *secht*, Welsh *seith*, septem; Umbrian, *screhto, screihtor*, scriptum, scripti) by which is explained the *scrić*, scripto, of the ancient Milanese, *scrićüra*, scriptura, of the modern; just as also Provençal has *escrich* (*i.e. escrić*).—The Piedmontese and Ligurian come close to each other, more especially by the regular dropping of the *d* both primary and secondary, a phenomenon common in French (as Piedmontese and Ligurian *ríe*, ridere; Piedmontese *pué*, potare; Genoese *næghe* = náighe, nátiche, etc.). The Lombard type, or more correctly the type which has become the dominant one in Lombardy (*Arch.*, i. 305–6, 310–11), is more sparing in this respect; and still more so is the Emilian. In the Piedmontese is also found that other purely Gallic resolution of the guttural between two vowels by which we have the types *brája, mánia*, over against the Ligurian *brága, mánega*, braca, manica.—Among the phonetic phenomena peculiar to the Ligurian is a continual reduction of *l* into *r* and the subsequent dropping of this *r* between vowels and at the end of words in the modern Genoese; just as happens also with the primary *r*: thus *dû* = durúr = dolore, etc. Characteristic of the Ligurian, but not without analogies in Upper Italy even (*Arch.*, ii. 157–8), is the resolution of *pj, bj, fj* into *ć, ǵ, š*: *ćü*, più, plus; *ráǵǵa*, rabbia, rabies; *šû*, fiore. Finally, the sounds *š* and *ž* have a very wide range in Ligurian (*Arch.*, ii. 158–59). The reduction of *s* into *h* occurs in the Bergamo dialects: *hira*, sera; *groh*, grosso; *cahtél*, castello (see also B. 2).—A general phenomenon in Gallo-Italic phonetics which also comes to have an inflectional importance is that by which the unaccented final *i* has an influence on the accented vowel. This enters into a series of phenomena which even extends into southern Italy; but in the Gallo-Italic there are particular resolutions which agree well with the general connections of this system. The following plural forms may be quoted: Genoese *bóin*, from *bón-i*; *tróin*, from *tron-i*, tuoni; Milanese *quist*, from *quist-i* (sing. *quest*), questi; *mis* from *mes-i*, mesi (sing. *mes*); Bolognese *riñ*, from *reñ-i*, regni (sing. *reñ*); *cf.* *Arch.*, i. 540–41.—Among morphological peculiarities the first place may be given to the Bolognese *sipa* (*seppa*), because, thanks to Dante and others, it has acquired great literary celebrity. It really signifies "sia" (sim, sit), and is an analogical form fashioned on *æpa*, a legitimate continuation of the corresponding forms of the other auxiliary (habeam, habeat), which is still heard in *ch'me æpa, purtǽ*, *ch'lu æpa purtǽ*, ch'io abbia portato, ch'egli abbia portato. Next may be noted the third person singular in *-p* of the perfect of *esse* and of the first conjugation in the Forlì dialect (*fop*, fu; *mandép*, mandò; etc.). This also must be analogical, and due to a legitimate *ep*, ebbe (see *Arch.*, ii. 401, and compare *fobbe*, fu, in the dialect of Camerino, in the province of Macerata, as well as the Spanish analogy of *tuve estuve* formed after *hube*). Lastly, in the domain of syntax, may be added the tendency to repeat the pronoun (*e.g.*, *ti te cántet* of the Milanese, which really is *tu tu cántas-tu*, equivalent merely to "cantas"), a tendency at work in the Emilian and Lombard, but more particularly pronounced in the Piedmontese. With this the corresponding tendency of the Celtic languages has been more than once and with justice compared; here it may be added that the Milanese *nün*, apparently a simple form for "noi," is really a compound or reduplication in the manner of the *ni-ni*, its exact counterpart in the Celtic tongues.—The literary documents of this system go back as far as the end of the 13th century in the Milanese poems of Fra Bonvicino da Riva and the *Rime Genovesi* (*Arch.*, ii. 161–312).

2. *Sardinian Dialects.*—These are three—the Logudorese or central, the Campidanese or southern, and the Gallurese or northern. The third certainly indicates a Sardinian

basis, but is strangely disturbed by the intrusion of other elements, among which the Southern Corsican (Sartene) is by far the most copious. The other two are homogeneous, and have great affinity with each other; the Logudorese comes more particularly under consideration here.—The pure Sardinian vocalism has this peculiarity that each accented vowel of the Latin appears to be retained without alteration. Consequently there are no diphthongs representing simple Latin vowels; nor does the rule hold good which is true for so great a proportion of the Romance languages that the representatives of the ĕ́ and the ĭ́ on the one hand and those of the ŏ́ and the ŭ́ on the other are normally coincident. Hence *plenu* (ē); *deghe*, decem (ĕ); *binu*, vino (ī); *pilu* (ĭ); *flore* (ō); *roda*, rota (ŏ); *duru* (ū); *nug̣he*, nuce (ŭ). The unaccented vowels keep their ground well, as has already been seen in the case of the finals by the examples adduced.—The *s* and *t* of the ancient termination are preserved, though not constantly: *tres*, *onus*, *passados annos*, *plantas*, *faghes*, facis, *tenemus*; *mulg̣het*, *mulg̣hent*.—The formulæ *ce*, *ci*, *ge*, *gi* may be represented by *che* (*ke*), etc.; but this appearance of special antiquity is really illusory (see *Arch.*, ii. 143–4). The nexus *cl*, etc., may be maintained in the beginning of words (*claru*, *plus*); but if they are in the body of the word they usually undergo resolutions which, closely related though they be to those of Italian, sometimes bring about very singular results (*e.g.*, *ušare*, which by the intermediate forms *usćare*, *usjare* leads back to *usclare* = *ustlare* = *ustulare*). *Nź* is the representative of *nj* (*testimónźu*, etc.); and *lj* is reduced to *ź* alone (*e.g.*, *méźus*, melius; Campidanese *mellus*). For *ll* a frequent substitute is *ḍḍ*: *massiḍḍa*, maxilla, etc. Quite characteristic is the continual labialization of the formulæ *qua*, *gua*, *cu*, *gu*, etc.; *e.g.*, *ebba*, equa; *sambene*, sanguine (see *Arch.*, ii. 143). The dropping of the primary *d* (*roere*, rodere, etc.) but not of the secondary (*finidu*, *sanidade*, *maduru*) is frequent. Characteristic also is the Logudorese prothesis of *i* before the initial *s* followed by a consonant (*iscamnu*, *istella*, *ispada*), like the prothesis of *e* in Spain and in France (see *Arch.*, iii. 447 *sqq.*).—In the order of the present discussion it is in connection with this territory that we are for the first time led to consider those phonetic changes in words of which the cause is merely syntactical or transitory, and chiefly those passing accidents which occur to the initial consonant through the historically legitimate or the merely analogical action of the final sound that precedes it. The general explanation of such phenomena reduces itself to this that, given the intimate syntactic relation of two words, the initial consonant of the second retains or modifies its character as it would retain or modify it if the two words were one. The Celtic languages are especially distinguished by this peculiarity; and among the dialects of Upper Italy the Bergamasc offers a clear example. This dialect is accustomed to drop the *v*, whether primary or secondary, between vowels in the individual vocables (*caá*, cavare; *fáa*, fava, etc.), but to preserve it if it is preceded by a consonant (*serva*, etc.).—And similarly in syntactic combination we have, for example, *de i*, di vino; but *ol vi*, il vino. Insular, southern, and central Italy furnish a large number of such phenomena; for Sardinia we shall simply cite a single class, which is at once obvious and easily explained, viz., that represented by *su oe*, il bove, alongside of *sos boes*, i buoi (*cf.* *bíere*, bibere; *erba*). The article is derived from *ipse* instead of from *ille*: *su*, *sos*, *sa*, *sas*,—again a geographical anticipation of Spain, which in the Catalan of the Balearic islands still preserves the article from *ipse*. A special connection with Spain exists besides in the *nomine* type of inflection, which is constant among the Sardinians (Spanish *nomne*, etc., whence *nombre*, etc.), *nomen*, *nomene*, *rámine*, aeramine, *leg̣umene*, etc. (see *Arch.*, ii. 429 *sqq.*).—Especially noteworthy in the conjugation of the verb is the paradigm *cantére*, *cantéres*, etc., *timére*, *timéres*, etc., precisely in the sense of the imperfect subjunctive (*cf.* A. 1; *cf.* C. 3 b). Next comes the analogical and almost corrupt diffusion of the *-si* of the ancient strong perfects (such as *posi*, *rosi*), by which *cantesi*, *timesi* (cantavi, timui), *dolfesi*, dolui, are reached. Proof of the use and even the abuse of the strong perfects is afforded, however, by the participles and the infinitives of the category to which belong the following examples: *ténnidu*, tenuto; *párfidu*, parso; *bálfidu*, valso; *ténnere*, *bálere*, etc. (*Arch.*, ii. 432–33). The future, finally, shows the unagglutinated periphrasis: *hapo a mandig̣are* (ho a mangiare = manger-ó); as indeed the unagglutinated forms of the future and the conditional occur in ancient vernacular texts of other Italian districts.—There are documents of the Sardinian dialect going back as far as the middle of the 12th century.

C. *Dialects which diverge more or less from the genuine Italian or Tuscan type, but which at the same time can be conjoined with the Tuscan as forming part of a special system of Neo-Latin dialects.*

1. *Venetian.*—Between "Venetian" and "Venetic" several distinctions must be drawn (*Arch.*, i. 391 *sqq.*). At the present day the population of the Venetian cities is "Venetian" in language, but the country districts are in various ways Venetic.[1] The ancient language of Venice itself and of its estuary was not a little different from that of the present time; and the Ladin vein was particularly evident (see A. 2). A more purely Italian vein—the historical explanation of which presents an attractive problem—has ultimately gained the mastery and determined the "Venetian" type which has since diffused itself so vigorously.—In the Venetian, then, we do not find the most distinctive characteristics of the dialects of Upper Italy comprised under the denomination Gallo-Italic (see B. 1),—neither the *ü* nor the *ö*, nor the velar and faucal nasals, nor the Gallic resolution of the *ct*, nor the frequent elision of unaccented vowels, nor the great redundancy of pronouns. On the contrary, the pure Italian diphthong of ŏ́ (*e.g.*, *cuór*) is heard, and the diphthong of ĕ́ is in full currency (*diéźe*, dieci, etc.). Nevertheless the Venetian approaches the type of Northern Italy, or diverges notably from that of Central Italy, by the following phonetic phenomena:—the ready elision of primary or secondary *d* (*crúo*, crudo; *séa*, seta, etc.); the regular reduction of the surd into the sonant guttural (*e.g.*, *cuogo*, Ital. cuoco, coquus); the pure *ć* in the resolution of *cl* (*e.g.*, *ćave*, clave; *oréća*, auricula); the *ź* for *ǵ* (*źóvene*, Ital. giovane); *ç* for *ś* and *ć* *péçe*, Ital. pesce; *çiél*, Ital. cielo). *Lj* preceded by any vowel, primary or secondary, except *i*, gives *ǵ*: *faméǵa*, familia. No Italian dialect is more averse than the Venetian to the doubling of consonants.—In the morphology the use of the 3d singular for the 3d plural also, and the analogical participle in *esto* (*taźesto*, Ital. taciuto, etc.; see *Arch.*, iv. 393 *sqq.*) are particularly noteworthy. A curious double relic of Ladin influence is the interrogative type represented by the example *crédis-tu*, credis tu,—where apart from the interrogation *ti credi* would be used.—The texts of the Venetian vernacular take us back to the first half of the 13th century. To the beginning of the 14th belongs the *Trattato* "*de regimine rectoris*" of Fra Paolino, also in the Venetian dialect. For other ancient sources relating to Venice, the estuary of Venice, Verona, and Padua, see *Arch.*, i. 448, 465, 421–22; iii. 245–47.

2. *Corsican.*—If the "Venetian," in spite of its peculiar "Italianity," has naturally special points of contact with the other dialects of Upper Italy (B. 1), the Corsican in like manner, particularly in its southern varieties, has special points of contact with Sardinian proper (B. 2). Thus for example, in *boglio leche lu bunnetru* (voglio lasciar la gonnella) from a song of Fiumorban Corsican there is a phonetic phenomenen (*bu* from *gu*) which reveals a connection with Sardinian proper, as well as a morphological phenomenon which implies the same relation, since *leche* must be a verb of the first conjugation (*lagáre* in Upper Italy; see, for example, *Arch.*, i. 546) conformed to the analogy of strong verbs as found in Sardinian in the case of *nárrere*, narrare, or, for a verb of the fourth conjugation, in Corsican *véne*, Sardinian *bénnere* = venire.—In general, it is in the southern section of the island, which, geographically even, is farthest removed from Tuscany, that the most characteristic forms of speech are found. The unaccented vowels are undisturbed; but *u* for the Tuscan *o* is common to almost all the island,—an insular phenomenon *par excellence* which connects Corsica with Sardinia and with Sicily, and indeed with Liguria also. So also *-i* for the Tuscan *-e* (*latti*, latte; *li cateni*, le catene), which prevails chiefly in the southern section, is also found in Southern Sardinian, and is common to Sicily. It is needless to add that this tendency to *u* and *i* manifests itself, more or less decidedly, also within the words. Corsican, too, avoids the diphthongs of ĕ́ and ŏ́ (*pe*, *eri*; *cori*, *fora*); but, unlike Sardinian, it treats ĭ́ and ŭ́ in the Italian fashion: *beju*, bibo; *péveru*, piper; *pesci*; *noci*, nuces.—It is one of its characteristics to reduce *a* to *e* in the formula *ar* + a consonant (*chérne*, *bérba*, etc.), which should be compared particularly with the Emilian examples of the same phenomenon (*Arch.*, ii. 133, 144–50). But the gerund in *-endu* of the first conjugation (*turnendu*, *lagrimendu*, etc.) must on the contrary be considered as a phenomenon of analogy, as it is especially recognized in the Sardinian dialects, to all of which it is common (see *Arch.*, ii. 133). And the same is most probably the case with forms of the present participle like *merchente*, mercante, in spite of *enzi* and *innenzi* (anzi, innanzi), in which latter forms there may probably be traced the effect of the Neo-

---

[1] On this point see the chapter, "La terra ferma veneta considerata in ispecie ne' suoi rapporti con la sezione centrale della zona ladina," in *Arch.*, i. 406–47.

Latin *i* which availed to reduce the *t* of the Latin *ante*; alongside of them we find also *anzi* and *nantu*.—In Southern Corsican *dr* for *ll* is conspicuous—a phenomenon which also connects Corsica with Sardinia, Sicily, and a good part of Southern Italy (see C. 2; and *Arch.* ii. 135, etc.) An acute observer (Falcucci) has asserted that even the phenomena of *rn* and *nd* both changing into *nn* are found in certain veins of Southern Corsican; but he has given no examples. The former of these would connect Corsican with Sardinian (*corru*, cornu; *carre*, carne, etc.); the latter more especially with Sicily, etc., though it is not unknown even in Sardinia (*Arch.*, ii. 142, 143).—As to phonetic phenomena connected with syntax, already noticed in B. 2, space admits the following examples only: Cors. *na vella*, una bella, *e bella* (*ebbélla*, et bella); *lu jallu*, lo gallo, *gran ghiallu; cf. Arch.*, ii. 136 (135, 150). As Tommaseo has already noted, *-one* is for the Corsicans not less than for the French a termination of diminution: *e.g.*, *fratedronu*, fratellino.—In the first person of the conditional the *b* is maintained (*e.g.*, *farebe*, farei), as even at Rome and elsewhere. Lastly, the series of Corsican verbs of the derivative order which run alongside of the Italian series of the original order, and may be represented by the example *dissipeghja*, dissipa (Falcucci), is to be compared with the Sicilian series represented by *cuadiari*, riscaldare, *curpiári*, colpire (*Arch.*, ii. 151).

3. *Dialects of Sicily and of the Neapolitan Provinces.*—Here the territories on both sides of the Strait of Messina will first be treated together, chiefly with the view of noting their common linguistic peculiarities.—Characteristic then of these parts, as compared with Upper Italy and even with Sardinia, is, generally speaking, the tenacity of the explosive elements of the Latin basis (*cf. Arch.*, ii. 154, etc.). Not that these consonants are constantly preserved uninjured; their degradations, and especially the Neapolitan degradation of the surd into the sonant, are even more frequent than is shown by the dialect as written, but their disappearance is comparatively rather rare; and even the degradations, whether regard be had to the conjunctures in which they occur or to their specific quality, are very different from those of the dialects of Upper Italy. Thus, the *t* between vowels ordinarily remains intact in Sicilian and Neapolitan (*e.g.* Sicil. *sita*, Neap. *seta*, seta, where in the dialects of Upper Italy we should have *seda, sea*); and in the Neapolitan dialects it is reduced to *d* when it is preceded by *n* or *r* (*e.g.*, *viendẹ*, vento), which is precisely a collocation in which the *t* would be maintained intact in Upper Italy. The *d*, on the other hand, is not resolved by elision, but by its reduction to *r* (*e.g.*, Sicil. *vírire*, Neap. dialects *veré*, vedere), a phenomenon which has been frequently compared, perhaps with too little caution, with the *d* passing into *rs* (*ḍ*) in the Umbrian inscriptions. The Neapolitan reduction of *nt* into *nd* has its analogies in the reduction of *nc* (*nk*) into *ng*, and of *mp* into *mb*, which is also a feature of the Neapolitan dialects, and in that of *ns* into *nź*; and here and there we even find a reduction of *nf* into *mb* (*nf*, *nv*, *nb*, *mb*), both in Sicilian and Neapolitan (*e.g.*, at Casteltermini in Sicily *'mbiernu*, inferno, and in the Abruzzi *cumbonn'*, *'mbonn'*, confondere, infondere). Here we find ourselves in a series of phenomena to which it may seem that some special contributions were furnished by Oscan and Umbrian (*nt*, *mp*, *nc* into *nd*, etc.), but for which more secure and general, and so to say "isothermal," analogies are found in modern Greek and Albanian. The Sicilian does not appear to fit in here as far as the formulæ *nt* and *mp* are concerned; it rather agrees with the Neapolitan through *rt* passing into *rd*; and it may even be said to go counter to this tendency by reducing *nǵ* to *nć* (*e.g.*, *púnćiri*, pungere). Nay, even in the passing of the sonant into the surd, the Neapolitan dialects would yield special and important contributions (nor is even the Sicilian limited to the case just specified), among which we will only mention the change of *d* between vowels into *t* in the last syllable of proparoxytones (*e.g.*, *úmmeto*, umido). From these series of sonants changing into surds comes a peculiar feature of the southern dialects.—A pretty common characteristic is the regular progressive assimilation by which *nd* is reduced to *nn*, *mb* to *mm*, and even *nv* also to *mm* (*nv*, *nb*, *mb*, *mm*), *e.g.*, Sicil. *š́inniri*, Neap. *šénnere*, scendere; Sicil. *chiummu*, Neap. *chiummẹ*, piombo; Sicil. and Neap. *'mmidia*, invidia. As belonging to this class of phenomena the Palæo-Italic analogy (*nd* into *nn*, *n*), of which the Umbrian furnishes special evidence, readily suggests itself.—Another important common characteristic is the reduction of *pj*, *bj*, *fj* to *ć* (*kj*), *ǵ*, *š* (*cf.* the Genoese; B. 1), whence, *e.g.*, Sicil. *chianu*, Neap. *chianẹ*, piano (plano, pljano, pjano); Sicil. *sićća*, Neap. *sećća*, sepia; Sicil. *raǵǵa*, Neap. *arraǵǵa*, rabbia; Sicil. *šuri* (*ćuri*), Neap. *šore*, fiore.—Further is to be noted the tendency to the sibilation of *ce*, *ci* for which Sicil. *jazzu*, ghiaccio, and Neap. *lizetẹ*, lecito, may serve as examples (*Arch.*, ii. 149),—a tendency more particularly betrayed in Upper Italy.—There is a common inclination also to elide the initial unaccented palatal vowel, and to prefix *a*, especially before *r* (this second tendency is found likewise in Southern Sardinian, etc.; see *Arch.*, ii. 138); *e.g.*, Sicil. *'nténniri*, Neap. *'ndénnere*, intendere; Sicil. *arricamári*, Neap. *arragamare*, ricamare (see *Arch.*, ii. 150).—In complete contrast to the tendency to get rid of double consonants which has been particularly noted in Venetian (C. 1), we here come to the great division of Italy where the tendency grows strong to gemination (or the doubling of consonants); and the Neapolitan in this respect goes farther than the Sicilian (*e.g.*, Sicil. *doppu*, dopo; *'nsemmula*, insieme, in-simul; Neap. *dellecato*, dilicato; *úmmeto*, umido; *débbole*).—As to the phonetic phenomena connected with the syntax (see B. 2), it is sufficient to cite such Sicilian examples as *nišuna ronna*, nesuna donna, alongside of *c' é donni*, c' è donne; *ćincu jorna*, cinque giorni, alongside of *chiú ghiorna*, più giorni: and the Neapolitan *la vocca*, la bocca, alongside of *a bocca a bocca*, ad buccam, etc.

We now proceed to the special consideration, first, of the Sicilian, and, secondly, of the dialects of the mainland.

a. Sicilian.—The Sicilian vocalism is conspicuously etymological. Though differing in color from the Tuscan, it is not less noble, and between the two there are remarkable points of contact. The dominant variety ignores the diphthongs of ĕ́ and of ŏ́, as it has been seen that they are ignored in Sardinia (B. 2), and here also the ĭ́ and the ŭ́ appear intact; but the ḗ and the ṓ are fittingly represented by *i* and *u*; and with equal symmetry unaccented *e* and *o* are reproduced by *i* and *u*. Examples: *téni*, tiene; *nóvu*, nuovo; *pilu*, pelo; *jugu*, giogo; *crídiri*, credere; *sira*, sera; *vina*, vena; *suli*, il sole; *ura*, ora. The *é* and *ó* of position are represented by *e* and *o* (*vermi*, verme; *nuvéḍḍu*, novello; *morti*, la morte; *cornu*), and thus normally they correspond to the open *e* and *o* of the Tuscan. And if in some cases the Sicilian appears to be exceptional (*stiḍḍa*, stella; *vínniri*, vendere; *furma*, etc.), it usually corresponds even in this with the Tuscan, where also we find the same apparent exception of the closed instead of the open vowel (*stẹlla*, *vẹndere*, *fọrma*, etc., *Arch.*, ii. 146)—In the evolution of the consonants it is enough to add here the change of *lj* into *ghj* (*e.g.*, *fígghiu*, figlio) and of *ll* into *ḍḍ* (*e.g.*, *gaḍḍu*, gallo).

b. Dialects of the Neapolitan Mainland.—The Calabrian (by which is to be understood more particularly the vernacular group of the two Further Calabrias) may be fairly considered as a continuation of the Sicilian type, as is seen from the following examples:—*cori*, cuore; *petra*, *fímmina*, femina; *vuci*, voce; *onuri*, onore; *figghiu*, figlio; *spaḍḍe*, spalle; *trizza*, treccia (here the *d* of the nexus *nd*, however, is not subject to the assimilation which is common to Sicilian and Neapolitan in general: *e.g.*, *quandu*, *ćangendu*, piangendo). Even the *h* for *š = fj*, as in *huri* (Sicil. *šuri*, fiore), which is characteristic in Calabrian, has its forerunners in the island (see *Arch.*, ii. 456). Along the coast of the extreme south of Italy, when once we have passed the interruptions caused by the Basilisco type (so called from the Basilicata), the Sicilian vocalism again presents itself in the Otrantine, especially in the seaboard of Capo di Leuca. In the Lecce variety of the Otrantine the vocalism which has just been described as Sicilian also keeps its ground in the main (*cf.* Morosi, *Arch.*, iv.): *sira*, sera; *leítu*, oliveto; *pilu*; *ura*, ora; *dulure.* Nay more, the Sicilian phenomenon of *lj* into *ghj* (*figghiu*, figlio, etc.) is well marked in Terra d'Otranto and also in Terra di Bari, and even extends through the Capitanata and the Basilicata (*cf.* D'Ovidio, *Arch.*, iv. 159–60). As strongly marked in the Terra d'Otranto is the insular phenomenon of *ll* into *ḍḍ* (*ḍr*), which is also very widely distributed through the Neapolitan territories on the eastern side of the Apennines, sending outshoots even to the Abruzzo. But in Terra d'Otranto we are already in the midst of the diphthongs of ĕ́ and of ŏ́, both non-positional and positional, the development or permanence of which is determined by the quality of the unaccented final vowel,—as generally happens in the dialects of the south. The diphthongal product of the ŏ́, and hence also of the *ó* of position, is here *ue*. The following are examples from the Lecce variety of the dialect: *core*, pl. *cueri*; *metu*, *mieti*, *mete*, mieto, mieti, miete (Lat. mĕtere); *sentu*, *sienti*, *sente*; *olu*, *uéli*, *ola*, volo, voli, vola; *mordu*, *muerdi*, *morde.* The *ue* recalls the fundamental reduction which belongs to the Gallic (not to speak of the Spanish) regions, and stretches through the Terra di Bari, where there are other diphthongs curiously suggestive of the Gallic: *e.g.*, at Bitonto alongside of *luechẹ*, luogo, *suẹnnẹ*, sonno, we have the *oi* and the *ai* from *ĭ* or *ẹ* of the previous phase (*vẹćoinẹ*, vicino), and the *au* from *o* of the previous phase (*anaurẹ*, onore), besides a diphthongal disturbance of the *á*. Here also occurs the change of *á* into an *e* more or less pure (thus, at Cisterninọ, *scunsulête*, sconsolata; at Canosa di Puglia, *arruête*, arrivata; *n-ghèpe*, "in capa," that is, in capo); to which may be added the continual weakening or elision of the unaccented vowels not only at the end but in the body of the word (thus, at Bitonto, *vẹndett*, *spranz*). A similar type meets us as we cross into Capitanata (Cerignola: *faćáivẹ*, facera; *afféisẹ* offese; *sfaziânne*, soddisfazione; *n'-ghêipẹ*, in capo; *'nzultêitẹ*, insultata; *arraǵǵètẹ*, arrabbiato); such forms being apparently the outposts of the Abruzzan, which, however, is only reached through the Molise—a district not very populous even now, and still more thinly peopled in bygone days—whose prevailing forms of speech in some measure interrupt the historical continuity of the dialects of the Adriatic versant, presenting, as it were, an irruption from the other side of the Apennines. In the head valley of the Molise, at Agnone, the legitimate precursors of the Abruzzan vernaculars reappear (*fatoica*, fatica; *perdoiva*, perdeva; *voirẹ*, vero; *paina*, pena; *sẹgneura; cheurẹ; šẹlleriẹtẹ*, scellerati, where, however, the disturbance of the *a* is only occasional, *i.e.*, is dependent on the *i* formerly heard in the end of the word; *cf. maltrattata, spẹrâva*, etc.). The following are pure Abruzzan examples. (1) From Bucchianico (Abruzzo Citeriore): *veivẹ*, vivo; *rrajẹ*, re; *allaure*, allora; *craune*, corona; *circhê*, cercare; *mêlẹ*, male; *grênnẹ*, grande; *quênne*, but *'nsultate*, insultata; *strade*, strada (where again it is seen that the reduction of the *á* depends on the quality of the final unaccented vowel, and that it is not produced exclusively by *i*, which would give rise to a further reduction: *scillarite*, scellerati; *ampire*, impári). (2) From Pratola Peligna (Abruzzo Ulteriore II.): *majẹ*, mia; *'naure*, onore; *'njuriéte*, inguriata; *desperéte*, disperata (alongside of *vennecá*, vendicare). It almost appears that a continuity with Emilian ought to be established across the Marches (where another irruption of greater "Italianity" has taken place: a third of more dubious origin has been indicated for Venice, C. 1); see *Arch.*, ii. 445. A negative characteristic for Abruzzan is the absence of *ć* = *pj* and of *š* = *fj*; and the reason seems evident. Here the *pj* and *fj* themselves appear to be modern or of recent reduction,—the ancient formulæ sometimes occurring intact (as in the Bergamasc for Upper Italy), *e.g.*, *plánje* and *pránge* alongside of *piánje*, pragnere.[1] To the south of the Abruzzi begins and in the Abruzzi grows prominent that contrast in regard to the formulæ *alt ald* (resolved in the Neapolitan and Sicilian into *aut*, etc., just as in the Piedmontese, etc.) by which the types *aldare*, altare, and *callẹ*, caldo, are reached.—For the rest, when the condition and connections of the vowel system still retained by so large a proportion of the dialects of the eastern versant of the Neapolitan Apennines, and the difference which exists in regard to the preservation of the unaccented vowels between the Ligurian and the Gallo-Italic forms of speech on the other versant of the northern Apennines, are considered, one cannot fail to see how much justice there is in the longitudinal or Apenninian partition of the Italian dialects indicated by Dante.—But, to continue, in the Basilicata, which drains into the Gulf of Taranto, and may be said to lie within the Apennines, not only is the elision of final unaccented vowels a prevailing characteristic; there are also frequent elisions of the unaccented vowels within the word. Thus at Matera: *sintenn la femn chessa cós*, sentendo la femina questa cosa; *disprât*, disperata; at Saponara di Grumento: *uomnn' scilrati*, uomini scellerati; *mnetta*, vendetta.—But even if we return to the Mediterranean versant and, leaving the Sicilian type of the Calabrias, retrace our steps till we pass into the Neapolitan pure and simple, we find that even in Naples the unaccented final vowels behave badly, the labial turning to *ẹ* (*biellẹ*, bello) and even the *a* (*bellă*) being greatly weakened. And here occurs a Palæo-Italic instance which is worth mention: while Latin was accustomed to drop the *u* of its nominative only in presence of *r* (*gener* from *gener-u-s, *vir* from *vir-u-s; *cf.* the Tuscan or Italian apocopated forms *véner* = vénere, *venner* = vennero, etc.), Oscan and Umbrian go much further: Oscan, hurz = *hort-u-s, Lat. hortus; Umbr. *pihaz*, piatus; *emps*, emptus, etc. In Umbrian inscriptions we find *u* alternating with the *a* of the nom. sing. fem. and plur. neut. In complete contrast with the Sicilian vocalism is the Neapolitan *e* for unaccented and particularly final *i* of the Latin and Neo-Latin or Italian phases (*e.g.*, *viene*, vieni; *cf. infra*), to say nothing further of the regular diphthongization, within certain limits, of accented *e* or *o* in position (*apiertẹ*, aperto, fem. *aperta; muortẹ*, morto, fem. *morta*, etc.).—Characteristic also of the Neapolitan are certain insertions of vowels to obviate certain collocations: hence *ódejo* for *odio*, or more curiously *ávotrẹ*, altro (*i.e.*, *aultro*, *autro*, as in Upper Italy, hence *áotro*, *av-ọ-tro*) or *cuóvẹtẹ*, colto (*i.e.*, *cuolto*, *cuóuto*, *cuóv-ọ-to*). In the quasi-morphological domain it is to be noted how the Siculo-Calabrian *u* for the ancient *ŏ́* and *ŭ́*, and the Siculo-Calabrian *i* for the ancient *ĕ́*, *ĭ́*, are also still found in the Neapolitan, and, in particular, that they alternate with *o* and *e* in a manner that is determined by the difference of termination. Thus *cosetore*, cucitore, pl. *coseture* (*i.e.*, *coseturi*, the *-i* passing into *e* in keeping with the Neapolitan characteristic already mentioned); *sposẹ*, sposo, pl. *spuse*; *noće*, noce, pl. *nuće*; *credẹ*, io credo; *cride* (*cridi), tu credi; *crede*, egli crede; *nigrẹ*, but *negra*.

Passing now to a cursory mention of purely morphological phenomena, we begin with that form which is referred to the Latin pluperfect (see A. 1, B. 2), but which here too performs the functions of the conditional. Examples from the living dialects of (1) Calabria Citeriore are *faceru*, farei (Castrovillari); *tu te la collerre*, tu te l'acolleresti (Cosenza); *l'aććettéra*, l'accetterebbe (Grimaldi); and from those of (2) the Abruzzi, *vulér'*, vorrei (Castelli); *dére*, darei (Atessa); *candére*, canterei. For the dialects of the Abruzzi, we can check our observations by examples from the oldest chronicle of Aquila, as *non habéra lassato*, non avrebbe lasciato (str. 180). There are some interesting remains (more or less corrupted both in form and usage) of ancient consonantal terminations which have not yet been sufficiently studied: *s' incaricaviti*, s' incaricava, -abat (Basilicata, Senise); *ebbiti*, ebbe (*ib.*); *aviadi*, aveva (Calabria, Grimaldi); *arrivaudi*, arrivò (*ib.*). The last example also gives the *-an* of the 3d pers. sing. perf. of the first conjugation, which still occurs in Sicily and between the horns of the Neapolitan mainland. In the Abruzzi (and in the Ascolan district) the 3d person of the plural is in process of disappearing (the *-no* having fallen away and the preceding vowel being obscured), and its function is assumed by the 3d person singular; *cf.* C. 1. The explanation of the Neapolitan forms *songhẹ* io sono, essi sono, *donghẹ*, io do, *stonghẹ*, io sto, as also of the enclitic of the 2d person plural which exists, *e.g.*, in the Sicil. *avíssivu*, Neap. *avístevẹ*, aveste, has been correctly given more than once. It may be remarked in conclusion that this Neo-Latin region keeps company with the Roumanian in maintaining in large use the *-ora* derived from the ancient neuter plurals of the type *tempora*: Sicil. *jócura*, giuochi; Calabr. *nídura*, Abruzz. *nídẹre*, nidi. As for literary documents, if mere fragments and dubious instances are left out of account, Sicilian poetry goes back as far as to the first half of the 13th century, to which century also the chronicles written in Sicilian extend; but either the copies which we possess are not contemporary or the paleographic key of the readings preserved to us is wanting. In the library of Naples, some MSS. of the 14th century contain poetical translations of which the dialect would seem to belong to the Mediterranean versant of the southern provinces. The old rhymed chronicle of Aquila, which has been referred to more than once above, belongs to the 14th century.

4. *Dialects of Umbria, the Marches, and the Province of Rome.*—The Ascolan dialect (basin of the Tronto) still depends on the Abruzzan system; and speaking generally, several conspicuous southern phenomena are widely distributed through the region now under review. Thus the *ll* = *ld* extends from the Abruzzi (Norcia: *callu*, caldo; Rome: *ariscalla*, riscalda; the phenomenon, however, occurs also in Corsica); and the assimilation of *nd* into *nn*, and of *mb* into *mm*, stretches through Umbria, the Marches, and Rome, and even crosses from the Roman provinces into southern Tuscany (Rieti: *quanno*, quando; Spoleto: *comannava*, comandava; Assisi: *piagnenno*, piangendo; Sanseverino Marches: *piagnenne*, *'mmece*, invece (imbece); Fabriano: *vennecasse*, vendicarsi; Osimo: *monno*, mondo; Rome: *fronna*, fronda; *piommo*, piombo; Pitigliano (Tuscany): *quanno*, *piagnenno*). Even the diphthongs of the *e* and the *o* in position are largely represented. Examples are—at Norcia: *tiempi*, *uocchi*, *stuortu*; Assisi and Fabriano: *tiempo*; Orvieto: *tiempo*, *tierra*, *le tuorte*, li torti, and even *duonna*. The change of *l* into *r*, so frequent throughout this region, and particularly characteristic of Rome, is a phenomenon common to the Aquilan dialect. Similar facts might be adduced in abundance. And it is to be noted that the features common to Umbro-Roman and the Neapolitan dialects must have been more numerous in the past, as this was the region where the Tuscan current met the southern, and by reason of its superior culture gradually gained the ascendency.[2]—The phonologi-

---

[1] So again even still *pleuve* and *prove*, piove, which suggests a fine Latinism of another sort still retained,—*nengue*, ninguere; so that in the most ancient chronicle of Aquila (str. 437) the reading *se ploveva o nengueva* is truly dialectical.

[2] There is therefore nothing surprising in the fact that, for example, the chronicle of Monaldeschi of Orvieto (14th century) should indicate a form of speech of which Muratori remarks: "Romanis tunc familiaris, nimirum quæ in nonnullis accedebat ad Neapolitanam seu vocibus seu pronuntiatione." The *alt* into

cal connections between the Northern Umbrian, the Aretine, and the Gallo-Italic type have already been indicated (B. 2). In what relates to morphology, the *-orno* of the 3d pers. plur. of the perfect of the first conjugation has been pointed out as an essential peculiarity of the Umbro-Roman territory; but even this it shares with the Aquila vernaculars, which, moreover, extend it to the other paradigms: *amórno, timórono*, etc. Further, this termination is found also in the Tuscan dialects.—In a large part of Umbria an *m* or *t* is prefixed to the sign of the dative: *t-a lu*, a lui; *m-al re*, al re;[1] which must be the remains of the auxiliary prepositions *int*(*us*), *a*(*m*)*pud*, *cf.* Prov. *amb*, *am* (*cf Arch.*, ii. 444–46).—By means of the series of Perugine texts this group of dialects may be traced back with confidence to the 13th century; and to this region should also belong a "Confession," half Latin half vernacular, dating from about the 11th century, edited and annotated by Flechia (*Arch.*, vii. 121 *sqq.*). The "chronicle" of Monaldeschi has been already mentioned. A collection of ancient dialectal texts of Perugia and the neighboring districts is to be published by Monaci in the *Archivio Glottologico*.

D. *Tuscan, and the literary language of the Italians.*—We have now only to deal with the Tuscan territory. It is bounded on the W. by the sea. To the north it terminates with the Apennines; for Romagna Toscana, the strip of country on the Adriatic versant which belongs to it administratively, is assigned to Emilia as regards dialect. In the north-west also the Emilian presses on the Tuscan, extending as it does down the Mediterranean slope of the Apennines in Lunigiana and Garfagnana. Intrusions which may be called Emilian have also been noted to the west of the Apennines in the district where the Arno and the Tiber take their rise (Aretine dialects); and it has been seen how thence to the sea the Umbrian and Roman dialects surround the Tuscan. Such are the narrow limits of the "promised land" of the language which has succeeded and was worthy to succeed Latin in the history of Italian culture and civilization,—the land which comprises Florence, Siena, Lucca, and Pisa.—The Tuscan type may be best described by the negative method. There do not exist in it, on the one hand, any of those phenomena by which the other dialectal types of Italy mainly differ from the Latin base (such as *ü*=*ǘ*; frequent elision of unaccented vowels; *ba*=*gua*; *š*=*fl*; *nn*=*nd*, etc.); nor, on the other hand, is there any series of alterations of the Latin base peculiar to the Tuscan. This twofold negative description may further serve for the Tuscan or literary Italian as contrasted with all the other Neo-Latin languages; indeed, even where the Tuscan has a tendency to alterations common to other types of the family, it shows itself more sober and self-denying,—as may be seen in the reduction of the *t* between vowels into *d* or of *c* (*k*) between vowels into *g*, which in Italian affects only a small part of the lexical series, while in Provençal or Spanish it may be said to pervade the whole (*e.g.*, Prov. and Span. *mudar*, Ital. *mutare*; Prov. *segur*, Span. *seguro*, Ital. *sicuro*). It may consequently be affirmed without any partiality that, in respect to historical nobility, the Italian not only holds the first rank among Neo-Latin languages, but almost constitutes an intermediate grade between the ancient or Latin and the modern or Romance.—What has just been said about the Tuscan, as compared with the other dialectal types of Italy, does not, however, preclude the fact that in the various Tuscan veins, and especially in the plebeian forms of speech, there occur particular instances of phonetic decay; but these must of necessity be ignored in so brief a sketch as the present. We shall confine ourselves to noting—what has a wide territorial diffusion—the reduction of *c* (*k*) between vowels to a mere breathing (*e.g.*, *fŭóho*, fuoco, but *porco*), or even its complete elision; the same phenomenon occurs also between word and word (*e.g.*, *la hasa*, but *in casa*), thus illustrating anew that syntactic class of phonetic alterations, either qualitative or quantitative, conspicuous in this region also, which has been already discussed for insular and southern Italy (B. 2; C. 2, 3), and could be exemplified for the Roman region as well (C. 4). As regards one or two individual phenomena, it must also be confessed that the Tuscan or literary Italian is not so well preserved as some other Neo-Latin tongues. Thus, French always keeps in the beginning of words the Latin formulæ *cl*, *pl*, *fl* (*clef*, *plaisir*, *fleur*, in contrast with the Italian *chiave*, *piacere*, *fiore*); but the Italian makes up for this by the greater vigor with which it is wont to resolve the same formula within the words, and by the greater symmetry thus produced between the two series (in opposition to the French *clef*, clave, we have, for example, the French *œil*, oclo; whereas, in the Italian, *chiave* and *occhio* correspond to each other). The Italian as well as the Roumanian has lost the ancient sibilant at the end (*-s* of the plurals, of the nominative singular, of the 2d persons, etc.) which throughout the rest of the Romance area has been preserved more or less tenaciously; and consequently it stands lower than old Provençal and old French, as far as true declension or, more precisely, the functional distinction between the forms of the *casus rectus* and the *casus obliquus* is concerned. But even in this respect the superiority of French and Provençal has proved merely transitory, and in their modern condition all the Neo-Latin forms of speech are generally surpassed by Italian even as regards the pure grammatical consistency of the noun. In conjugation Tuscan has lost that tense which for the sake of brevity we shall continue to call the pluperfect indicative; though it still survives outside of Italy and in other dialectal types of Italy itself (C. 3 *b*; *cf.* B. 2). It has also lost the *futurum exactum*, or perfect subjunctive, which is found in Spanish and Roumanian. But no one would on that account maintain that the Italian conjugation is less truly Latin than the Spanish, the Roumanian, or that of any other Neo-Latin language. It is, on the contrary, by far the most distinctively Latin as regards the tradition both of form and function, although many effects of the principle of analogy are to be observed, sometimes common to Italian with the other Neo-Latin languages, and sometimes peculiar to itself.

Those who find it hard to believe in the ethnological explanation of linguistic varieties ought to be convinced by any example so clear as that which Italy presents in the difference between the Tuscan or purely Italian type on the one side and the Gallo-Italic on the other. The names in this instance correspond exactly to the facts of the case. For the Gallo-Italic on either side of the Alps is evidently nothing else than a modification—varying in degree, but always very great—of the vulgar Latin, due to the reaction of the language or rather the oral tendencies of the Celts who succumbed to the Roman civilization. In other words, the case is one of new ethnic individualities arising from the fusion of two national entities, one of which, numerically more or less weak, is so far victorious that its speech is adopted, while the other succeeds in adapting that speech to its own habits of utterance. Genuine Italian, on the other hand, is not the result of the combination or conflict of the vulgar Latin with other tongues, but is the pure development of this alone. In other words, the case is that of an ancient national fusion in which vulgar Latin itself originated. Here that is native which in the other case was intrusive.—This greater purity of constitution gives the language a persistency which approaches permanent stability. There is no Old Italian to oppose to Modern Italian in the same sense as we have an Old French to oppose to a Modern French. It is true that in the old French writers, and even in the writers who used the dialects of Upper Italy, there was a tendency to bring back the popular forms to their ancient dignity; and it is true also that the Tuscan or literary Italian has suffered from the changes of centuries; but nevertheless it remains undoubted that in the former cases we have to deal with general transformations between old and new, while in the latter it is

---

ait, etc. (*aitro*, *moito*), which occur in the well known *Vita di Cola di Rienzo*, also shows Abruzzan affinity.

[1] This second prefix is common to the opposite valley of the Metauro, and appears farther south in the form of *me*,—Camerino: *me lu pettu*, nel petto, *me lu Seppurgru*, al Sepolcro.

evident that the language of Dante continues to be the Italian of modern speech and literature. This character of invariability has thus been in direct proportion to the purity of its Latin origin, while, on the contrary, where popular Latin has been adopted by peoples of foreign speech, the elaboration which it has undergone along the lines of their oral tendencies becomes always the greater the farther we get away from the point at which the Latin reached them,—in proportion, that is, to the time and space through which it has been transmitted in these foreign mouths.[1]

As for the primitive seat of the literary language of Italy, not only must it be regarded as confined within the limits of that narrower Tuscany already described; strictly speaking, it must be identified with the city of Florence alone. Leaving out of account, therefore, a small number of words borrowed from other Italian dialects, as a certain number have naturally been borrowed from foreign tongues, it may be said that all that was not Tuscan was eliminated from the literary form of speech. If we go back to the time of Dante we find, throughout almost all the dialects of the mainland with the exception of Tuscan, the change of vowels between singular and plural seen in *paese*, *paisi*; *quello*, *quilli*; *amore*, *amuri* (see B. 1; C. 3 *b*); but the literary language knows nothing at all of such a phenomenon, because it was unknown to the Tuscan region. But in Tuscan itself there were differences between Florentine and non-Florentine; in Florentine, *e.g.*, it was and is usual to say *dipignere* and *pugnere*, while the non-Florentine had it *dipegnere* and *pognere* (Lat. *pingere*, *pungere*). Now, it is precisely the Florentine forms which alone have currency in the literary language.

In the ancient compositions in the vulgar tongue, especially in poetry, non-Tuscan authors on the one hand accommodated their own dialect to the analogy of that which they felt to be the purest representative of the language of ancient Roman culture, while the Tuscan authors in their turn did not refuse to adopt the forms which had received the rights of citizenship from the literary celebrities of other parts of Italy. It was this state of matters which gave rise, in past times, to the numerous disputes about the true fatherland, and origin of the literary language of the Italians. But these have been deprived of all right to exist by the scientific investigation of the history of that language. If the older Italian poetry assumed or maintained forms alien to Tuscan speech, these forms were afterwards gradually eliminated, and the field was left to those which were purely Tuscan and indeed purely Florentine. And thus it remains absolutely true that, so far as phonetics, morphology, rudimental syntax, and in short the whole character and material of words and sentences are concerned, there is no literary language of Europe that is more thoroughly characterized by homogeneity and oneness, as if it had come forth in a single cast from the furnace, than the Italian.

But on the other hand it remains equally true that, so far as concerns the living confidence and uniformity in the use and style of the literary language—that is, of this Tuscan or Florentine material called to nourish the civilization and culture of all the Italians—the case is not a little altered, and the Italian nation appears to enjoy less fortunate conditions than other nations of Europe. Modern Italy had no glowing centre for the life of the whole nation into which and out of which the collective thought and language could be poured in ceaseless current for all and by all. Florence has not been Paris. Territorial contiguity and the little difference of the local dialect facilitated in the modern Rome the elevation of the language of conversation to a level with the literary language that came from Tuscany. A form of speech was thus produced which, though certainly destitute of the grace and the abundant flexibility of the Florentine, gives a good idea of what the dialect of a city becomes when it makes itself the language of a nation that is ripening its civilization in many and dissimilar centres. In such a case the dialect loses its slang and petty localisms, and at the same time also somewhat of its freshness; but it learns to express with more conscious sobriety and with more assured dignity the thought and the feeling of the various peoples which are fused in one national life. But what took place readily in Rome could not with equal ease happen in districts whose dialects were far removed from the Tuscan. In Piedmont, for example, or in Lombardy, the language of conversation did not correspond with the language of books, and the latter accordingly became artificial and labored. Poetry was least affected by these unfortunate conditions; for poetry may work well with a multiform language, where the need and the stimulus of the author's individuality assert themselves more strongly. But prose suffered immensely, and the Italians had good cause to envy the spontaneity and confidence of foreign literatures—of the French more particularly. In this reasonable envy lay the justification and the strength of the Manzoni school, which aimed at that absolute naturalness of the literary language, that absolute identity between the language of conversation and that of books, which the bulk of the Italians could reach and maintain only by naturalizing themselves in the living speech of modern Florence. The revolt of Manzoni against artificiality and mannerism in language and style was worthy of his genius, and has been largely fruitful. But the historical difference between the case of France (with the colloquial language of Paris) and that of Italy (with the colloquial language of Florence) implies more than one difficulty of principle; in the latter case there is sought to be produced by deliberate effort of the *literati* what in the former has been and remains the necessary and spontaneous product of the entire civilization. Manzoni's theories too easily lent themselves to deplorable exaggerations; men fell into a new artificiality, a manner of writing which might be called vulgar and almost slangy. The remedy for this must lie in the regulating power of the labor of the now regenerate Italian intellect,—a labor ever growing wider in its scope, more assiduous, and more thoroughly united.

Literature.—Fernow in the third volume of his *Römische Studien* (Zurich, 1806–8) gave a good survey of the dialects of Italy. The dawn of rigorously scientific methods had not then appeared; but Fernow's view is wide and genial. Similar praise is due to Biondelli's work *Sui dialetti gallo-italici* (Milan, 1853), which, however, is still ignorant of Diez. Fuchs, between Fernow and Biondelli, had made himself so far acquainted with the new methods; but his exploration (*Ueber die sogenannten unregelmässigen Zeitwörter in den Romanischen Sprachen, nebst Andeutungen über die wichtigsten romanischen Mundarten*, Berlin, 1840), though certainly of utility, was not very successful. Nor can the rapid survey of the Italian dialects given by Diez be ranked among the happiest portions of his great masterpiece. Among the followers of Diez who distinguished themselves in this department the first outside of Italy were certainly Mussafia, a cautious and clear continuator of the master, and the singularly acute Schuchardt. Next came the *Archivio glottologico italiano* (Rome, from 1873).—In historical study applied specially to the literary language Nannucci prepared the way with much sagacity and breadth of view; it is enough to mention his *Analisi critica dei verbi italiani* (Flor., 1844). Among the works of the disciples of the modern method may here be noted Canello, "Gli allótropi italiani" (*Arch.*, iii. 285–419) and Caix, *Origini della lingua poetica italiana* (Florence, 1880), which resolves itself into an accurate historical examination of the dialectal forms that occur in the old poetry.—For almost a quarter of a century a matchless investigator, Giovanni Flechia, has devoted assiduous, keen, and genial labor to the history and description both of the dialects and of the literary language (see *Arch.*, ii. 396, iii. 176).—Biondelli's book is of no small service also for the numerous translations which it contains of the Prodigal Son into Lombard, Piedmontese, and Emilian dialects. A dialogue translated into the vernaculars of all parts of Italy will be found in Zuccagni Orlandini's *Raccolta di dialetti italiani con illustrazioni etnologiche* (Florence, 1864). And every dialectal division is abundantly represented in a series of versions of a short novel of Boccaccio's, which Papanti has published under the title *I parlari italiani in Certaldo*, etc. (Leghorn, 1875). (G. I. A.)

---

[1] A complete analogy is afforded by the history of the Aryan or Sanskrit language in India, which in space and time shows always more and more strongly the reaction of the oral tendencies of the aboriginal races on whom it has been imposed. Thus the Pali presents the ancient Aryan organism in a condition analogous to that of the oldest French, and the Prakrit of the Dramas, on the other hand, in a condition like that of modern French.

PART IV.—LITERATURE.

Condition of Italy in the Middle Ages.

1. *Origins.*—There is one characteristic fact that distinguishes the Italy of the Middle Ages with regard to its intellectual conditions, and that is the tenacity with which the Latin tradition clung to life. At the end of the 5th century the Northern conquerors invaded Italy. The Roman world crumbled to pieces. A new kingdom arose at Ravenna under Theodoric, and their learning was not extinguished. The liberal arts flourished, the very Gothic kings surrounded themselves with masters of rhetoric and of grammar. The names of Cassiodorus, of Boetius, of Symmachus, are enough to show how Latin thought maintained its power amidst the political effacement of the Roman empire. And this thought held its ground throughout the subsequent ages and events. Thus, while elsewhere all culture had died out, there still remained in Italy some schools of laymen,[1] and some really extraordinary men were educated in them, such as Ennodius, a poet more pagan than Christian, Arator, Fortunatus, Venantius, Jovannicius, Felix the grammarian, Peter of Pisa, Paulinus of Aquileia, and many others, in all of whom we notice a contrast between the barbarous age they lived in and their aspiration towards a culture that should reunite them to the classical literature of Rome. The Italians never had much love for theological studies, and those who were addicted to them preferred Paris to Italy. It was something more practical, more positive, that had attraction for the Italians, and especially the study of Roman law. This zeal for the study of jurisprudence furthered the establishment of the mediæval universities of Bologna, Padua, Vicenza, Naples, Salerno, Modena, and Parma; and these, in their turn, helped to spread culture, and to prepare the ground in which the new vernacular literature was afterwards to be developed. The tenacity of classical traditions, the affection for the memories of Rome, the preoccupation with political interests, particularly shown in the wars of the Lombard communes against the empire of the Hohenstaufens, a spirit more naturally inclined to practice than to theory—all this had a powerful influence on the fate of Italian literature. Italy was wanting in that combination of conditions from which the spontaneous life of a people springs. This was chiefly owing to the fact that the history of the Italians never underwent interruption,—no foreign nation having come in to change them and make them young again. That childlike state of mind and heart which in other Latin races, as well as in the Germanic, was such a deep source of poetic inspiration, was almost utterly wanting in the Italians, who were always much drawn to history and very little to nature; so, while legends, tales, epic poems, satires were appearing and spreading on all sides, Italy was either quite a stranger to this movement, or took a peculiar part in it. We know, for example, what the Trojan traditions were in the Middle Ages; and we should have thought that in Italy—in the country of Rome, retaining the memory of Æneas and Virgil—they would have been specially developed, for it was from Virgil that the mediæval sympathy for the conquered of Troy was derived. In fact, however, it was not so. A strange book made its appearance in Europe, no one quite knows when, the *Historia de excidio Trojæ*, which purported to have been written by a certain Dares the Phrygian, an eyewitness of the Trojan war. In the Middle Ages this book was the basis of many literary labors. Benoît de Sainte-More composed an interminable French poem founded on it, which afterwards in its turn became a source for other poets to draw from, such as Herbort of Fritzlar and Conrad of Würzburg. Now for the curious phenomenon displayed by Italy. Whilst Benoît de Sainte-More wrote his poem in French, taking his material from a Latin history, whilst the two German writers, from a French source, made an almost original work in their own language,—an Italian, on the other hand, taking Benoît for his model, composed in Latin the *Historia destructionis Trojæ*; and this Italian was Guido delle Colonne of Messina, one of the vernacular poets of the Sicilian school, who must accordingly have known well how to use his own language. Guido was an imitator of the Provençals; he understood French, and yet wrote his own book in Latin, nay, changed the romance of the Troubadour into serious history. Much the same thing occurred with the other great legends. That of Alexander the Great gave rise to many French, German, and Spanish poems,—in Italy, only to the Latin distichs of Qualichino of Arezzo. The whole of Europe was full of the legend of Arthur. The Italians contented themselves with translating and with abridging the French romances, without adding anything of their own. The Italian writer could neither appropriate the legend nor color it with his own tints. Even religious legend, so widely spread in the Middle Ages, and springing up so naturally as it did from the heart of that society, only put out a few roots in Italy. Jacopo di Voragine, while collecting his lives of the Saints, remained only an historian, a man of learning, almost a critic who seemed doubtful about the things he related. Italy has none of those books in which the Middle Age, whether in its ascetic or its chivalrous character, is so strangely depicted. The intellectual life of Italy showed itself in an altogether special, positive, almost scientific form, in the study of Roman law, in the chronicles of Farfa, of Marsicano, and of many others, in translations from Aristotle, in the precepts of the school of Salerno, in the travels of Marco Polo,—in short, in a long series of facts which seem to detach themselves from the surroundings of the Middle Age, and to be united on the one side with classical Rome and on the other with the Renaissance.

Provençal and French preparatory periods.

The necessary consequence of all this was that the Latin language was most tenacious in Italy, and that the elaboration of the new vulgar tongue was very slow,—being in fact preceded by two periods of Italian literature in foreign languages. That is to say, there were many Italians who wrote Provençal poems, such as the Marchese Alberto Malaspina (12th century), Maestro Ferrari of Ferrara, Cigala of Genoa, Zorzi of Venice, Sordello of Mantua, Buvarello of Bologna, Nicoletto of Turin, and others who sang of love and of war, who haunted the courts, or lived in the midst of the people, accustoming them to new sounds and new harmonies. At the same time there was other poetry of an epic kind, written in a mixed language, of which French was the basis, but in which forms and words belonging to the Italian dialects were continually mingling. We find in it hybrid words exhibiting a treatment of sounds according to the rules of both languages,—French words with Italian terminations, a system of vocalization within the words approaching the Italo-Latin usage,—in short, something belonging at once to both tongues, as it were an attempt at interpenetration, at fusion. Such were the *Chanson de Geste*, *Macaire*, the *Entrée en Espagne* written by Niccola of Padua, the *Prise de Pampelune*, and some others. All this preceded the appearance of a purely Italian literature.

Attempts in dialect.

In the Franco-Italian poems there was, as it were, a clashing, a struggle between the two languages, the French, however, gaining the upper hand. This supremacy became gradually less and less. As the struggle continued between French and Italian, the former by degrees lost as much as the latter gained. The hybridism recurred, but it no longer predominated. In the *Bovo d' Antona* and the *Rainardo e Lesengrino* the Venetian dialect makes itself clearly felt, although the language is influenced by French forms. Thus these writings, which Ascoli has called "miste" (mixed), immediately preceded the appearance of purely Italian works.

---

Dialect poetry in Northern Italy.

It is now an established historical fact that there existed no writing in Italian before the 13th century. It was in the course of that century, and espcially from 1250 onwards, that the new literature largely unfolded and developed itself. This development was simultaneous in the whole peninsula, only there was a difference in the subject matter of the art. In the north, the poems of Giacomino of Verona and Bonvecino of Riva were specially religious, and were intended to be recited to the people. They were written in a dialect partaking of the Milanese and the Venetian; and in their style they strongly bore the mark of the influence of French narrative poetry. They may be considered as belonging to the popular kind of poetry, taking the word, however, in a broad sense. Perhaps this sort of composition was encouraged by the old custom in the north of Italy of listening in the piazzas and on the highways to the songs of the jongleurs. To the very same crowds who had been delighted with the stories of romance, and who had listened to the story of the wickedness of *Macaire* and the misfortunes of *Blanciflor*, another jongleur would sing of the terrors of the *Babilonia Infernale* and the blessedness of the *Gerusalemme celeste*, and the singers of religious poetry vied with those of the *Chansons de Geste*.

Love poetry in Southern Italy.

In the south of Italy, on the other hand, the love-song prevailed, of which we have an interesting specimen in the *Contrasto* attributed to Ciullo d'Alcamo, about which modern Italian critics have much exercised themselves. This "contrasto" (dispute) between a man and a woman in Sicilian dialect certainly must not be considered as the most ancient or as the only southern poem of a popular kind. It belongs without doubt to the time of the emperor Frederick II., and is important as a proof that there existed a popular poetry independent of literary poetry. The *Contrasto* of Ciullo d'Alcamo is the most remarkable relic of a kind of poetry that has perished or which perhaps was smothered by the ancient Sicilian literature. Its distinguishing point was its possessing all the opposite qualities to the poetry of the rhymers of what we shall call the Sicilian school. Vigorous in the expression of feeling, it seems to come from a real sentiment. The conceits, which are sometimes most bold and very coarse, show that it proceeded from the lowest grades of society. Everything is original in Ciullo's *Contrasto*. Conventionality has no place in it. It is marked by the sensuality characteristic of the people of the South.

Siculo-Provençal school.

The reverse of all this happened in the Siculo-Provençal school, at the head of which was Frederick II. Imitation was the fundamental characteristic of this school, to which belonged Enzio, king of Sardinia, Pier delle Vigne, Inghilfredi, Guido and Odo delle Colonne, Jacopo d'Aquino, Rugieri Pugliese, Giacomo da Lentino, Arrigo Testa, and others. These rhymers never moved a step beyond the ideas of chivalry; they had no originality; they did not sing what they felt in their heart; they abhorred the true and the real. They only aimed at copying as closely as they could the poetry of the Provençal troubadours.[1] The art of the Siculo-Provençal school was born decrepit, and there were many reasons for this,—first, because the chivalrous spirit, from which the poetry of the troubadours was derived, was now old and on its deathbed; next, because the Provençal art itself, which the Sicilians took as their model, was in its decadence. It may seem strange, but it is true, that when the emperor Frederick II., a philosopher, a statesman, a very original legislator, took to writing poetry, he could only copy and amuse himself with absolute puerilities. His art, like that of all the other poets of his court, was wholly conventional, mechanical, affected. It was completely wanting in what constitutes poetry,—ideality, feeling, sentiment, inspiration. The Italians have had great disputes among themselves about the original form of the poems of the Sicilian school, that is to say, whether they were written in Sicilian dialect, or in that language which Dante called "volgare, illustre, aulico, cortigiano;" and the question is not yet settled. But now the critics of most authority hold that the primitive form of these poems was the Sicilian dialect, modified for literary purposes with the help of Provençal and Latin; the theory of the "lingua illustre" has been almost entirely rejected, since we cannot say on what rules it could have been founded, when literature was in its infancy, trying its feet, and lisping its first words. The Sicilian certainly, in accordance with a tendency common to all dialects, in passing from the spoken to the written form, must have gained in dignity; but this was not enough to create the so-called "lingua illustre," which was upheld by Perticari and others on grounds rather political than literary.

Religious lyric poetry in Umbria.

In the 13th century a mighty religious movement took place in Italy, of which the rise of the two great orders of Saint Francis and Saint Dominic was at once the cause and the effect. Around Francis of Assisi a legend has grown up in which naturally the imaginative element prevails. Yet from some points in it we seem to be able to infer that its hero had a strong feeling for nature, and a heart open to the most lively impressions. Many poems are attributed to him. The legend relates that in the eighteenth year of his penance, when almost wrapt in ecstasy, he dictated the *Cantico del Sole.* Even if this hymn be really his, it cannot be considered as a poetical work, being written in a kind of prose simply marked by assonances. As for the other poems, which for a long time were believed to be by Saint Francis, their spuriousness is now generally recognized. The true poet who represented in all its strength and breadth the religious feeling that had made special progress in Umbria was Jacopo dei Benedetti of Todi, known as Jacopone. The story is that sorrow at the sudden death of his wife had disordered his mind, and that, having sold all he possessed and given it to the poor, he covered himself with rags, and took pleasure in being laughed at, and followed by a crowd of people who mocked him and called after him "Jacopone, Jacopone." We do not know whether this be true. What we do know is that a vehement passion must have stirred his heart and maintained a despotic hold over him, the passion of divine love. Under its influence Jacopone went on raving for years and years, subjecting himself to the severest sufferings, and giving vent to his religious intoxication in his poems. There is no art in him, there is not the slightest indication of deliberate effort; there is only feeling, a feeling that absorbed him, fascinated him, penetrated him through and through. His poetry was all inside him, and burst out, not so much in words as in sighs, in groans, in cries that often seem really to come from a monomaniac. But Jacopone was a mystic, who from his hermit's cell looked out into the world and specially watched the papacy, scourging with his words Celestine V. and Boniface VIII. He was put in prison and laden with chains, but his spirit lifted itself up to God, and that was enough for him. The same feeling that prompted him to pour out in song ecstasies of divine love, and to despise and trample on himself, moved him to reprove those who forsook the heavenly road, whether they were popes, prelates, or monks. In Jacopone there was a strong originality, and in the period of the origins of Italian literature he was one of the most characteristic writers.

---

The religious drama.

The religious movement in Umbria was followed by another literary phenomenon, that of the religious drama. In 1258 an old hermit, Raniero Fasani, leaving the cavern in which he had lived for many years, suddenly appeared at Perugia. These were very sad times for Italy. The quarrels in the cities, the factions of the Ghibellines and the Guelphs, the interdicts and excommunications issued by the popes, the reprisals of the imperial party, the cruelty and tyranny of the nobles, the plagues and famines, kept the people in constant agitation, and spread abroad mysterious fears. The commotion was increased in Perugia by Fasani, who represented himself as sent by God to disclose mysterious visions, and to announce to the world terrible visitations. Under the influence of fear there were formed "Compagnie di Disciplinanti," who, for a penance, scourged themselves till they drew blood, and sang "Laudi" in dialogue in their confraternities. These "Laudi," closely connected with the liturgy, were the first example of the drama in the vulgar tongue of Italy. They were written in the Umbrian dialect, in verses of eight syllables, and of course they have not any artistic value. Their development, however, was rapid. As early as the end of the same 13th century we have the *Devozioni del Giovedì e Venerdì Santo*, which have some dramatic elements in them, though they are still connected with the liturgical office. Then we have the representation *di un Monaco che andò al servizio di Dio* ("of a monk who entered the service of God"), in which there is already an approach to the definite form which this kind of literary work assumed in the following centuries.

Tuscan poetry.

In the 13th century Tuscany was peculiarly circumstanced both as regards its literary condition and its political life. The Tuscans spoke a dialect which most closely resembled the mother-tongue, Latin,—one which afterwards became almost exclusively the language of literature, and which was already regarded at the end of the 13th century as surpassing the others; "Lingua Tusca magis apta est ad literam sive literaturam;" thus writes Antonio da Tempo of Padua, born about 1275. Being very little or not at all affected by the Germanic invasion, Tuscany was never subjected to the feudal system. It had fierce internal struggles, but they did not weaken its life; on the contrary, they rather gave it fresh vigor and strengthened it, and (especially after the final fall of the Hohenstaufens at the battle of Benevento in 1266) made it the first province of Italy. From 1266 onwards Florence was in a position to begin that movement of political reform which in 1282 resulted in the appointment of the Priori delle Arti, and the establishment of the Arti Minori. This was afterwards copied by Siena with the Magistrato dei Nove, by Lucca, by Pistoia, and by other Guelph cities in Tuscany with similar popular institutions. In this way the guilds had taken the government into their hands, and it was a time of both social and political prosperity. It was no wonder that literature also rose to an unlooked-for height. In Tuscany, too, there was some popular love poetry; there was a school of imitators of the Sicilians, their chief being Dante of Majano; but its literary originality took another line—that of humorous and satirical poetry. The entirely democratic form of government created a style of poetry which stood in the strongest antithesis to the mediæval mystic and chivalrous style. Devout invocation of God or of a lady came from the cloister and the castle; in the streets of the cities everything that had gone before was treated with ridicule or biting sarcasm. Folgore of San Gimignano laughs when in his sonnets he tells a party of Sienese youths what are the occupations of every month in the year, or when he teaches a party of Florentine lads the pleasures of every day in the week. Cene della Chitarra laughs when he parodies Folgore's sonnets. The sonnets of Rustico di Filippo are half fun and half satire; laughing and crying, joking and satire, are all to be found in Cecco Angiolieri of Siena, the oldest "humorist" we know, a far-off precursor of Rabelais, of Montaigne, of Jean Paul Richter, of Sydney Smith. But another kind of poetry also began in Tuscany. Guittone d'Arezzo made art quite chivalrous for national motives, Provençal forms for Latin. He attempted political poetry, and, although his work is full of the strangest obscurities, he prepared the way for the Bolognese school. In the 13th century Bologna was the city of science, and philosophical poetry appeared there. Guido Guinicelli was the poet after the new fashion of the art. In him the ideas of chivalry are changed and enlarged; he sings of love and together with it of the nobility of the mind. The reigning thought in Guinicelli's *Canzoni* is nothing external to his own subjectivity. His speculative mind, accustomed to wandering in the field of philosophy, transfuses its lucubrations into his art. Guinicelli's poetry has some of the faults of the school of Guittone d'Arezzo; he reasons too much; he is wanting in imagination; his poetry is a product of the intellect rather than of the fancy and the heart. Nevertheless he marks a great development in the history of Italian art, especially because of his close connection with Dante's lyric poetry.

Allegorical poetry.

But before we come to Dante, certain other facts, not, however, unconnected with his history, must be noticed. In the 13th century there were several poems in the allegorical style. One of these is by Brunetto Latini, who, it is well known, was attached by ties of strong affection to Alighieri. His *Tesoretto* is a short poem, in seven-syllable verses, rhyming in couplets, in which the author professes to be lost in a wilderness and to meet with a lady, who is Nature, from whom he receives much instruction. We see here the vision, the allegory, the instruction with a moral object,—three elements which we shall find again in the *Divina Commedia*. Francesco da Barberino, a learned lawyer who was secretary to bishops, a judge, a notary, wrote two little allegorical poems,—the *Documenti d'Amore* and *Del Reggimento e dei Costumi delle Donne*. Like the *Tesoretto*, these poems are of no value as works of art, but are, on the other hand, of importance in the history of manners. A fourth allegorical work was the *Intelligenza*, by some attributed to Dino Compagni, but probably not his, and only a version of French poems.

Prose in 13th century.

While the production of Italian poetry in the 13th century was abundant and varied, that of prose was scanty. The oldest specimen dates from 1231, and consists of short notices of entries and expenses by Mattasalà di Spinello dei Lambertini of Siena. In 1253 and 1260 there are some commercial letters of other Sienese. But there is no sign of literary prose. Before we come to any, we meet with a phenomenon like that we noticed in regard to poetry. Here again we find a period of Italian literature in French. Halfway on in the century a certain Aldobrando or Aldobrandino (it is not known whether he was of Florence or of Siena) wrote a book for Beatrice of Savoy, countess of Provence, called *Le Régime du Corps*. In 1267 Martino da Canale wrote in the same "langue d'oïl" a chronicle of Venice. Rusticiano of Pisa, who was for a long while at the court of Edward I. of England, composed many chivalrous romances, derived from the Arthurian cycle, and subsequently wrote the travels of Marco Polo, which may perhaps have been dictated by the great traveller himself. And finally Brunetto Latini wrote his *Tesoro* in French.

Next in order to the original compositions in the langue d'oïl come the translations or adaptations from the same. There are some moral narratives taken from religious legends; a romance of Julius Cæsar;

some short histories of ancient knights; the *Tavola Rotonda;* translations of the *Viaggi* of Marco Polo and of the *Tesoro* of Latini. At the same time there appeared translations from Latin of moral and ascetic works, of histories, and of treatises on rhetoric and oratory. Up to the very recent times it was still possible to reckon as the most ancient works in Italian prose the *Cronaca* of Matteo Spinello da Giovenazzo, and the *Cronaca* of Ricordano Malespini. But now both of them have been shown to be forgeries of a much later time. Therefore the oldest prose writing is a scientific book—the *Composizione del Mondo* by Ristoro d'Arezzo, who lived about the middle of the 13th century. This work is a copious treatise on astronomy and geography. Ristoro was superior to the other writers of the time on these subjects, because he seems to have been a careful observer of natural phenomena, and consequently many of the things he relates were the result of his personal investigations. There is also another short treatise, *De Regimine Rectoris*, by Fra Paolino, a Minorite friar of Venice, who was probably bishop of Pozzuoli, and who also wrote a Latin chronicle. His treatise stands in close relation to that of Egidio Colonna, *De Regimine Principum.* It is written in the Venetian dialect.

The 13th century was very rich in tales. There is a collection called the *Cento Novelle Antiche* which contains stories drawn from Oriental, Greek, and Trojan traditions, from ancient and mediæval history, from the legends of Brittany, Provence, and Italy, and from the Bible, from the local tradition of Italy as well as from histories of animals and old mythology. This book has a distant resemblance to the Spanish collection known as *El Conde Lucanor.* The peculiarity of the Italian book is that the stories are very short, and that they seem to be mere outlines to be filled in by the narrator as he goes along. Other prose novels were inserted by Francesco Barberino in his work *Del Reggimento e dei Costumi delle Donne*, but they are of much less importance than the others. On the whole the Italian novels of the 13th century have little originality, and are only a faint reflection of the very rich legendary literature of France. Some attention should be paid to the *Lettere* of Fra Guittone d'Arezzo, who wrote many poems and also some letters in prose, the subjects of which are moral and religious. Love of antiquity, of the traditions of Rome and of its language, was so strong in Guittone that he tried to write Italian in a Latin style, and it turned out obscure, involved, and altogether barbarous. He took as his special model Seneca, and hence his prose assumed a bombastic style, which, according to his views, was very artistic, but which in fact was alien to the true spirit of art, and resulted in the extravagant and grotesque.

New Tuscan school of lyric poetry.

2. *The Spontaneous Development of Italian Literature.*—In the year 1282, the year in which the new Florentine constitution of the "Arti Minori" was completed, a period of literature began that does not belong to the age of first beginnings, but to that of development. With the school of Lapo Gianni, of Guido Cavalcanti, of Cino da Pistoia, and Dante Alighieri, lyric poetry became exclusively Tuscan. The whole novelty and poetic power of this school, which really was the beginning of Italian art, consist in what Dante expresses so happily—

> "Quando
> Amore spira, noto, ed a quel modo
> Ch'ei detta dentro, vo significando—"

that is to say, in a power of expressing the feelings of the soul in the way in which love inspires them, in an appropriate and graceful manner, fitting form to matter, and by art fusing one with the other. The Tuscan lyric poetry, the first true Italian art, is pre-eminent in this artistic fusion, in the spontaneous and at the same time deliberate action of the mind. In Lapo Gianni the new style is not free from some admixture of the old associations of the Siculo-Provençal school. He wavered as it were between two manners. The empty and involved phraseology of the Sicilians is absent, but the poet does not always rid himself of their influence. Sometimes, however, he draws freely from his own heart, and then the subtleties and obscurities disappear, and his verse becomes clear, flowing, and elegant.

Guido Cavalcanti

Guido Cavalcanti was a learned man with a high conception of his art. He felt the value of it, and adapted his learning to it. Cavalcanti was already a good deal out of sympathy with the mediæval spirit; he reflected deeply on his own work, and from this reflection he derived his poetical conception. His poems may be divided into two classes,—those which portray the philosopher, "il sottilissimo dialettico," as Lorenzo the Magnificent called him, and those which are more directly the product of his poetic nature imbued with mysticism and metaphysics. To the first set belongs the famous poem *Sulla Natura d'Amore*, which in fact is a treatise on amorous metaphysics, and was annotated later in a learned way by the most renowned Platonic philosophers of the 15th century, such as Marsilius Ficinus and others. In other poems of Cavalcanti's besides this, we see a tendency to subtilize and to stifle the poetic imagery under a dead weight of philosophy. But there are many of his sonnets in which the truth of the images and the elegance and simplicity of the style are admirable, and make us feel that we are in quite a new period of art. This is particularly felt in Cavalcanti's *Ballate*, for in them he pours himself out ingenuously and without affectation, but with an invariable and profound consciousness of his art. Far above all the others for the reality of the sorrow and the love displayed, for the melancholy longing expressed for the distant home, for the calm and solemn yearning of his heart for the lady of his love, for a deep subjectivity which is never troubled by metaphysical subtleties, is the ballata composed by Cavalcanti when he was banished from Florence with the party of the Bianchi in 1300, and took refuge at Sarzana.

Cino da Pistoia.

The third poet among the followers of the new school was Cino da Pistoia, of the family of the Sinibuldi (see CINO DA PISTOIA). His love poems are so sweet, so mellow, and so musical that they are only surpassed by Dante. The pains of love are described by him with vigorous touches; it is easy to see that they are not feigned but real. The psychology of love and of sorrow nearly reaches perfection.

Dante.

As the author of the *Vita Nuova*, Dante also belongs to the same lyric school. This is a little book of poetry and prose, which tells the story of his love for Beatrice, who is pretty generally held to be the daughter of Folco Portinari. In the lyrics of the *Vita Nuova* (so called by its author to indicate that his first meeting with Beatrice was the beginning for him of a life entirely different from that he had hitherto led) there is a high idealization of love. It seems as if there were in it nothing earthly or human, and that the poet had his eyes constantly fixed on heaven while singing of his lady. Everything is supersensual, aerial, heavenly, and the real Beatrice is always gradually melting more and more into the symbolical one—passing out of her human nature and into the divine. The life of Dante covered a period of fifty-six years (1265–1321). In 1289 he fought at Campaldino against the Ghibellines of Arezzo. In 1300 he was probably one of the ambassadors from the Guelphs to Pope Boniface VIII. He was afterwards elected a prior, and it is believed that he took part in the measure for banishing the heads of the factions of the Bianchi and Neri which began that same year in Florence. The Neri betook themselves to Boniface, accusing their adversaries of an understanding with the Ghibellines. For the purpose of meeting these accusations Dante went to Boniface, but in the meanwhile the latter sent Charles of Valois as a peacemaker, with secret injunctions to crush the Bianchi. Charles fulfilled this part of his mission with zeal. One of the proscribed was Dante, on the charge of illicit gains and of extortion during his priorate. Henceforth the poet's life was a perpetual pilgrimage from one Italian town to another. He was also at Paris in 1308. He hoped great things from the descent of Henry VII. of Luxembourg into Italy, and wrote to the people and princes to announce the coming of the day of redemption. He had hopes, too, of Uguccione della Faggiuola, leader of the Pisans against Florence (1315). But all his hopes proved vain, and he took refuge with Can Grande della Scala at Verona (1316), moving on later to Busone di Raffaelli at Gubbio (1318), to Vagano della Torre at Udine (1319), and to Guido Novello da Polenta at Ravenna (1320), where he died the next year.

It appears that Dante began the *Convito* in his youth, that he continued it in his exile, and never completed it. He named the book the *Convito*, to signify that a banquet of wisdom was served up in it. He meant to comment on fourteen of his songs, and the commentary was to be the promised serving up of the banquet. But he only composed four out of the fourteen treatises. As has been said by one of Dante's chief admirers in modern Italy, "it is a book of much learning, but the symbolism kills the poetry, and the quotations stifle the real knowledge." The *Convito* is very valuable as giving a notion of the mind of Dante and of his scholastic education. On the other hand, his treatise *De Monarchia* shows us his political conception. It was probably written in 1310, when the coming of Henry VII. revived such hopes in him. He meant to prove in it that a universal monarchy is necessary to the well-being of the world, that the Roman people had a right to claim the exercise of this office, that the authority of a monarch comes straight from God and not from his vicar, the pope. The *De Monarchia* is written in scholastic Latin, and the treatment is scholastic. Another work of Dante's, also written in Latin, is the *De Vulgari Eloquio*. It seems that it was to have consisted of four books, but only two were written. His work is a defence of the "volgare illustre" (the noble vulgar tongue) against the Italian dialects. Modern criticism regards it as very superficial.[1]

The work which made Dante immortal, and raised him above all the other men of genius in Italy, was his *Divina Commedia*. The author himself called it a "comedy," as he says in his letter to Can Grande della Scala, for two reasons,—because it has, like comedies, a sad beginning and a cheerful ending, and because it is written in a "middle" style, treating alike of lofty and of lowly things. Alighieri is the protagonist of the great drama. He represents himself as lost in a forest, in a night at the end of March and in the first days of April, 1300, when he was thirty-five years old. At first he is much alarmed, but afterwards he is cheered when, at dawn, he finds himself at the foot of a hill. He wishes to ascend it, but three wild beasts prevent his doing so,—a panther, a lion, and a she-wolf. When he flees back in haste to the forest, Virgil appears to him, and tells him that he is sent by Beatrice, at the command of the "Gentle Lady" (Mary) and of St. Lucy. He tells him that, in order to escape from the she-wolf, he must go through hell and purgatory with him, and afterwards Beatrice herself will lead him up to heaven. Dante's Inferno takes the shape of a deep valley, reaching down in constantly narrowing circles from the surface of our hemisphere, in the midst of which stands the mount of Jerusalem, to the centre of the earth. This valley, or inverted cone, is cut by nine circles, where the souls of the damned are tortured; they are divided into three principal classes, viz., the incontinent, the violent, and the fraudulent. The valley is shut in at its entrance by the river Acheron, and afterwards crossed by the Stygian marsh, and the rivers Phlegethon and Cocytus. The two poets pass through the ninth part of each circle, talking to some of the shades they meet, and at last they come to Lucifer, stationed in the centre of the earth. "Grappling at his hair," they pass the centre of gravity, and begin to ascend a narrow way which brings them to the other hemisphere. They reach a little island, whence rises a very high mountain, which is purgatory. It also is divided into nine circles: in the first two are the souls of those who deferred their repentance till the hour of death; in the others the shades are cleansing themselves from the seven deadly sins. Cato of Utica guards this place. The two poets ascend the mountain, going always to the right hand. On the summit they find the earthly paradise, which is the exact antipodes to the mountain of Jerusalem. Here appear a long train of venerable persons, who precede a chariot drawn by griffins. Beatrice makes her appearance, and with her Dante takes his flight through the nine heavens, where he sees the souls of the blest according to the order of their desert. At the tenth heaven, the Empyrean, he sees them again all together, arranged in the shape of a gleaming rose round a most dazzling centre, which is God. Here the poet contemplates the mysteries of the Trinity and of the manhood of Christ. Then the vision comes to an end.

An allegorical meaning is hidden under the literal one of the *Commedia*. Dante, travelling through the invisible worlds, is a symbol of mankind aiming at the double object of temporal and eternal happiness. By the forest in which the poet loses himself is meant the civil and religious confusion of society, deprived of its two guides, the emperor and the pope. The mountain illuminated by the sun is universal monarchy. The three beasts are the three vices and the three powers which offered the greatest obstacles to Dante's designs: envy is Florence, light, fickle, and divided by the Bianchi and Neri; pride is the house of France; avarice is the papal court; Virgil represents reason and the empire. Beatrice is the symbol of the supernatural aid without which man cannot attain the supreme end, which is God.

But the merit of the poem does not lie in the allegory, which still connects it with mediæval literature. What is new in it is the individual art of the poet, the classic art transfused for the first time into a Romance form. Dante is above all a great artist. Whether he describes nature, analyzes passions, curses the vices, or sings hymns to the virtues, he is always wonderful for the grandeur and delicacy of his art. Out of the rude mediæval vision he has made the greatest work of art of modern times. He took the materials for his poem from theology, from philosophy, from history, from mythology,—but more especially from his own passions, from hatred and love; and he has breathed the breath of genius into all these materials. Under the pen of the poet, the dead come to life again: they become men again, and speak the language of their time, of their passions. Farinata degli Uberti, Boniface VIII., Count Ugolino, Manfred, Sordello, Hugh Capet, St. Thomas Aquinas, Cacciaguida, St. Benedict, St. Peter, are all so many objective creations; they stand before us in all the life of their characters, their feelings, their habits.

Yet this world of fancy in which the poet moves is not only made living by the power of his genius, but it is changed by his consciousness. The real chastiser of the sins, the rewarder of the virtues, is Dante himself. The personal interest which he brings to bear on the historical representation of the three worlds is what most interests us and stirs us. Dante remakes history after his own passions. Thus the *Divina Commedia* can fairly be called, not only the most lifelike drama of the thoughts and feelings that moved men at that time, but also the most clear and spontaneous reflection of the individual feelings of the poet, from the indignation of the citizen and the exile to the faith of the believer and the ardor of the philosopher. The *Divina Commedia* fixed and clearly defined the destiny of Italian literature, to give artistic lustre, and hence immortality, to all the forms of literature which the Middle Ages had produced. Dante begins the great era of the Renaissance.

[1] See "Sul Trattato de Vulgari Eloquentia," in the *Saggi Critici*, by Francesco d'Ovidio, Naples, 1879.

Petrarch. Two facts characterize the literary life of Petrarch (1304–1374), classical research and the new human feeling introduced into his lyric poetry. Nor are these two facts separate; rather is the one the result of the other. The Petrarch who travelled about unearthing the works of the great Latin writers helps us to understand the Petrarch who, having completely detached himself from the Middle Ages, loved a real lady with a human love, and celebrated her in her life and after her death in poems full of studied elegance. Petrarch was the first humanist, and he was at the same time the first lyric poet of the modern school. His career was long and tempestuous. He lived for many years at Avignon, cursing the corruption of the papal court; he travelled through nearly the whole of Europe; he corresponded with emperors and popes; he was considered the first man of letters of his time; he had honors and riches; and he always bore about within him discontent, melancholy, and incapacity for satisfaction,—three characteristics of the modern man.

He wrote many Latin works, the most important of which are the *Epistolæ* and the poem entitled *Africa*. He was the first to have a style of his own, and to attempt to revive the art of the Latin authors. He specially studied Cicero, and endeavored to copy him. Perhaps there was a sort of affinity between their characters. The *Epistolæ* are of very great importance for the study of Petrarch's life and mind, as well as for the history of his times. *Africa* is a long poem in hexameters on the campaigns of Scipio, which in places shows the gleam of genius. In the *Itinerarium Syriacum*, and in another work that is now lost,[1] Petrarch appears as the first geographer of modern times.

It is not very certain who was the lady loved by Petrarch. There are some reasons for believing that she was called Laura De Noves, and was the wife of Ugo de Sade, but this is very far from being proved. It appears anyhow that the lady lived at Avignon.

The *Canzoniere* is divided into three parts,—the first containing the poems written during Laura's lifetime, the second the poems written after her death, the third the *Trionfi*. The one and only subject of these poems is love; but the treatment is full of variety in conception, in imagery, and in sentiment, derived from the most varied impressions of nature. Petrarch's love is real and deep, and to this is due the merit of his lyric verse, which is quite different, not only from that of the Provençal troubadours and of the Italian poets before him, but also from the lyrics of Dante. Petrarch is a psychological poet, who dives down into his own soul, examines all his feelings, and knows how to render them with an art of exquisite sweetness. The lyrics of Petrarch are no longer transcendental like Dante's, but on the contrary keep entirely within human limits. In struggles, in doubts, in fears, in disappointments, in griefs, in joys, in fact in everything, the poet finds material for his poetry. The second part of the *Canzoniere* is the more passionate. The *Trionfi* are inferior; it is clear that in them Petrarch tried to imitate the *Divina Commedia*, but never came near it.

The *Canzoniere* includes also a few political poems, —a canzone to Italy, one supposed to be addressed to Cola di Rienzi, and several sonnets against the court of Avignon. These are remarkable for their vigor of feeling, and also for showing that Petrarch had formed the idea of *Italianità* better even than Alighieri. The Italy which he wooed was different from any conceived by the men of the Middle Ages, and in this also he was a precursor of modern times and of modern aspirations. Petrarch had no decided political idea. He exalted Cola di Rienzi, invoked the emperor Charles IV., praised the Visconti; in fact his politics were affected more by impressions than by principles; but above all this reigned constantly the love of Italy, his ancient and glorious country, which in his mind is reunited with Rome, the great city of his heroes Cicero and Scipio.

Boccaccio. Boccaccio (1313–1375) had the same enthusiastic love of antiquity and the same worship for the new Italian literature as Petrarch. He was the first, with the help of a Greek born in Calabria, to put together a Latin translation of the *Iliad* and the *Odyssey*. His vast classical learning was shown specially in the work *De Genealogia Deorum*, in which he enumerates the gods according to genealogical trees constructed on the authority of the various authors who wrote about the pagan divinities. This work marked an era in studies preparatory to the revival of classical learning. And at the same time it opened the way for the modern criticism, because Boccaccio in his researches and in his own judgment was always independent of the authors whom he most esteemed. The *Genealogia Deorum* is, as Heeren said, an encyclopædia of mythological knowledge; and it was the precursor of the great humanistic movement which was developed in the 15th century. Boccaccio was also the first historian of women in his *De Claris Mulieribus*, and the first to undertake to tell the story of the great unfortunate in his *De Casibus Virorum Illustrium*. He continued and perfected former geographical investigations in his interesting book *De Montibus, Silvis, Fontibus, Lacubus, Fluminibus, Stagnis, et Paludibus, et de Nominibus Maris*, for which he made use of Vibius Sequester, but which contains also many new and valuable observations. He also wrote in Latin several eclogues, some letters, and other minor compositions. Of his Italian works his lyrics do not come anywhere near to the perfection of Petrarch's. His sonnets, mostly about love, are quite mediocre. His narrative poetry is better. Although now he can no longer claim the distinction long conceded to him of having invented the octave stanza (which afterwards became the metre of the poems of Boiardo, of Ariosto, and of Tasso), yet he was certainly the first to use it in a work of some length and written with artistic skill, such as is his *Teseide*. This is a poem in twelve books, and the subject is the love of two Theban youths, Arcita and Palemone, for Emilia, one of the Amazons. We find in it great luxury of description, inflated speeches, much erudition, but little poetry. However, the *Teseide* is the oldest Italian romantic poem. The *Filostrato* relates the loves of Troiolo and Griseida (Troilus and Cressida). It may be that Boccaccio knew the French poem of the Trojan war by Benoît de Sainte-More; but the interest of the Italian work lies in the analysis of the passion of love, which is treated with a masterly hand. The *Ninfale Fiesolano* tells the love story of the nymph Mesola and the shepherd Africo. The *Amorosa Visione*, a poem in triplets, doubtless owed its origin to the *Divina Commedia*. The *Ameto* is a mixture of prose and poetry, and is the first Italian pastoral romance.

The *Filocopo* takes the earliest place among prose romances. In it Boccaccio tells in a laborious style, and in the most prolix way, the loves of Florio and Biancafiore. Probably for this work he drew materials from a popular source or from a Byzantine romance, which Leonzio Pilato may have mentioned to him. In the *Filocopo* there is a remarkable exuberance in the mythological part, which damages the romance as an artistic work, but which contributes to the history of Boccaccio's mind. The *Fiammetta* is another romance, about the loves of Boccaccio and Maria d'Aquino, a supposed natural daughter of King Robert, whom he always called by this name of Fiammetta.

The Italian work which principally made Boccaccio famous was the *Decamerone*, a collection of a hundred novels, related by a party of men and women, who had retired to a villa near Florence to escape from the plague in 1348. Novel-writing, so abundant in the preceding century, especially in France, now for the first time assumed an artistic shape. The style of Boccaccio tends to the imitation of Latin, but in him prose first took the form of elaborated art. The rudeness of the old *fabliaux* gives place to the careful and conscientious work of a mind that has a feeling for what is beautiful, that has studied the classic authors, and that strives to imitate them as much as possible. Over and above this, in the *Decamerone*, Boccaccio is a delineator of character and an observer of passions. In this lies his novelty. Much has been written about the sources of the novels of the *Decamerone*. Probably Boccaccio made use both of written and of oral sources. Popular tradition must have furnished him with the materials of many stories, as, for example, that of Griselda.

---

[1] See Hortis, *Studi sulle Opere Latine del Boccaccio*, Trieste, 1879, pp. 235, 236.

Unlike Petrarch, who was always discontented, preoccupied, wearied with life, disturbed by disappointments, we find Boccaccio calm, serene, satisfied with himself and with his surroundings. Notwithstanding these fundamental differences in their characters, the two great authors were old and warm friends. But their affection for Dante was not equal. Petrarch, who says that he saw him once in his childhood, did not preserve a pleasant recollection of him, and it would be useless to deny that he was jealous of his renown. The *Divina Commedia* was sent him by Boccaccio, when he was an old man, and he confessed that he never read it. On the other hand, Boccaccio felt for Dante something more than love—enthusiasm. He wrote a biography of him, of which the accuracy is now unfairly depreciated by some critics, and he gave public critical lectures on the poem in Santa Maria del Fiore at Florence.

Fazio degli Uberti and Federigo Frezzi were imitators of the *Divina Commedia*, but only in its external form. The former wrote the *Dittamondo*, a long poem, in which the author supposes that he was taken by the geographer Solinus into different parts of the world, and that his guide related the history of them. The legends of the rise of the different Italian cities have some importance historically. Frezzi, bishop of his native town Foligno, wrote the *Quadriregio*, a poem of the four kingdoms—Love, Satan, the Vices, and the Virtues. This poem has many points of resemblance with the *Divina Commedia*. Frezzi pictures the condition of man who rises from a state of vice to one of virtue, and describes hell, the limbo, purgatory, and heaven. The poet has Pallas for a companion.

Minor novelists.

Ser Giovanni Fiorentino wrote, under the title of *Pecorone*, a collection of tales, which are supposed to have been related by a monk and a nun in the parlor of a monastery of Forlì. He closely imitated Boccaccio, and drew on Villani's chronicle for his historical stories. Franco Sacchetti wrote tales too, for the most part on subjects taken from Florentine history. His book gives a life-like picture of Florentine society at the end of the 14th century. The subjects are almost always improper; but it is evident that Sacchetti collected all these anecdotes in order to draw from them his own conclusions and moral reflections, which are to be found at the end of every story. From this point of view Sacchetti's work comes near to the *Moralisationes* of the Middle Ages. A third novelist was Giovanni Sercambi of Lucca, who after 1374 wrote a book, in imitation of Boccaccio, about a party of people who were supposed to fly from a plague and to go travelling about in different Italian cities, stopping here and there telling stories.

The chroniclers.

It has already been said that the chronicles formerly believed to have been of the 13th century are now regarded as forgeries of later times. At the end of the 13th century, however, we find a chronicle by Dino Compagni, which, notwithstanding the unfavorable opinion of it entertained especially by some German writers, is in all probability authentic. Little is known about the life of Compagni. Noble by birth, he was democratic in feeling, and was a supporter of the new ordinances of Giano della Bella. As prior and gonfalonier of justice he always had the public welfare at heart. When Charles of Valois, the nominee of Boniface VIII., was expected in Florence, Compagni, foreseeing the evils of civil discord, assembled a number of citizens in the church of San Giovanni, and tried to quiet their excited spirits. His chronicle relates the events that came under his own notice from 1280 to 1312. It bears the stamp of a strong subjectivity. The narrative is constantly personal. It often rises to the finest dramatic style. A strong patriotic feeling and an exalted desire for what is right pervade the book. Compagni is more an historian than a chronicler, because he looks for the reasons of events, and makes profound reflections on them. According to our judgment he is one of the most important authorities for that period of Florentine history, notwithstanding the not insignificant mistakes in fact which are to be found in his writings. On the contrary, Giovanni Villani, born in 1300, was more of a chronicler than an historian. He relates the events up to 1347. The journeys that he made in Italy and France, and the information thus acquired, account for the fact that his chronicle, called by him *Istorie Fiorentine*, comprises events that occurred all over Europe. What specially distinguishes the work of Villani is that he speaks at length, not only of events in politics and war, but also of the stipends of public officials, of the sums of money used for paying soldiers and for public festivals, and of many other things of which the knowledge is very valuable. With such an abundance of information it is not to be wondered at that Villani's narrative is often encumbered with fables and errors, particularly when he speaks of things that happened before his own time. Matteo was the brother of Giovanni Villani, and continued the chronicle up to 1363. It was again continued by Filippo Villani. Gino Capponi, author of the *Commentari dell' Acquisto di Pisa* and of the narration of the *Tumulto dei Ciompi*, belonged to both the 14th and the 15th centuries.

Ascetic writers.

The *Divina Commedia* is ascetic in its conception, and in a good many points of its execution. To a large extent similar is the genius of Petrarch; yet neither Petrarch nor Dante could be classified among the pure ascetics of their time. But many other writers come under this head. St. Catherine of Siena's mysticism was political. She was a really extraordinary woman, who aspired to bring back the Church of Rome to evangelical virtue, and who has left a collection of letters written in a high and lofty tone to all kinds of people, including popes. She joins hands on the one side with Jacopone of Todi, on the other with Savonarola. Hers is the strongest, clearest, most exalted religious utterance that made itself heard in Italy in the 14th century. It is not to be thought that precise ideas of reformation entered into her head, but the want of a great moral reform was felt in her heart. And she spoke indeed *ex abundantia cordis*. Anyhow the daughter of Jacopo Benincasa must take her place among those whom from afar off prepared the way for the religious movement which took effect, especially in Germany and England, in the 16th century.

Another Sienese, Giovanni Colombini, founder of the order of Jesuati, preached poverty by precept and example, going back to the religious idea of St. Francis of Assisi. His letters are among the most remarkable in the category of ascetic works in the 14th century. Passavanti, in his *Specchio della vera Penitenza*, attached instruction to narrative. Cavalca translated from the Latin the *Vite dei Santi Padri*. Rivalta left behind him many sermons, and Franco Sacchetti (the famous novelist) many discourses. On the whole, there is no doubt that one of the most important productions of the Italian spirit of the 14th century was the religious literature.

Comic poetry.

In direct antithesis with this is a kind of literature which has a strong popular element. Humorous poetry, the poetry of laughter and jest, which as we saw was largely developed in the 13th century, was carried on in the 14th by Bindo Bonichi, Arrigo di Castruccio, Cecco Nuccoli, Andrea Orgagna, Filippo de' Bardi, Adriano de' Rossi, Antonio Pucci, and other lesser writers. Orgagna was specially comic; Bonichi was comic with a satirical and moral purpose. Antonio Pucci was superior to all of them for the variety of his production. He put into triplets the chronicle of Giovanni Villani (*Centiloquio*), and wrote many historical poems called *Serventesi*, many comic poems, and not a few epico-popular compositions on various subjects. A little poem of his in seven cantos treats of the war between the Florentines and the Pisans from 1362 to 1365. Other poems drawn from a legendary source celebrate the *Reina d'Oriente*, *Apollonio di Tiro*, the *Bel Gherardino*, etc. These poems, meant to be recited to the people, are the remote ancestors of the romantic epic, which was developed in the 16th century, and the first representatives of which were Boiardo and Ariosto.

Political and amatory poetry.

Many poets of the 14th century have left us political works. Of these Fazio degli Uberti, the author of *Dittamondo*, who wrote a *Serventese* to the lords and people of Italy, a poem on Rome, a fierce invective against Charles IV. of Luxemburg, deserves notice, and Francesco di Vannozzo, Frate Stoppa, and Matteo Frescobaldi. It may be said in general that following the example of Petrarch many writers devoted themselves to patriotic poetry. From this period also dates that literary phenomenon known under the name of Petrarchism. The Petrarchists, or those who sang of love, imitating Petrarch's manner, were found already in the 14th century. But others treated the same subject with more originality, in a manner that might be called semi-popular. Such were the *Ballate* of Ser Giovanni Fiorentino, of Franco Sacchetti, of Niccolo Soldanieri, of Guido and Bindo Donati. Ballate were poems sung to dancing, and we have very many songs for music of the 14th century.

Histories in verse.

We have already stated that Antonio Pucci versified Villani's *Chronicle*. This instance of versified history is not unique, and it is evidently connected with the precisely similar phenomenon offered by the "vulgar Latin" literature. It is enough to notice a chronicle of Arezzo in terza rima by Gorello de' Sinigardi, and the history, also in terza rima, of the journey of Pope Alexander III. to Venice by Pier de' Natali. Besides this, every kind of subject, whether history, tragedy, or husbandry, was treated in verse. Neri di Landocio wrote a life of St. Catherine; Jacopo Gradenigo put the gospels into triplets; Paganino Bonafede in the *Tesoro dei Rustici* gave many precepts in agriculture, beginning that kind of Georgic poetry which was fully developed later by Alamanni in his *Coltivazione*, by Girolamo Baruffaldi in the *Canapajo*, by Rucellai in the *Api*, by Bartolommeo Lorenzi in the *Coltivazione dei Monti*, by Giambattista Spolverini in the *Coltivazione del Riso*, etc.

Drama.

There cannot have have been an entire absence of dramatic literature in Italy in the 14th century, but traces of it are wanting, although we find them again in great abundance in the 15th century. The 14th century had, however, one drama unique of its kind. In the sixty years (1250 to 1310) which ran from the death of the emperor Frederick II. to the expedition of Henry VII., no emperor had come into Italy. In the north of Italy, Ezzelino da Romano, with the title of imperial vicar, had taken possession of almost the whole of the March of Treviso, and threatened Lombardy. The popes proclaimed a crusade against him, and, crushed by it, the Ezzelini fell. Padua then began to breathe again, and took to extending its dominion. There was living at Padua Albertino Mussato, born in 1261, a year after the catastrophe of the Ezzelini; he grew up among the survivors of a generation that hated the name of the tyrant. After having written in Latin a history of Henry VII., he devoted himself to a dramatic work on Ezzelino, and wrote it also in Latin. The *Eccerinus*, which was probably never represented on the stage, has been by some critics compared to the great tragic works of Greece. It would probably be nearer the truth to say that it has nothing in common with the works of Æschylus; but certainly the dramatic strength, the delineation of certain situations, and the narration of certain events are very original. Mussato's work stands alone in the history of Italian dramatic literature. Perhaps this would not have been the case if he had written it in Italian.

In the last years of the 14th century we find the struggle that was soon to break out between the indigenous literary tradition and the reviving classicism already alive in spirit. As representatives of this struggle, of this antagonism, we may consider Luigi Marsilio and Coluccio Salutati, both learned men who spoke and wrote Latin, who aspired to be humanists, but who meanwhile also loved Dante, Petrarch, and Boccaccio, and felt and celebrated in their writings the beauty of Italian literature.

Græco-Latin learning.

3. *The Renaissance*.—A great intellectual movement, which had been gathering for a long time, made itself felt in Italy in the 15th century. A number of men arose, all learned, laborious, indefatigable, and all intent on one great work. Such were Niccolò Niccoli, Giannozzo Manetti, Palla Strozzi, Leonardo Bruni, Francesco Filelfo, Poggio Bracciolini, Carlo d'Arezzo, Lorenzo Valla. Manetti buried himself in his books, slept only for a few hours in the night, never went out of doors, and spent his time in translating from Greek, studying Hebrew, and commenting on Aristotle. Palla Strozzi sent into Greece at his own expense to search for ancient books, and had Plutarch and Plato brought for him. Poggio Bracciolini went to the council of Constance, and found in a monastery in the dust-hole Cicero's *Orations*. He copied Quintilian with his own hand, discovered Lucretius, Plautus, Pliny, and many other Latin authors. Guarino went through the East in search of codices. Giovanni Aurispa returned to Venice with many hundreds of manuscripts. What was the passion that excited all these men? What did they search after? What did they look to? These Italians were but handing on the solemn tradition which, although partly latent, was the informing principle of Italian mediæval history, and now at length came out triumphant. This tradition was that same tenacious and sacred memory of Rome, that same worship of its language and institutions, which at one time had retarded the development of Italian literature, and now grafted the old Latin branch of ancient classicism on the flourishing stock of Italian literature. All this is but the continuation of a phenomenon that has existed for ages. It is the thought of Rome that always dominates Italians, the thought that keeps appearing from Boetius to Dante Alighieri, from Arnold of Brescia to Cola di Rienzi, which gathers strength with Petrarch and Boccaccio, and finally becomes triumphant in literature and life,—in life, because the modern spirit is fed on the works of the ancients. Men come to have a more just idea of nature: the world is no longer cursed or despised; truth and beauty join hands; man is born again; and human reason resumes its rights. Everything, the individual and society, are changed under the influence of new facts.

New social conditions.

First of all there was formed a human individuality, which was wanting in the Middle Ages. As Burckhardt has said, the man was changed into the individual. He began to feel and assert his own personality, which was constantly attaining a fuller realization. As a consequence of this, the idea of fame and the desire for it arose.

A really cultured class was formed, in the modern meaning of the word, and the conception was arrived at (completely unknown in former times) that the worth of a man did not depend at all on his birth but on his personal qualities. Poggio in his dialogue *De Nobilitate* declares that he entirely agreed with his interlocutors Niccolò Niccoli and Lorenzo de' Medici in the opinion that there is no other nobility but that of personal merit. External life was growing more refined in all particulars; the man of society was created; rules for civilized life were made; there was an increasing desire for sumptuous and artistic entertainments. The mediæval idea of existence was turned upside down: men who had hitherto turned their thoughts exclusively to heavenly things, and believed exclusively in the divine right, now began to think of beautifying their earthly existence, of making it happy and gay, and returned to a belief in their human rights. This was a great advance, but one which carried with it the seeds of many dangers. The conception of morality became gradually weaker. The "fay ce que vouldras" of Rabelais became the first principle of life. Religious feeling was blunted, was weakened, was changed, became pagan again. Finally the Italian of the Renaissance, in his qualities and his passions, became the most remarkable representative of the heights and depths, of the virtues and faults, of humanity. Corruption was associated with all that is most ideal in life; a profound scepticism took hold of people's minds; indifference to good and evil reached its highest point.

Literary dangers of Latinism.

Besides this, a great literary danger was hanging over Italy. Humanism threatened to submerge its youthful national literature. There were authors who laboriously tried to give Italian Latin forms, to do again, after Dante's time, what Guittone d'Arezzo had so unhappily done in the 13th century. Provincial dialects tried to reassert themselves in literature. The great authors of the 14th century, Dante, Petrarch, Boccaccio, were by many people forgotten or despised.

Influence of Florence.

It was Florence that saved literature by reconciling the classical models to modern feeling, Florence that succeeded in assimilating classical forms to the "vulgar" art. Still gathering vigor and elegance from classicism, still drawing from the ancient fountains all that they could supply of good and useful, it was able to preserve its real life, to keep its national traditions, and to guide literature along the way that had been opened to it by the writers of the preceding century. At Florence the most celebrated humanists wrote also in the vulgar tongue, and commented on Dante and Petrarch, and defended them from their enemies. Leon Battista Alberti, the learned Greek and Latin scholar, wrote in the vernacular, and Vespasiano da Bisticci, whilst he was constantly absorbed in Greek and Latin manuscripts, wrote the *Vite di Uomini Illustri*, valuable for their historical contents, and rivalling the best works of the 14th century in their candor and simplicity. Andrea da Barberino wrote the beautiful prose of the *Reali di Francia*, giving a coloring of "romanità" to the chivalrous romances. Belcari and Benivieni carry us back to the mystic idealism of earlier times.

Lorenzo de' Medici.

But it is in Lorenzo de' Medici that the influence of Florence on the Renaissance is particularly seen. In forming an opinion of him many people are led away by political preconceptions. Even as a statesman, Lorenzo has a conspicuous place in the history of his time, and in our day it will not be deemed reasonable to expect that in the age of lordships and principalities he alone should stand out from his time, and not feel the influence of the general condition of Italy. With this, however, we have nothing to do. We have to consider Lorenzo de' Medici as a man of letters; and as such he is one about whom tradition and reality best agree. His mind was formed by the ancients: he attended the class of the Greek Argyropulos, sat at Platonic banquets, took pains to collect codices, sculptures, vases, pictures, gems, and drawings to ornament the gardens of San Marco and to form the library afterwards called by his name. In the saloons of his Florentine palace, in his villas at Careggi, Fiesole, and Ambra, stood the wonderful chests painted by Dello with stories from Ovid, the Hercules of Pollajuolo, the Pallas of Botticelli, the works of Filippino and Verocchio. Lorenzo de' Medici lived entirely in the classical world; and yet if we read his poems we only see the man of his time, the admirer of Dante and of the old Tuscan poets, who takes inspiration from the popular muse, and who succeeds in giving to his poetry the colors of the most pronounced realism, as well as of the loftiest idealism, —who passes from the Platonic sonnet to the impassioned triplets of the *Amori di Venere*, from the grandiosity of the *Salve* to *Nencia* and to *Beoni*, from the *Canto Carnascialesco* to the *Lauda*. The feeling of nature is strong in him,—at one time sweet and melancholy, at another vigorous and deep, as if an echo of the feelings, the sorrows, the ambitions of that deeply agitated life. He liked to look into his own heart with a severe eye, but he was also able to pour himself out with tumultuous fulness. He described with the art of a sculptor; he satirized, laughed, prayed, sighed, always elegant, always a Florentine, but a Florentine who read Anacreon, Ovid, and Tibullus, who wished to enjoy life, but also to taste of the refinements of art.

Poliziano.

Next to Lorenzo comes Poliziano, who also united, and with greater art, the ancient and the modern, the popular and the classical style. In his *Rispetti* and in his *Ballate* the freshness of imagery and the plasticity of form are inimitable. He, a great Greek scholar, wrote Italian verses with dazzling colors; the purest elegance of the Greek sources pervaded his art in all its varieties, in the *Orfeo* as well as the *Stanze per la Giostra*.

The academies.

As a consequence of the intellectual movement towards the Renaissance, there arose in Italy in the 15th century three academies, those of Florence, of Naples, and of Rome. The Florentine academy was founded by Cosmo I. de' Medici. Having heard the praises of Platonic philosophy sung by Gemistus Pletho, who in 1439 was at the council of Florence, he took such a liking for those opinions that he soon made a plan for a literary congress which was especially to discuss them. Marsilius Ficinus has described the occupations and the entertainments of these academicians. Here, he said, the young men learnt, by way of pastime, precepts of conduct and the practice of eloquence; here grown-up men studied the government of the republic and the family; here the aged consoled themselves with the belief in a future world. The academy was divided into three classes:—that of patrons, who were members of the Medici family; that of hearers, among whom sat the most famous men of that age, such as Pico della Mirandola, Angelo Poliziano, Leon Battista Alberti; that of disciples, who were youths anxious to distinguish themselves in philosophical pursuits. It is known that the Platonic academy endeavored to promote, with regard to art, a second and a more exalted revival of antiquity. The Roman academy was founded by Giulio Pomponio Leto, with the object of promoting the discovery and the investigation of ancient monuments and books. It was a sort of religion of classicism, mixed with learning and philosophy. Platina, the celebrated author of the lives of the first hundred popes, belonged to it. At Naples, the academy known as the Pontaniana was instituted. The founder of it was Antonio Beccadelli, surnamed Il Panormita, and after his death the head was Il Pontano, who gave his name to it, and whose mind animated it.

Romantic poetry.

Romantic poems were the product of the moral scepticism and the artistic taste of the 15th century. Italy never had any true epic poetry in its period of literary birth. Still less could it have any in the Renaissance. It had, however, many poems called *Cantári*, because they contained stories that were sung to the people; and besides there were romantic poems, such as the *Buovo d'Antona*, the *Regina Ancroja*, and others. But the first to introduce elegance and a new life into this style was Luigi Pulci, who grew up in the house of the Medici, and who wrote the *Morgante Maggiore* at the request of Lucrezia Tornabuoni, mother of Lorenzo the Magnificent. The material of the *Morgante* is almost completely taken from an obscure chivalrous poem of the 15th century recently discovered by Professor Pio Rajna. On this foundation Pulci erected a structure of his own, often turning the subject into ridicule, burlesquing the characters, introducing many digressions, now capricious, now scientific, now theological. Pulci's merit consists in having been the first to raise the romantic epic which had been for two centuries in the hands of story-tellers into a work of art, and in having united the serious and the comic, thus happily depicting the manners and feelings of the time. With a more serious intention Matteo Boiardo, count of Scandiano, wrote his *Orlando innamorato*, in which he seems to have aspired to embrace the whole range of Carlovingian legends; but he did not complete his task. We find here too a large vein of humor and burlesque. Still the Ferrarese poet is drawn to the world of romance by a profound sympathy for chivalrous manners and feelings,—that is to say, for love, courtesy, valor, and generosity. A third romantic poem of the 15th century was the *Mambriano* by Francesco Bello (Cieco of Ferrara). He drew from the Carlovingian cycle, from the romances of the Round Table, from classical antiquity. He was a poet of no common genius, and of ready imagination. He showed the influence of Boiardo, especially in something of the fantastic which he introduced into his work.

Drama.

The development of the drama in the 15th century was very great. This kind of semi-popular literature was born in Florence, and attached itself to certain popular festivities that were usually held in honor of St. John the Baptist, patron saint of the city. The *Sacra Rappresentazione* is in substance nothing more than the development of the mediæval *Mistero* ("mystery-play"). Although it belonged to popular poetry, some of its authors were literary men of much renown. It is enough to notice Lorenzo de' Medici, who wrote *San Giovanni e Paolo*, and Feo Belcari, author of the *San Panunzio*, the *Abramo ed Isac*, etc. From the 15th century some element of the comic-profane found its way into the *Sacra Rappresentazione*. From its Biblical and legendary conventionalism Poliziano emancipated himself in his *Orfeo*, which, although in its exterior form belonged to the sacred representations, yet substantially detaches itself from them in its contents and in the artistic element introduced.

Pastoral poetry.

From Petrarch onwards the eclogue was a kind of literature that much pleased the Italians. In it, however, the pastoral element is only apparent, for there is nothing really rural in it. Such is the *Arcadia* of Jacopo Sannazzaro of Naples, author of a wearisome Latin poem *De Partu Virginis*, and of some piscatorial eclogues. The *Arcadia* is divided into ten eclogues, in which the festivities, the games, the sacrifices, the manners of a colony of shepherds are described. They are written in elegant verses, but it would be vain to look in them for the remotest feeling of country life. On the other hand, even in this style, Lorenzo de' Medici was superior. His *Nencia da Barberino*, as a modern writer says, is as it were the new and clear reproduction of the popular songs of the environs of Florence, melted into one majestic wave of octave stanzas. Lorenzo threw himself into the spirit of the bare realism of country life. There is a marked contrast between this work and the conventional bucolic of Sannazzaro and other writers. A rival of the Medici in this style, but always inferior to him, was Luigi Pulci in his *Beca da Dicomano*.

Lyric poetry.

The lyric love poetry of this century was unimportant. In its stead we see a completely new style arise, the *Canto Carnascialesco*. These were a kind of choral songs, which were accompanied with symbolical masquerades, common in Florence at the carnival. They were written in a metre like that of the ballate; and for the most part they were put into the mouth of a party of workmen and tradesmen, who, with not very chaste allusions, sang the praises of their art. These triumphs and masquerades were directed by Lorenzo himself. At eventide there set out into the city large companies on horseback, playing and singing these songs. There are some by Lorenzo himself, which surpass all the others in their mastery of art. That entitled *Bacco ed Arianna* is the most famous.

Religious reaction. Savonarola.

Girolamo Savonarola arose to fight against the literary and social movement of the Renaissance. He was a Ferrarese friar, born in 1452, and he came to Florence in 1489. Some have tried to make out that Savonarola was an apostle of liberty, others that he was a precursor of the Reformation. In truth, however, he was neither the one nor the other. In his struggle with Lorenzo de' Medici, he directed his attack against the promoter of classical studies, the patron of pagan literature, rather than against the political tyrant. Animated by mystic zeal, he took the line of a prophet, preaching against reading voluptuous authors, against the tyranny of the Medici, and calling for popular government. This, however, was not done from a desire for civil liberty, but because Savonarola saw in Lorenzo and his court the greatest obstacle to that return to Catholic doctrine which was his heart's desire; while he thought this return would be easily accomplished if, on the fall of the Medici, the Florentine republic should come into the hands of his supporters. There may be more justice in looking on Savonarola as the forerunner of the Reformation. If he was so, it was more than he intended. The friar of Ferrara never thought of attacking the papal dogma, and always maintained that he wished to remain within the church of Rome. He had none of the great aspirations of Luther. He only repeated the complaints and the exhortations of St. Catherine of Siena; he desired a reform of manners, entirely of manners, not of doctrine. He prepared the ground for the German and English religious movement of the 16th century, but unconsciously. In the history of Italian civilization he represents retrogression, that is to say, the cancelling of the great fact of the Renaissance, and return to mediæval ideas. His attempt to put himself in opposition to his time, to arrest the course of events, to bring the people back to the faith of the past, the belief that all the social evils came from a Medici and a Borgia, his not seeing the historical reality as it was, his aspiring to found a republic with Jesus Christ for its king,—all these things show that Savonarola was more of a fanatic than a thinker. Nor has he any great merit as a writer. He wrote Italian sermons, hymns (laudi), ascetic and political treatises, but they are roughly executed, and only important as throwing light on the history of his ideas. The religious poems of Girolamo Benivieni are better than his, and are drawn from the same inspirations. In these lyrics, sometimes sweet, always warm with religious feeling, Benivieni and with him Feo Belcari carry us back to the literature of the 14th century.

Histories, etc.

History had neither many nor very good students in the 15th century. Its revival belonged to the following age. It was mostly written in Latin. Leonardo Bruni of Arezzo wrote the history of Florence, Gioviano Pontano that of Naples, in Latin. Bernardino Corio wrote the history of Milan in Italian, but in a rude way.

Leonardo da Vinci wrote a treatise on painting, Leon Battista Alberti one on sculpture and architecture. But the names of these two men are important, not so much as authors of these treatises, but as being embodiments of another characteristic of the age of the Renaissance,—versatility of genius, power of application along many and varied lines, and of being excellent in all. Leonardo was an architect, a poet, a painter, an hydraulic engineer, and a distinguished mathematician. Alberti was a musician, studied jurisprudence, was an architect and a draughtsman, and had great fame in literature. He had a deep feeling for nature, an almost unique faculty of assimilating all that he saw and heard. Leonardo and Alberti are representatives and almost a compendium in themselves of all that intellectual vigor of the Renaissance age, which in the 16th century took to developing itself in its individual parts, making way for what has by some been called the golden age of Italian literature.

Development of the Renaissance.

4. *Development of the Renaissance.*—The fundamental characteristic of the literary epoch following that of the Renaissance is that it perfected itself in every kind of art, in particular uniting the essentially Italian character of its language with classicism of style. This period lasted from about 1494 to about 1560; and, strange to say, this very period of greater fruitfulness and literary greatness began from the year 1494, which with Charles VIII.'s descent into Italy marked the beginning of its political decadence and of foreign domination over it. But this is not hard to explain. All the most famous men of the first half of the 16th had been educated in the preceding century. Pietro Pomponazzo was born in 1462, Marcello Virgilio Adriani in 1464, Castiglione in 1468, Machiavelli in 1469, Bembo in 1470, Michelangelo Buonarroti and Ariosto in 1474, Nardi in 1476, Trissino in 1478, Guicciardini in 1482. Thus it is easy to understand how the literary activity which showed itself from the end of the 15th century to the middle of the following one was the product of the political and social conditions of the age in which these minds were formed, not of that in which their powers were displayed.

History.

Niccolò Machiavelli and Francesco Guicciardini were the chief originators of the science of history. Machiavelli's principal works are the *Istorie Fiorentine*, the *Discorsi sulla prima Deca di Tito Livio*, the *Arte della Guerra*, and the *Principe*. His merit consists in having been the creator of the experimental science of politics,—in having observed facts, studied histories, and drawn consequences from them. His history is sometimes inexact in facts; it is rather a political than an historical work. The peculiarity of Machiavelli's genius lay, as has been said, in his artistic feeling for the treatment and discussion of politics in and for themselves, without regard to an immediate end,—in his power of abstracting himself from the partial appearances of the transitory present, in order more thoroughly to possess himself of the eternal and inborn kingdom, and to bring it into subjection to himself. His *Principe* has been the subject of the severest accusations. But now, especially since Macaulay's essay, it is clear to every one that this book was only the result of the civil and moral conditions of Italy as it still is the faithful portrait of them.[1]

Next to Machiavelli, both as an historian and a statesman, comes Francesco Guicciardini. He taught law for many years at Florence; then, having devoted himself to politics, he was always in the service of the Medici. Leo X. made him governor of Modena, Reggio, and Parma. Clement VII. gave him the appointment of president of the Romagna, and afterwards that of lieutenant-general of the army against Charles V., and finally that of governor of Bologna. He worked for the return of the Medici to Florence, defending Duke Alexander from the accusations of the exiles and supporting the election of Cosmo I. Guicciardini was very observant, and endeavored to reduce his observations to a science. His *Storia d' Italia*, which extends from the death of Lorenzo de' Medici to 1534, is full of political wisdom, is skilfully arranged in its parts, gives a lively picture of the character of the persons it treats of, and is written in a grand style. He shows a profound knowledge of the human heart, and depicts with truth the temperaments, the capabilities, and the habits of the different European nations. Going back to the causes of events, he looked for the explanation of the divergent interests of princes and of their reciprocal jealousies. The fact of his having witnessed many of the events he related, and having taken part in them, adds authority to his words. The political reflections are always deep: in the *Pensieri*, as Capponi[2] says, he seems to aim at extracting through self-examination a quintessence, as it were, of the things observed and done by him,—thus endeavoring to form a political doctrine as adequate as possible in all its parts. Machiavelli and Guicciardini may be considered, not only as distinguished historians, but as originators of the science of history founded on observation.

Inferior to them, but still always worthy of note, were Jacopo Nardi (a just and faithful historian and a virtuous man, who defended the rights of Florence against the Medici before Charles V.), Benedetto Varchi, Giambattista Adriani, Bernardo Segni; and, outside Tuscany, Camillo Porzio, who related the *Congiura de' Baroni* and the history of Italy from 1547 to 1552, Angelo di Costanza, Pietro Bembo, Paolo Paruta, and others.

Romantic epic. Ariosto.

Ariosto's *Orlando Furioso* was a continuation of Boiardo's *Innamorato*. His characteristic is that he assimilated the romance of chivalry to the style and models of classicism. Ariosto was an artist only for the love of his art; his sole aim was to make a romance that should please the generation in which he lived. His *Orlando* has no grave and serious purpose; on the contrary it creates a fantastic world, in which the poet rambles, indulging his caprice, and sometimes smiling at his own work. His great desire is to depict everything with the greatest possible perfection; the cultivation of style is what occupies him most. In his hands, the style becomes wonderfully plastic to every conception, whether high or low, serious or sportive. The octave stanza reached in him the highest perfection of grace, variety, and harmony.

Heroic epic.

Meanwhile, side by side with the romantic, there was an attempt at the historical epic. Gian Giorgio Trissino of Vicenza composed a poem called *Italia liberata dai Goti*. Full of learning and of the rules of the ancients, he formed himself on the latter, in order to sing of the campaigns of Belisarius; he said that he had forced himself to observe all the rules of Aristotle, and that he had imitated Homer. In this again, we see one of the products of the Renaissance; and, although Trissino's work is poor in invention and without any original poetical coloring, yet it helps one to understand better what were the conditions of mind in the 16th century.

Lyric poetry.

Lyric poetry was certainly not one of the kinds that rose to any great height in the 16th century. Originality was entirely wanting, since it seemed in that century as if nothing better could be done than to copy Petrarch. Still, even in this style there were some vigorous poets. Monsignore Giovanni Guidiccioni of Lucca (1500–1541) showed that he had a generous heart. In fine sonnets he gave expression to his grief for the sad state to which his country was reduced. Francesco Molza of Modena (1489–1544), learned in Greek, Latin, and Hebrew, wrote in a graceful style and with spirit. Giovanni della Casa (1503–1556) and Pietro Bembo (1470–1547), although Petrarchists, were elegant. Even Michelangelo Buonarroti was at times a Petrarchist, but his poems bear the stamp of his extraordinary and original genius. And a good many ladies are to be placed near these poets, such as Vittoria Colonna (loved by Michelangelo), Veronica Gambara, Tullia d'Aragona, Giulia Gonzaga, poetesses of great delicacy, and superior in genius to many literary men of their time.

---

[1] Hitherto there has been no complete and objective study on Machiavelli, although very much has been written about him. This want, it is hoped, will be supplied when Signor Villari has completed his work, of which only the first volume has as yet appeared, *Niccolò Machiavelli e i suoi tempi illustrati con nuovi documenti*, Florence, 1877.

[2] *Storia della Repubblica di Firenze*, Florence, 1876.

Drama. The 16th century had not a few tragedies, but they are all weak. The cause of this was the moral and religious indifference of the Italians, the lack of strong passions and vigorous characters. The first to occupy the tragic stage was Trissino with his *Sofonisba*, following the rules of the art most scrupulously, but written in sickly verses, and without warmth of feeling. The *Oreste* and the *Rosmunda* of Giovanni Rucellai were no better, nor Luigi Alamanni's *Antigone*. Sperone Speroni in his *Canace* and Giraldi Cintio in his *Orbecche* tried to become innovators in tragic literature, but they only succeeded in making it grotesque. Decidedly superior to these was the *Torrismondo* of Torquato Tasso, especially remarkable for the choruses, which sometimes remind one of the chorus of the Greek tragedies.

The Italian comedy of the 16th century was almost entirely modelled on the Latin comedy. They were almost always alike in the plot, in the characters of the old man, of the servant, of the waiting-maid; and the argument was often the same. Thus the *Lucidi* of Agnolo Firenzuola, and the *Vecchio Amoroso* of Donato Giannotti were modelled on comedies by Plautus, as were the *Sporta* by Gelli, the *Marito* by Dolce, and others. There appear to be only three writers who should be distinguished among the many who wrote comedies,—Machiavelli, Ariosto, and Giovan Maria Cecchi. In his *Mandragora* Machiavelli, unlike all the others, composed a comedy of character, creating types which seem living even now, because they were copied from reality seen with a finely observant eye. Ariosto, on the other hand, was distinguished for his picture of the habits of his time, and especially of those of the Ferrarese nobles, rather than for the objective delineation of character. Lastly, Cecchi left in his comedies a treasure of spoken language, which nowadays enables us in a wonderful way to make ourselves acquainted with that age. The notorious Pietro Aretino might also be included in the list of the best writers of comedy.

Burlesque and satire. The 15th century was not without humorous poetry; Antonio Cammelli, surnamed the Pistoian, is specially deserving of notice, because of his "pungent *bonhomie*," as Sainte-Beuve called it. But it was Francesco Berni who carried this kind of literature to perfection in the 16th century. From him the style has been called "bernesque" poetry. In the "Berneschi" we find nearly the same phenomenon that we already noticed with regard to *Orlando Furioso*. It was art for art's sake that inspired and moved Berni to write, as well as Anton Francesco Grazzini called Il Lasca, and other lesser writers. It may be said that there is nothing in their poetry; and it is true that they specially delight in praising low and disgusting things and in jeering at what is noble and serious. Bernesque poetry is the clearest reflection of that religious and moral scepticism which was one of the characteristics of Italian social life in the 16th century, and which showed itself more or less in all the works of that period, that scepticism which stopped the religious Reformation in Italy, and which in its turn was an effect of historical conditions. The Berneschi, and especially Berni himself, sometimes assumed a satirical tone. But theirs could not be called true satire. Pure satirists, on the other hand, were Antonio Vinciguerra, a Venetian, Lodovico Alamanni, and Ariosto, the last superior to the others for the Attic elegance of his style, and for a certain frankness, passing into malice, which is particularly interesting when the poet talks of himself.

Didactic works. In the 16th century there were not a few didactic works. In his poem of the *Api* Giovanni Rucellai approaches to the perfection of Virgil. His style is clear and light, and he adds interest to his book by frequent allusions to the events of the time. But of the didactic works that which surpasses all the others in importance is Baldassare Castiglione's *Cortigiano*, in which he imagines a discussion in the palace of the dukes of Urbino between knights and ladies as to what are the gifts required in a perfect courtier. This book is valuable as an illustration of the intellectual and moral state of the highest Italian society in the first half of the 16th century.

Fiction. Of the novelists of the 16th century, the two most important were Anton Francesco Grazzini and Matteo Bandello,—the former as playful and bizarre as the latter is grave and solemn. As part of the history of the times, we must not forget that Bandello was a Dominican friar and a bishop, but that notwithstanding his novels were very loose in subject, and that he often holds up the ecclesiastics of his time to ridicule.

Translations. At a time when admiration for qualities of style, the desire for classical elegance, was so strong as in the 16th century, much attention was naturally paid to translating Latin and Greek authors. Among the very numerous translations of the time those of the *Æneid* and of the *Pastorals* of Longus the Sophist by Annibal Caro are still famous; as are also the translations of Ovid's *Metamorphoses* by Giovanni Andrea dell' Anguillare, of Apuleius's *Golden Ass* by Firenzuola, and of Plutarch's *Lives* and *Moralia* by Marcello Adriani.

Tasso. The historians of Italian literature are even now in doubt whether Tasso should be placed in the period of the highest development of the Renaissance, or whether he should form a period by himself, intermediate between that and the one following. Certainly he was profoundly out of harmony with the century in which he lived. His religious faith, the seriousness of his character, the deep melancholy settled in his heart, his continued aspiration after an ideal perfection, all place him as it were outside the literary epoch represented by Machiavelli, by Ariosto, by Berni. As Carducci has well said, Tasso "is the legitimate heir of Dante Alighieri: he believes, and reasons on his faith by philosophy; he loves, and comments on his love in a learned style; he is an artist, and writes dialogues of scholastic speculation that would fain be Platonic." He was only eighteen years old when, in 1562, he tried his hand at epic poetry, and wrote *Rinaldo*, in which he said that he had tried to reconcile the Aristotelian rules with the variety of Ariosto. He afterwards wrote the *Aminta*, a pastoral drama of exquisite grace. But the work to which he had long turned his thoughts was an heroic poem, and that absorbed all his powers. He himself explains what his intention was in the three *Discorsi* written whilst he was composing the *Gerusalemme:* he would choose a great and wonderful subject, not so ancient as to have lost all interest, nor so recent as to prevent the poet from embellishing it with invented circumstances; he meant to treat it rigorously according to the rules of the unity of action observed in Greek and Latin poems, but with a far greater variety and splendor of episodes, so that in this point it should not fall short of the romantic poem; and finally, he would write it in a lofty and ornate style. This is what Tasso has done in the *Gerusalemme Liberata*, the subject of which is the liberation of the sepulchre of Jesus Christ in the 11th century by Godfrey of Bouillon. The poet does not follow faithfully all the historical facts, but sets before us the principal causes of them, bringing in the supernatural agency of God and Satan. The *Gerusalemme* is the best heroic poem that Italy can show. It approaches to classical perfection. Its episodes above all are most beautiful. There is profound feeling in it, and everything reflects the melancholy soul of the poet. As regards the style, however, although Tasso studiously endeavored to keep close to the classical models, one cannot help noticing that he makes excessive use of metaphor, of antithesis, of far-fetched conceits; and it is specially from this point of view that some historians have placed Tasso in the literary period generally known under the name of "Secentismo," and that others, more moderate in their criticism, have said that he prepared the way for it.

Period of decadence.

5. *Period of Decadence.*—From about 1559 began a period of decadence in Italian literature. The Spanish rule oppressed and corrupted the peninsula. The minds of men were day by day gradually losing their force; every high aspiration was quenched. No love of country could any longer be felt when the country was enslaved to a stranger. The suspicious rulers fettered all freedom of thought and word; they tortured Campanella, burned Bruno, made every effort to extinguish all high sentiment, all desire for good. Cesare Balbo says, "If the happiness of the masses consists in peace without industry, if the nobility's consists in titles without power, if princes are satisfied by acquiescence in their rule without real independence, without sovereignty, if literary men and artists are content to write, paint, and build with the approbation of their contemporaries, but to the contempt of posterity, if a whole nation is happy in ease without dignity and the tranquil progress of corruption,—then no period ever was so happy for Italy as the hundred and forty years from the treaty of Cateau Cambresis to the war of the Spanish succession." This period is known in the history of Italian literature as the Secentismo. Its writers, devoid of sentiment, of passion, of thoughts, resorted to exaggeration; they tried to produce effect with every kind of affectation, with bombast, with the strangest metaphors, in fact, with what in art is called mannerism, "barocchism." The utter poverty of the matter tried to cloak itself under exuberance of forms. It seemed as if the writers vied with one another as to who could best burden his art with useless metaphors, with phrases, with big-sounding words, with affectations, with hyperbole, with oddities, with everything that could fix attention on the outer form and draw it off from the substantial element of thought.

The Secentismo.

At the head of the school of the "Secentisti" comes Giovan Battista Marini of Naples, born in 1569, especially known by a poem called *L'Adone.* His aim was to excite wonder by novelties; hence the most extravagant metaphors, the most forced antitheses, the most far-fetched conceits, are to be found in his book. It was especially by antitheses that he thought he could produce the greatest effect. Sometimes he strings them together one after the other, so that they fill up whole stanzas without a break. Achillini of Bologna followed in Marini's steps. He had less genius, however, and hence his peculiarities were more extravagant, becoming indeed absolutely ridiculous. In general, we may say that all the poets of the 17th century were more or less infected with "Marinism." Thus Alessandro Guidi, although he does not attain to the exaggeration of his master, is emptily bombastic, inflated, turgid, while Fulvio Testi is artificial and affected. Yet Guidi as well as Testi felt the influence of another poet, Gabriello Chiabrera, born at Savona in 1552. In him the Secentismo took another character. Enamored as he said he was of the Greeks, he made new metres, especially in imitation of Pindar, treating of religious, moral, historical, and amatory subjects. It is easy to understand that a Pindaric style of poetry in the 17th century in Italy could not but end in being altogether artificial, without anything of those qualities which constitute the greatness of the Greek poet. Chiabrera, though elegant enough in form, proves empty of matter, and, in his vain attempt to hide this vacuity, has recourse to poetical ornaments of every kind. These again, in their turn, become in him a fresh defect. Nevertheless, Chiabrera's school, in the decadence of the 17th century, marks an improvement; and sometimes he showed that he had lyrical capacities, which in better literary surroundings would have brought forth excellent fruit. When he sings, for example, of the victories of the Tuscan galleys against the Turks and the pirates of the Mediterranean, he rises to grand imagery, and seems quite another poet.

Filicaia the Florentine has a certain lyric *élan*, particularly in the songs about Vienna besieged by the Turks, which seems to raise him more than the others above the vices of the time; but even in him we see clearly the rhetorical artifice and the falseness of the conceits. And in general all the lyric poetry of the 17th century may be said to have had the same defects, but in different degrees,—defects which may be summed up as absence of feeling and exaggeration of form. There was no faith; there was no love; and thus art became an exercise, a pastime, a luxury, for a servile and corrupt people.

The Arcadia.

The belief then arose that it would be sufficient to change the form in order to restore literature, in forgetfulness that every reform must be the effect of a change in social and moral conditions. Weary of the bombastic style of the 17th century, full of conceits and antithesis, men said—let us follow an entirely different line, let us fight the turgid style with simplicity. In 1690 the "Academy of Arcadia" was instituted. Its founders were Giovan Maria Crescimbeni and Gian Vincenzo Gravina. The Arcadia was so called because its chief aim and intention were to imitate in literature the simplicity of the ancient shepherds, who were fabulously supposed to have lived in Arcadia in the golden age. As the "Secentisti" erred by an overweening desire for novelty, which made them always go beyond the truth, so the Arcadians proposed to themselves to return to the fields of truth, always singing of subjects of pastoral simplicity. This was obviously nothing else than the substitution of a new artifice for the old one; and they fell from bombast into effeminacy, from the hyperbolical into the petty, from the turgid into the over-refined. The Arcadia was a reaction against Secentismo, but a reaction which, reversing the movement of that earlier epoch, only succeeded in impoverishing still further and completely withering up the literature. The poems of the "Arcadians" fill many volumes, and are made up of sonnets, madrigals, canzonets, and blank verse. The one who most distinguished himself among the sonneteers was Felice Zappi. Among the authors of songs Paolo Rolli was illustrious. Innocenzo Frugoni was more famous than all the others, a man of fruitful imagination but of shallow intellect, whose wordy verses nobody now reads.

Symptoms of revival. Scientific prose.

Whilst the political and social conditions in Italy in the 17th century were such as to make it appear that every light of intelligence, all spirit of liberty, was extinguished, there appeared in the Peninsula, by that law of reaction which in great part governs human events, some strong and independent thinkers, such as Bernardino Telesio, Giordano Bruno, Tommaso Campanella, Lucilio Vanini, who turned philosophical inquiry into fresh channels, and opened the way for the scientific conquests of Galileo Galilei, the great contemporary of Descartes in France and of Bacon in England. Galileo was not only a great man of science, but also occupied a conspicuous place in the history of letters. A devoted student of Ariosto, he seemed to transfuse into his prose the qualities of that great poet,—a clear and frank freedom of expression, a wonderful art of knowing how to say everything with precision and ease, and at the same time with elegance. Galileo's prose is in perfect antithesis to the poetry of his time. Perhaps it is the best prose that Italy has ever had; it is clear, goes straight to the point, is without rhetorical ornaments and without vulgar slips, artistic without appearing to be so.

Satire.

Another symptom of revival, a sign of rebellion against the vileness of Italian social life, is given us in satire and in particular in that of Salvator Rosa and Alessandro Tassoni. Salvator Rosa, born in 1615, near Naples, was a painter, a musician, and a poet. As a poet he showed that he felt the sad condition of his country, showed that he mourned over it, and gave vent to his feeling (as another satire-writer, Giuseppe Giusti, said) in *generosi rabuffi*. His exhortation to Italian poets to turn their thoughts to the miseries of their country as a subject for their song—their country languishing under the tyrant's hands—certain passages where he deplores the effeminacy of Italian habits, a strong apostrophe against Rome, make Salvator Rosa a precursor of the patriotic literature which inaugurated the revival of the 18th century. Tassoni, a man really quite exceptional in this century, was superior to Rosa. He showed independent judgment in the midst of universal servility, and his *Secchia Rapita* proved that he was an eminent writer. This is an heroic comic poem, which is at the same time an epic and a personal satire. He was bold enough to attack the Spaniards in his *Filippiche*, in which he urged Duke Carlo Emanuele of Savoy to persist in the war against them.

New political conditions.

6. *The Revival in the 18th Century.*—Having for the most part freed itself from the Spanish dominion in the 18th century, the political condition of Italy began to improve. Promoters of this improvement, which was shown in many civil reforms, were Joseph II., Leopold I., and Charles I. The work of these princes was copied from the philosophers, who in their turn felt the influence of a general movement of ideas, which was quietly working in many parts of Europe, and which came to a head in the French encyclopedists.

Historical works.

Giambattista Vico was a token of the awakening of historical consciousness in Italy. In his *Scienza Nuova* he applied himself to the investigation of the laws governing the progress of the human race, and according to which events are developed. From the psychological study of man he endeavored to infer the "comune natura delle nazioni," *i.e.*, the universal laws of history, or the laws by which civilizations rise, flourish, and fall.

From the same scientific spirit which animated the philosophical investigation of Vico, there was born a different kind of investigation, that of the sources of Italian civil and literary history. Lodovico Antonio Muratori, after having collected in one entire body (*Rerum Italicarum Scriptores*) the chronicles, the biographies, the letters, and the diaries of Italian history from 500 to 1500, after having discussed the most obscure historical questions in the *Antiquitates Italicæ Medii Ævi*, wrote the *Annali d'Italia*, minutely narrating facts derived from authentic sources. Muratori's associates in his historical researches were Scipione Maffei of Verona and Apostolo Zeno of Venice. In his *Verona illustrata* the former left, not only a treasure of learning, but an excellent specimen of historical monograph. The latter added much to the erudition of literary history, both in his *Dissertazioni Vossiane* and in his notes to the *Biblioteca dell' Eloquenza Italiana* of Monsignore Giusto Fontanini. Girolamo Tiraboschi and the Count Giovanni Maria Mazzuchelli of Brescia devoted themselves to literary history. The latter meant to give in his *Scrittori d'Italia*, not only the biography of all the writers, but an account of their works. Only six volumes were printed, containing the letters A and B; but the immense materials collected by him are in the Vatican library, and it is to be hoped that some day they may be arranged and published.

Social science.

While the new spirit of the times led men to the investigation of historical sources, it also led them to inquire into the mechanism of economical and social laws. Francesco Galiani wrote on currency; Gaetano Filangieri wrote a *Scienza della Legislazione*. Cesare Beccaria, in his treatise *Dei Delitti e delle Pene*, made a contribution to the reform of the penal system and promoted the abolition of torture.

Satire.

The man in whom above all others the literary revival of the 18th century was most conspicuously embodied was Giuseppe Parini. He was born in a Lombard village in 1729, was mostly educated at Milan, and as a youth was known among the Arcadian poets by the name of Darisbo Elidonio. Even as an Arcadian, however, Parini showed signs of departing from the common type. In a collection of poems that he published at twenty-three years of age, under the name of Ripano Eupilino, there are some pastoral sonnets in which the poet shows that he had the faculty of taking his scenes from real life, and also some satirical pieces in which he exhibits a spirit of somewhat rude opposition to his own times. These poems are perhaps based on reminiscences of Berni, but at any rate they indicate a resolute determination to assail boldly all the literary conventionalities that surrounded the author. This, however, was only the beginning of the battle. Parini lived in times of great social prostration. The nobles and the rich, all given up to ease and to silly gallantry, consumed their lives in ridiculous trifles or in shameless self-indulgence, wasting themselves on immoral "Cicisbeismo," and offering the most miserable spectacle of feebleness of mind and character. It was against this social condition that Parini's muse was directed. Already, improving on the poems of his youth, he had proved himself an innovator in his lyrics, rejecting at once Petrarchism, Secentismo, and Arcadia, the three maladies that had weakened Italian art in the centuries preceding his own, and choosing subjects taken from real life, such as might help in the instruction of his contemporaries. In the *Odi* the satirical note is already heard. But it came out more strongly in the poem *Del Giorno*, in which he imagines himself to be teaching a young Milanese patrician all the habits and ways of gallant life; he shows up all its ridiculous frivolities, and with delicate irony unmasks the futilities of aristocratic habits. Dividing the day into four parts, the Mattino, the Mezzogiorno, the Vespero, the Notte, by means of each of these he describes the trifles of which they were made up, and the book thus assumes a social and historical value of the highest importance. Parini, satirizing his time, fell back upon truth, and finally made art serve the purpose of civil morality. As an artist, going straight back to classical forms, aspiring to imitate Virgil and Dante, he opened the way to the fine school that we shall soon see rise, that of Alfieri, Foscolo, and Monti. As a work of art, the *Giorno* is wonderful for the Socratic skill with which that delicate irony is constantly kept up by which he seems to praise what he effectually blames. The verse has new harmonies; sometimes it is a little hard and broken, not by accident, but as a protest against the Arcadian monotony. Generally it flows majestically, but without that Frugonian droning that deafens the ears and leaves the heart cold.

Gasparo Gozzi's satire was less elevated, but directed towards the same end as Parini's. In his *Osservatore*, something like Addison's *Spectator*, in his *Gazzetta Veneta*, in the *Mondo Morale*, by means of allegories and novelties he hit the vices with a delicate touch, and inculcated a practical moral with much good sense. Gozzi's satire has some slight resemblance in style to Lucian's. It is smooth and light, but withal it does not go less straight to its aim, which is to point out the defects of society and to correct them. Gozzi's prose is very graceful and lively. It only errs by its overweening affectation of imitating the writers of the 14th century. Another satirical writer of the first half of the 18th century was Giuseppe Baretti of Turin. In a journal called the *Frusta Letteraria* he took to lashing without mercy the works which were then being published in Italy. He had learnt much by travelling; and especially his long stay in England had contributed to give an independent character to his mind, and made him judge of men and things with much good sense. It is true that his judgments are not always right, but the *Frusta Letteraria* was the first book of independent criticism, directed particularly against the Arcadians and the pedants.

Dramatic reform.

Everything tended to improvement, and the character of the reform was to throw off the conventional, the false, the artificial, and to return to truth. The drama felt this influence of the times. Apostolo Zeno and Metastasio (the Arcadian name for Pietro Trapassi, a native of Rome) had endeavored to make "melodrama and reason compatible." The latter in particular succeeded in giving fresh expression to the affections, a natural turn to the dialogue, and some interest to the plot; and if he had not fallen into constant unnatural over-refinement and unseasonable mawkishness, and into frequent anachronisms, he might have been considered as the first dramatic reformer of the 18th century. That honor belongs to Carlo Goldoni, a Venetian. He found comedy either entirely devoted to classical imitation, or given up to extravagance, to *coups de théâtre*, to the most boisterous succession of unlikely situations, or else treated by comic actors who recited impromptu on a given subject, of which they followed the outline. In this old popular form of comedy, with the masks of pantaloon, of the doctor, of harlequin, of Brighella, etc., Goldoni found the strongest obstacles to his reform. But at last he conquered, creating the comedy of character. No doubt Molière's example helped him in this. Goldoni's characters are always true, but often a little superficial. He studied nature, but he did not plunge into psychological depths. In most of his creations, the external rather than the internal part is depicted. In this respect he is much inferior to Molière. But on the other hand he surpasses him in the liveliness of the dialogue, and in the facility with which he finds his dramatic situations. Goldoni wrote much, in fact too much (more than one hundred and fifty comedies), and had no time to correct, to polish, to perfect his works, which are all rough cast. But for a comedy of character we must go straight from Machiavelli's *Mandragora* to him. Goldoni's dramatic aptitude is curiously illustrated by the fact that he took nearly all his types from Venetian society, and yet managed to give them an inexhaustible variety. A good many of his comedies were written in Venetian dialect, and these are perhaps the best.

Patriotic literature and return to classicisms.

The ideas that were making their ways in French society in the 18th century, and afterwards brought about the Revolution of 1789, gave a special direction to Italian literature of the second half of the 18th century. Love of ideal liberty, desire for equality, hatred of tyranny, created in Italy a literature which aimed at national objects, seeking to improve the condition of the country by freeing it from the double yoke of political and religious despotism. But all this was associated with another tendency. The Italians who aspired to a political redemption believed that it was inseparable from an intellectual revival, and it seemed to them that this could only be effected by a reunion with ancient classicism,—in other words, by putting themselves in more direct communication with ancient Greek and Latin writers. This was a repetition of what had occurred in the first half of the 15th century. The 17th century might in fact be considered as a new Italian Middle Age without the hardness of that iron time, but corrupted, enervated, overrun by Spaniards and French, an age in which previous civilization was cancelled. A reaction was necessary against that period of history, and a construction on its ruins of a new country and a new civilization. There had already been forerunners of this movement; at the head of them the revered Parini. Now the work must be completed, and the necessary force must once more be sought for in the ancient literature of the two classic nations. Patriotism and classicism then were the two principles that inspired the literature which began with Alfieri. He worshipped the Greek and Roman idea of popular liberty in arms against the tyrant. He took the subjects of his tragedies almost invariably from the history of these nations, made continual apostrophes against the despots, made his ancient characters talk like revolutionists of his time; he did not trouble himself with, nor think about, the truth of the characters; it was enough for him that his hero was Roman in name, that there was a tyrant to be killed, that liberty should triumph in the end. But even this did not satisfy Alfieri. Before his time and all about him there was the Arcadian school, with its foolish verbosity, its empty abundance of epithets, its nauseous pastoralizing on subjects of no civil importance. It was necessary to arm the patriotic muse also against all this. If the Arcadians, not excluding the hated Metastasio, diluted their poetry with languishing tenderness, if they poured themselves out in so many words, if they made such set phrases, it behoved the others to do just the contrary, to be brief, concise, strong, bitter, to aim at the sublime as opposed to the lowly and pastoral. Having said this, we have told the good and evil of Alfieri. He desired a political reform by means of letters; he saved literature from Arcadian vacuities, leading it towards a national end; he armed himself with patriotism and classicism in order to drive the profaners out of the temple of art. But in substance he was rather a patriot than an artist. In any case the results of the new literary movement were copious.

Alfieri.

Foscolo.

Ugo Foscolo was an eager patriot, who carried into life the heat of the most unbridled passion, and into his art a rather rhetorical manner, but always one inspired by classical models. His life was a most exciting one: he was a soldier with General Massena, a professor of eloquence at the university of Pavia, an exile after 1815. Three strong passions were always united in him—a passion for Italy, for art, and for beautiful women. Foscolo was born at Zante, and took pride in being a Greek. He translated some books of the *Iliad*, and the *Coma Berenices* of Catullus. He studied classical authors widely, and in his original works the reflection of them is perceptible. The *Lettere di Jacopo Ortis*, inspired by Goethe's *Werther*, are a love story with a mixture of patriotism; they contain a violent protest against the treaty of Campo Formio, and an outburst from Foscolo's own heart about an unhappy love-affair of his. His passions were sudden and violent; they came to an end as abruptly as they began; they were whirlwinds that were over in a quarter of an hour. To one of these passions *Ortis* owed its origin, and it is perhaps the best, the most sincere, of all his writings. Even in it he is sometimes pompous and rhetorical, but much less so than he is, for example, in the lectures *Dell' Origine e dell' Ufficio della Letteratura*. On the whole, Foscolo's prose is turgid and affected, and reflects the character of the man who always tried to pose, even before himself, in dramatic attitudes. This was indeed the defect of the Napoleonic epoch; there was a horror of anything common, simple, natural; everything must be after the model of the hero who made all the world gaze with wonder at him; everything must assume some heroic shape. In Foscolo this tendency was excessive; and it not seldom happened that, in wishing to play the hero, the exceptional man, the little Napoleon of ladies' drawing-rooms, he became false and bad, false in his art, bad in his life. The *Sepolcri*, which is his best poem, was prompted by high feeling, and the mastery of versification shows wonderful art. Perhaps it is to this mastery more than to anything else that the admiration the *Sepolcri* excites is due. There are most obscure passages in it, as to the meaning of which it would seem as if even the author himself had not formed a clear idea. He left incomplete three hymns to the Graces, in which he sang of beauty as the source of courtesy, of all high qualities, and of happiness. Here again what most excites our admiration is the harmonious and easy versification. Among his prose works a high place belongs to his translation of the *Sentimental Journey* of Sterne, a writer by whom one can easily understand how Foscolo should have been deeply affected. He went as an exile to England, and died there. He wrote for English readers some *Essays* on Petrarch and on the texts of the *Decamerone* and of Dante, which are remarkable for the time at which they were written, and which may be said to have initiated a new kind of literary criticism in Italy. Foscolo is still greatly admired, and not without reason. His writings stimulate the love of fatherland, and the men that made the revolution of 1848 were largely brought up on them. Still, his fame both as a man and as an artist is now on the decline.

Monti.

If in Foscolo patriotism and classicism were united and formed almost one passion, so much cannot be said of Vincenzo Monti, in whom the artist was absolutely predominant. Yet we must be careful: Monti was a patriot too, but in his own way. He had no one deep feeling that ruled him, or rather the mobility of his feelings is his characteristic; but each of these was a new form of patriotism, that took the place of an old one. He saw danger to his country in the French Revolution, and wrote the *Pellegrino Apostolico*, the *Bassvilliana*, and the *Feroniade;* Napoleon's victories caused him to write the *Prometeo* and the *Musagonia;* in his *Fanatismo* and his *Superstizione* he attacked the papacy; afterwards he sang the praises of the Austrians. Thus every great event made him change his mind, with a readiness which might seem incredible, but is yet most easily explained. Monti was above everything an artist; art was his real, his only passion; everything else in him was liable to change, that alone was persistent. Fancy was his tyrant, and under its rule he had no time to reason and to see the miserable aspect of his political tergiversation. It was an overbearing deity that moved him, and at its dictation he wrote. Pius VI., Napoleon, Francis II., were to him but passing shadows, to which he hardly gives the attention of an hour; that which endures, which is eternal to him, is art alone. It were unjust to accuse Monti of baseness. If we say that nature in giving him one only faculty had made the poet rich and the man poor, we shall speak the truth. But the poet was indeed rich. Knowing little Greek, he succeeded in making a translation of the *Iliad* which is remarkable for its Homeric feeling, and in his *Bassvilliana* he is on a level with Dante. In fine, in him classical poetry seemed to revive in all its florid grandeur.

Niccolini.

Monti was born in 1754, Foscolo in 1778; four years later still was born another poet of the same school, Giambattista Niccolini. In literature he was a classicist; in politics he was a Ghibelline, a rare exception in Guelph Florence, his birthplace. In translating or, if the expression is preferred, imitating Æschylus, as well as in writing the *Discorsi sulla Tragedia Greca*, and on the *Sublime e Michelangelo*, Niccolini displayed his passionate devotion to ancient literature. In his tragedies he set himself free from the excessive rigidity of Alfieri, and partly approached the English and German tragic authors. He nearly always chose political subjects, striving to keep alive in his compatriots the love of liberty. Such are *Nabucco*, *Antonio Foscarini*, *Giovanni da Procida Lodovico il Moro*, etc. He assailed papal Rome in *Arnaldo da Brescia*, a long tragic piece, not suited for acting, an epic rather than dramatic. Niccolini's tragedies show a rich lyric vein rather than dramatic genius. At any rate he has the merit of having vindicated liberal ideas, and of having opened a new path to Italian tragedy.

Historians.

The literary period we are dealing with had three writers who are examples of the direction taken by historical study. It seems strange that, after the learned school begun by Muratori, there should have been a backward movement here, but it is clear that this retrogression was due to the influence of classicism and patriotism, which, if they revived poetry, could not but spoil history. Carlo Botta, born in 1766, was a spectator of French spoliation in Italy and of the overbearing rule of Napoleon. Hence, excited by indignation, he wrote a *History of Italy from 1789 to 1814*; and later on he continued Guicciardini's *History* up to 1789. He wrote after the manner of the Latin authors, trying to imitate Livy, putting together long and sonorous periods in a style that aimed at being like Boccaccio's, caring little about that which constitutes the critical material of history, only intent on declaiming his academic prose for his country's benefit. Botta wanted to be classical in a style that could no longer be so, and hence he failed completely to attain his literary goal. His fame is only that of a man of a noble and patriotic heart. Not so bad as the two histories of Italy is that of the *Guerra dell' Indipendenza Americana*.

Close to Botta comes Pietro Colletta, a Neapolitan born nine years after him. He also in his *Storia del Reame di Napoli dal 1734 al 1825* had the idea of defending the independence and liberty of Italy in a style borrowed from Tacitus; and he succeeded rather better than Botta. He has a rapid, brief, nervous style, which makes his book attractive reading. But it is said that Pietro Giordani and Gino Capponi corrected it for him. Lazzaro Papi of Lucca, author of the *Commentari della Rivoluzione Francese dal 1789 al 1814*, was not altogether unlike Botta and Colletta. He also was an historian in the classical style, and treats his subject with patriotic feeling; but as an artist he perhaps excels the other two.

The purists.

At first sight it seems unnatural that, whilst the most burning political passions were raging, and whilst the most brilliant men of genius in the new classical and patriotic school were at the height of their influence, a question should have arisen about "purism" of language. Yet the phenomenon can be easily accounted for. Purism is another form of classicism and patriotism. In the second half of the 18th century the Italian language was specially full of French expressions. There was great indifference about fitness, still more about elegance of style. Prose then was to be restored for the sake of national dignity, and it was believed that this could not be done except by going back to the writers of the 14th century, to the "aurei trecentisti," as they were called, or else to the classics of Italian literature. One of the promoters of the new school was Antonio Cesari of Verona, who republished ancient authors, and brought out a new edition, with additions, of the *Vocabolario della Crusca*. He wrote a dissertation *Sopra lo stato presente della Lingua Italiana*, and endeavored to establish the supremacy of Tuscan and of the three great writers Dante, Petrarch, Boccaccio. And in accordance with that principle he wrote several books, taking pains to copy the "trecentisti" as closely as possible. But patriotism in Italy has always had something municipal in it; so to this Tuscan supremacy, proclaimed and upheld by Cesari, there was opposed a Lombard school, which would know nothing of Tuscan, and with Dante's *De Vulgari Eloquio* returned to the idea of the "lingua illustre." This was an old question, largely and bitterly argued in the Cinquecento (16th century) by Varchi, Muzio, Castelvetro, Speroni, and others. Now the question came up again quite fresh, as if no one had ever discussed it before. At the head of the Lombard school were Monti, and his son-in-law Count Giulio Perticari. This gave Monti an occasion to write *Proposta di alcune Correzioni ed Aggiunte al Vocabolario della Crusca*, in which he attacked the Tuscanism of the *Crusca*, but in a graceful and easy style, such in fact as to form a prose that is one of the most beautiful in Italian literature. Perticari on the other hand, with a very inferior intellect, narrowed and exasperated the question in two treatises *Degli Scrittori del Trecento* and *Dell' Amor Patrio di Dante*, in which, often disguising or altering the facts, he only makes confusion where there was none. Meantime, however, the impulse was given. The dispute about language took its place beside literary and political disputes, and all Italy took part in it,—Bassilio Puoti at Naples, Paolo Costa in the Romagna, Marc' Antonio Parenti at Modena, Salvatore Betti at Rome, Giovanni Gherardini in Lombardy, Luigi Fornaciari at Lucca, Vincenzo Nannucci at Florence.

Giordani.

A patriot, a classicist, and a purist all at once was Pietro Giordani, born in 1774; he was almost a compendium of the literary movement of the time. His whole life was a battle fought for liberty. Most learned in Greek and Latin authors, and in the Italian trecentisti, he only left a few writings behind him, but they were carefully elaborated in point of style, and his prose was in his time considered wonderful. Now it is looked on as too majestic, too much labored in phrases and conceits, too far from nature, too artificial. Giordani closes the literary epoch of the classicists.

Contemporary literature.

7. *Contemporary Period.*—At this point the contemporary period of literature begins. It has been said that the first impulse was given to it by the romantic school, which had as its organ the *Conciliatore* established in 1818 at Milan, and on the staff of which were Silvio Pellico, Lodovico di Breme, Giovile Scalvini, Tommaso Grossi, Giovanni Berchet, Samuele Biava, and lastly Alessandro Manzoni. It need not be denied that all these men were influenced by the ideas that, especially in Germany, at the beginning of the 19th century constituted the movement called Romanticism. Nevertheless in Italy the course of literary reform took another direction. There is no doubt that the real head of the reform, or at least its most distinguished man, was Alessandro Manzoni. He formulated in a letter of his the objects of the new school, saying that it aspired to try and discover and express "il vero storico" and "il vero morale," not only as an end, but as the widest and eternal source of the beautiful. And it is precisely realism in art that characterizes Italian literature from Manzoni onwards. The *Promessi Sposi* is the one of his works that has made him immortal. No doubt the idea of the historical novel came to him from Sir Walter Scott, but he succeeded in something more than an historical novel in the narrow meaning of that word; he created an eminently realistic work of art. The romance disappears; no one cares for the plot, which moreover is of very little consequence. The attention is entirely fixed on the powerful objective creation of the characters. From the greatest to the least they have a wonderful verisimilitude; they are living persons standing before us, not with the qualities of one time more than another, but with the human qualities of all time. Manzoni is able to unfold a character in all particulars, to display it in all its aspects, to follow it through its different phases. He is able also to seize one moment, and from that moment to make us guess all the rest. Don Abbondio and Renzo are as perfect as Azzeccagarbugli and Il Sarto. Manzoni dives down into the innermost recesses of the human heart, and draws thence the most subtle psychological reality. In this his greatness lies, which was recognized first by his companion in genius, Goethe. With the exception of the *Promessi Sposi*, his works are important for the history of the author's mind, not for the history of literature. Some of them are rather in contrast to that masterpiece. It is chiefly the *Inni Sacri* and the two tragedies that explain why Manzoni became the head of the school of Romanticism. It is not to be denied that even as a poet he had gleams of genius, especially where he describes human affections, as in some stanzas of the *Inni* and in the chorus of the *Adelchi*. But it is the *Promessi Sposi* alone that places him at the head of the Italian literature of the 19th century, on account of the artistic realism prevailing in it. But Manzoni shared this glory with another writer, Giacomo Leopardi. It may seem absurd, but still it is the case, that the mystic, the religious Manzoni, has his place side by side with the poet of atheism and despair; they are indissolubly bound together for all time by an artistic intention, identical although realized by different means. Leopardi was born thirteen years after Manzoni at Recanati, of a patrician family, bigoted and avaricious, and he almost entirely educated himself. His body was deformed, and he was of a sickly habit, so that in the years that bring cheerfulness and laughter to youths and children he shut himself up in his father's library and studied. He became so familiar with Greek authors that he used afterwards to say that the Greek mode of thought was more clear and living to his mind than the Latin or even the Italian. Solitude, sickness, domestic tyranny, prepared him for profound melancholy. From this he passed into complete religious scepticism. He sought rest in art, and first wrote a *Canzone all' Italia* and another for the monument of Dante Alighieri (1818), both full of classical and patriotic feeling. They show that for the time, though only for the time, he was of the school of Alfieri, Foscolo, and the others we have spoken of. His love of classicism always continued, but he changed its subject. He passed on into the poetry of sentiment and nature, describing with an unsurpassable realism what he felt and saw. The *Passero Solitario*, the *Quiete dopo la Tempesta*, the *Sabato del Villaggio*, are pictures in which objective realism reaches its highest ideality; whilst beside them there are the *Ultimo Canto di Saffo*, the *Ricordanze*, the *Genestra*, and other poems, in which is poured out all the sorrow that weighs on the unhappy man to whom nature has denied every joy and every happiness. Everything is terrible and grand in these poems, which are the most agonizing cry in modern literature, uttered with a solemn quietness that at once elevates and terrifies us. The poetry of despair never had a more powerful or a more sorrowful voice than this. In this Leopardi surpasses even Byron and Shelley. But, besides being the greatest poet of nature and of sorrow, he was also an excellent prose writer. In his *Operette Morali*—dialogues and discourses marked by a cold and bitter smile at human destinies which freezes the reader—the clearness of style, the simplicity of language, and the depth of conception are such that perhaps he is not only the first poet since Dante, but also the most perfect writer of prose that Italian literature has had.

As realism in art gained ground, the positive method in criticism kept pace with it. From the manner of Botta and Colletta history returned to its spirit of learned research, as is shown in such works as the *Archivio Storico Italiano*, established at Florence by Giampietro Vieusseux, the *Storia d' Italia nel Medio Evo* by Carlo Troya, a remarkable treatise by Manzoni himself, *Sopra alcuni Punti della storia Longobardica in Italia*, and the very fine history of the *Vespri Siciliani* by Michele Amari. The same positive method is now being applied to literary history.

But alongside of the great artists Leopardi and Manzoni, alongside of the learned scholars, there was also in the first half of the 19th century a patriotic literature. To a close observer it will appear that historical learning itself was inspired by the love of Italy. It is well known what Vieusseux's intentions were when he established the *Antologia*, in which work all Italian liberals took part, and which was suppressed by the action of the Russian Government. And it is equally well known that the *Archivio Storico Italiano* was, under a different form, a continuation of the *Antologia*. Florence was in those days the asylum of all the Italian exiles, and these exiles met and shook hands in Vieusseux's rooms, where there was more literary than political talk, but where one thought and one only animated all minds, the thought of Italy.

The literary movement which preceded and was contemporary with the political revolution of 1848 may be said to be represented by four writers,—Giuseppe Giusti, Francesco Domenico Guerrazzi, Vincenzo Gioberti, and Cesare Balbo. Giusti wrote epigrammatic satires in popular language. In incisive phrase he scourged the enemies of Italy; his manner seemed very original, but it really was partly imitated from Beranger. He was a telling political writer, but a mediocre poet,—too much a poet of occasion. Few of his verses will survive as works of art. Guerrazzi had a great reputation and great influence; he was the author of historical novels written with a political object, such as the *Assedio di Firenze*, the *Battaglia di Benevento*, etc. Read with feverish avidity before 1848, these books of his are now almost forgotten. They struck the imagination then by their style, which is partly affected and partly spasmodic. They seemed to be sublime, but were little less than ridiculous. Gioberti had a noble heart and a great mind; his philosophical works are already as good as dead, but the *Primato morale e civile degli Italiani* will last as an important document of the times. It is a book false in substance, but inspired by lofty sentiments, and it is written in an easy and eloquent style, although sometimes a little verbose. The *Gesuita moderno* will live as the most tremendous indictment ever written against the Jesuits. Gioberti was a powerful polemical writer; and in polemics he showed his most original and characteristic qualities. Balbo was an earnest student of history, and made history useful for politics. Like Gioberti in his first period, Balbo was zealous for the civil papacy, and for a federation of the Italian states presided over by it. His *Sommârio della Storia d' Italia* is the best epitome that exists of the intricate history of Italy. In the *Pensieri sulla Storia d' Italia* he touched on important subjects, which still await treatment. He did not do himself justice in the *Meditazioni Storiche*, a work on the philosophy of history, for which he had not the necessary qualifications.

It is not advisable to speak of living authors. We shall only notice the fact that the political revival in Italy seems to have brought forth good fruit also in the fields of literature. It appears that the literary bent of the present day is towards historical research. Of the poets, only one, Giosuè Carducci, has as yet acquired a reputation that seems certain to last.

Literature.—The following are the more important recent works relating to the history of Italian literature:—Emiliani Giudici, *Storia della Letteratura Italiana*, 2 vols., Florence, 1855; Francesco de Sanctis, *Storia della Letteratura Ituliana*, 2 vols., Naples, 1870; Adolfo Bartoli, *Storia della Letteratura Italiana* (the first three volumes are published), Florence, 1879–80; Giosuè Carducci, *Studi Letterari*, Leghorn, 1874; Alessandro d'Ancona; *Origini del Teatro in Italia*, 2 vols., Florence, 1878; Virgili, *Francesco Berni*, Florence, 1881; Pasquale Villari, *Niccolò Machiavelli e i suoi tempi*, vol. i., Florence, 1877; Pio Rajna, *Le Fonti dell' Orlando Furioso*, Florence, 1875; Attilio Hortis, *Studi sulle Opere latine del Boccaccio*, Trieste, 1879; Francesco de Sanctis, *Saggi Critici*, 3 vols., Naples, 1872; Francesco d'Ovidio, *Saggi Critici*, Naples, 1878. ITHACA ('Ιθάκη), vulgarly Thiaki (Θιάκη), is next to Pasco the smallest of the seven Ionian Islands, with an area of about 44 square miles. It forms an eparchy of the nomos of Cephalonia in the kingdom of Greece, and its population, which was 9873 in 1870, is given by the census of 1879 at 12,222, of whom 6305 were males. The island consists of two mountain masses, connected by a narrow isthmus of hills, and separated by a wide inlet of the sea known as the Gulf of Molo. The northern and greater mass culminates in the heights of Anoi (2066 feet), and the southern in Hagios Stephanos, or Mount Marovugli (2135 feet). Vathy (Βαθύ), the chief town and port of the island, lies at the northern foot of Mount Stephanos, its whitewashed houses stretching for about a mile round the deep bay in the Gulf of Molo, to which it owes its name (*cf.* Dieppe and such Dutch names as Hollands Diep). As there are only one or two small stretches of arable land in Ithaca, the inhabitants are dependent on commerce for their grain supply; and olive oil, wine, and currants are the principal products obtained by the cultivation of the thin stratum of soil that covers the calcareous rocks. Goats are fed in considerable number on the brushwood pasture of the hills; and hares (in spite of Aristotle's supposed assertion of their absence) are exceptionally abundant. The island is divided into four districts:—Vathy, Aeto (or Eagle's Cliff), Anoge (Anoi) or Upland, and Exoge (Exoi) or Outland.

The name Ithaca (Ιτύκη), like Utica, has been explained by עתוק, a "colony," which would point to a Phœnician connection. It has remained attached to the island from the very earliest times with but little interruption of the tradition; though in Brompton's travels (12th century) and in the old Venetian maps we find it called Fale or Val de Compar, and at a later date it not unfrequently appears as Little Cephalonia. This last name indicates the general character of Ithacan history (if history it can be called) in modern and indeed in ancient times; for the fame of the island is almost solely due to its position in the Homeric story of Ulysses. Ithaca, according to the Homeric epos, was the royal seat and residence of King Ulysses, and within its narrow limits lies the scene of much of the poem. The island is incidentally described with no small variety of detail, picturesque and topographical; but the very apparent definiteness of the description has rendered the process of identification peculiarly perplexing, and the coincidences between the Ithaca of the *Odyssey* and the Ithaca of the present day are sometimes as puzzling as the points of disagreement. The phraseology in which the position of the island is indicated is of doubtful interpretation, and the important word χθαμαλή would have naturally been rendered "low-lying" if stress of present fact had not forced the commentators to find or fancy such significations as "with low shores" (the shores after all being rather unusually high) or "slanting downwards." The Homeric localities for which counterparts have been sought are Mount Neritos, Mount Neion, the harbor of Phorcys, the town and palace of Ulysses, the fountain of Arethusa, the cave of the Naiads, the stalls of the swineherd Eumæus, the orchard of Laertes, and the Korax or Raven Cliff. The master site may be said to be that of the town; and several of the minor points may be at once dismissed as hopeless of all certainty of recognition. Among the "identificationists" there are two schools, one placing the town at Polis on the west coast in the northern half of the island (Leake, Gladstone, etc.), and the other at Aeto on the isthmus. The latter site, which was advocated by Sir William Gell (*Topography and Antiquities of Ithaca*, London, 1807), has received a great accession to its probability as opposed to the rival theory by the excavations of Dr. Schliemann carried on in 1873 and 1878 (see Schliemann, *Ithaque, le Péloponnèse, Troie*, Paris, 1869, also published in German; his letter to *The Times*, September 26, 1878; and the author's life prefixed to *Ilios*, London, 1880). He found that the valley called Polis or city has never been the site of a town, and that the apparent ruins on a neighboring height supposed to be the acropolis are really a group of castellated rocks. Remains of Cyclopean structures at the spot known as Homer's school (a name of the most modern origin) were the only evidence in favor of the existence of a town in the northern part of the island. On the ridge of Mount Aeto, on the other hand, he found vast Cyclopean walls built of stones even larger than those of Mycenæ and Tiryns; and within the area which they enclose there may have been, he calculates, 2000 houses similar to those which he actually made out to the number of 190. Fragments of pottery of a Trojan type, of tiles with impressed ornaments, and of a curious handmill were the only relics of the former inhabitants. "In the south-eastern extremity of the island are a number of rooms like stables, averaging 35 feet in length and 10 feet in breadth, partly rock-cut, partly formed by Cyclopean walls of very huge rudely wrought stones, and in their immediate vicinity thousands of very common but most ancient potsherds." Mr. Bunbury (*His. of Ancient Geography*, vol. i. p. 83) is disposed to consider this evidence conclusive as to the site of the capital.

See, besides the works already referred to, the separate works on Ithaca by Schreiber, Leipsic, 1829; Rühle von Lilienstern, Berlin, 1832; N. Karavias Grivas ('Ιστορία τῆς νήσου Ιθακης), Athens, 1849; Bowen, London, 1851; and Gandar, Paris, 1854; Hercher, in *Hermes*, 1866; Leake's *Northern Greece;* Mure's *Tour in Greece;* Bursian's *Geogr. von Griechenland;* Gladstone, "The Dominions of Ulysses," in *Macmillan's Magazine*, 1877. A history of the discussions will be found in Buchholz, *Die Homerische Realien*, Leipsic, 1871.

ITHACA, the chief town of Tompkins county, New York, U. S., is prettily situated in a township of the same name on the Cayuga Inlet, 1½ miles from the southern end of Lake Cayuga, and 142 miles west by south of Albany. It is at the junction of several railways, has gas and water works, and carries on some commerce, of which the shipping of coal from the Pennsylvania anthracite district forms an important constituent. The manufactures include agricultural implements, paper, glass, leather, and machinery. On an eminence to the north-east rise the handsome buildings of Cornell university, chartered in 1865 and opened in 1868, in which a marked characteristic is the prominence given to the study of agriculture and the mechanical arts. Sage College was presented to the university by the Hon. H. W. Sage, on condition that women should have the same advantages for education as men. The public library of Ithaca was built and stocked at a cost of £13,000 by the same munificent citizen whose endowment of the university is commemorated in its name. The neighborhood of Ithaca is remarkable for the number of its waterfalls, of which Ithaca Fall, 160 feet high by 150 feet broad, is the chief. The population of the town in 1880 was 9864.

ITINERARIUM. This Latin word, equivalent to road-book, is more particularly employed to designate the descriptions still extant of the ancient Roman roads and routes of traffic, with the stations and distances. It is usual to distinguish two classes, *Itineraria Adnotata* or *Scripta* and *Itineraria Picta*,—the former having the character of a book, and the latter being a graphic indication of the route in the form of a chart. Of the Itineraria Scripta the most important are:—(1) *It. Antonini* (see ANTONINI ITINERARIUM and ANTONINUS), which consists of two parts, the one dealing with roads in Europe, Asia, and Africa, and the other with familiar sea-routes,—the distances usually measured from Rome (the better MSS. probably represent a revision dating from the time of Diocletian; edited by Tobler, St. Gall, 1863); (2) *It. Hierosolymitanum* or *Burdigalense*, which belongs to the 4th century, and contains the route from Bordeaux to Jerusalem and from Heraclea by Rome to Milan (see Pindar in *Verhandl.* of the Berlin Academy, 1860; A. de Barthélémy in *Revue Archéol.*, 1864; Aurès, *Concordance des voies apollinaires*, etc., Nîmes, 1868); (3) *It. Alexandri*, containing a sketch of the march-route of Alexander the Great, mainly derived from Arrian and prepared for Constantius's expedition in 340–345 A.D. (first ed. by Mai, Milan, 1817, since by C. Müller in Dübner's *Arrianus*, Paris, 1846, and by D. Volkmann, Naumb., 1871: see Kluge, *De itin. Alexandri*, Berlin, 1861). A collected edition of the ancient itineraria was issued by Fortia d'Urban, Paris, 1845. Of the Itineraria Picta only one great example has been preserved. This is the famous *Tabula Peutingeriana*, which, without attending to the shape or relative position of the countries, represents by straight lines and dots of various sizes the roads and towns of the whole Roman world. The best edition is by Desjardins, Paris, 1868.

ITIUS PORTUS, a place of no importance in itself, has a kind of factitious interest as the point whence Julius Cæsar sailed from Gaul to Britain. Although Cæsar does not mention the Portus in speaking of his first expedition (55 B.C.), his language in describing it as the naval rendezvous before his second invasion (54 B.C.) leaves little doubt that he had sailed from it before. To determine, therefore, the site of the Portus Itius, while it would decide one of the most vexed questions of either ancient or modern geography, would go far to fix the spot where the great captain first set foot in England. It is impossible here to describe the controversy, or to detail the arguments which at one time or another have been advanced in favor of every bay between Calais and Boulogne. Modern criticism selects four sites as probable—Boulogne, Wissant, Ambleteuse, and the mouth of the Somme. The first two number most adherents; and in recent criticism Wissant, about 3¼ miles north-east of Cape Grisnez (*Itium Promontorium*), has united a majority of voices.

The question turns upon the interpretation of certain passages in Cæsar's *De Bello Gallico* (iv. 20 *sq.*, v. 1 *sq.*), with direct and indirect mentions in other Latin and Greek writers. See also Camden's *Britannia*, 1659; Du Cange, *Dissertations sur la Vie de Saint Louis*, diss. xxviii., "Portus Itius," 1678; D'Anville, "Dissertation sur le portus Itius," in *Mémoires de l'Academie des Inscriptions*, xxiii., 1761; Airy, "On the place of Julius Cæsar's Departure from Gaul, etc.," in *Archæologia*, 1862; papers by Airy and Guest in the *Athenæum*, 1851, 1859, 1863; by George Long in the *Reader* of 1863; by H. L. Long in *Gentleman's Magazine*, 1846; and an elaborate article by H. J. Heller in the *Zeitschrift für Allgemeine Erdkunde*, vol. xviii., Berlin, 1865; Thomas Lewin, *The Invasion of Britain by Julius Cæsar*, 1862; Cardwell, "Remarks on Julius Cæsar's Invasion of Britain," in *Archæologia Cantiana*, vol. iii.; Captain Becher, "Cæsar's Invasions of Britain: Nautical Conclusions on the place of his departure from Gaul, etc.," in *Nautical Magazine*, 1862; papers by F. de Saulcy and General Creuly in the *Revue Archéologique*, 1860 and 1863; E. de Saulcy, "Les Expéditions de César en Grande-Bretagne," in *Campagnes de César*, vol. i., 1862; Abbé Haigneré, *Étude sur le portus Itius de Jules César*, 1862; Von Göler, *Cäsar's gallischer Krieg in den Jahren 58 bis 53 v. Chr.*, 1858; Id., *Cäsar's gallischer Krieg im Jahre 51 v. Chr.*, 1860; H. L'empereur, "L'ancienne voie romaine d'Épéhy," in *L'Institut*, 1864; and A. Wauter's brochure, *Wissant l'ancien Portus Iccius*, Brussels, 1879.

ITURBIDE, or Yturbide, Augustin de (1783-1824), emperor of Mexico from May, 1822, to March, 1823, was born September 27, 1783, at Valladolid, now Morelia, in Mexico, where his father, an Old Spaniard from Pampeluna, had settled with his creole wife. After enjoying a better education than was then usual in Mexico, Iturbide entered the military service, and in 1810 held the post of lieutenant in the provincial regiment of his native city. In that year the insurrection under Hidalgo broke out, and Iturbide, more from policy, it would seem, than from principle, served in the royal army. Possessed of splendid courage and brilliant military talents, which fitted him especially for guerilla warfare, the young creole did signal service, and rapidly rose in military rank. In December, 1813, Colonel Iturbide, along with General Llano, dealt a crushing blow to the revolt by defeating Morelos, the successor of Hidalgo, in the battle of Valladolid; and the former followed it up by another decisive victory at Puruaran in January, 1814. Next year Don Augustin was appointed to the command of the army of the north and to the governorship of the provinces of Valladolid and Guanajuato, but in 1816 grave charges of extortion and violence were brought against him, which led to his recall. Although the general was acquitted, or at least although the inquiry was dropped, he did not resume his commands, but retired into private life for four years, which, we are told, he spent in a rigid course of penance for his former excesses. In 1820 Apodaca, viceroy of Mexico, received instructions from the Spanish cortes to proclaim the constitution promulgated in Spain in 1812, but, although obliged at first to submit to an order by which his power was much curtailed, he secretly cherished the design of reviving the absolute power for Ferdinand VII. in Mexico. Under pretext of putting down the lingering remains of revolt, he levied troops, and, placing Iturbide at their head, instructed him to proclaim the absolute power of the king. Four years of reflection, however, had modified the general's views, and now, led both by personal ambition and by patriotic regard for his country, Iturbide resolved to espouse the cause of national independence. His subsequent proceedings—how he issued the *Plan of Iguala*, on February 24, 1821, how by the refusal of the Spanish cortes to ratify the treaty of Cordova, which he had signed with O'Donoju, he was transformed from a mere champion of monarchy into a candidate for the crown, and how, hailed by the soldiers as emperor Augustin I. on May 18, 1822, he was compelled within ten months by his arrogant neglect of constitutional restraints, to tender his abdication to a congress which he had forcibly dissolved—will be found detailed under Mexico. Although the congress refused to accept his abdication on the ground that to do so would be to recognize the validity of his election, it permitted the ex-emperor to retire to Leghorn in Italy, while in consideration of his services in 1820 a yearly pension of £5000 was conferred upon him. But Iturbide resolved to make one more bid for power; and in 1824, passing from Leghorn to London he published a *Statement*, and on May 11th set sail for Mexico. The congress immediately issued an act of outlawry against him, forbidding him to set foot on Mexican soil on pain of death. Ignorant of this, the ex-emperor landed in disguise at Soto la Marina on July 14th. He was almost immediately recognized and arrested, and on July 19, 1824, was shot at Padilla, by order of the state of Tamaulipas, without being permitted an appeal to the general congress. Don Augustin de Iturbide is described by his contemporaries as being of handsome figure and ingratiating manner. His brilliant courage and wonderful success made him the idol of his soldiers, though towards his prisoners he displayed the most cold-blooded cruelty, boasting in one of his despatches of having honored Good Friday by shooting three hundred excommunicated wretches. Though described as amiable in his private life, he seems in his public career to have been ambitious and unscrupulous, and by his haughty Spanish temper, impatient of all resistance or control, to have forfeited the opportunity of founding a secure imperial dynasty. His son Augustin was chosen by the ill-fated emperor Maximilian as his successor.

See *Statement of some of the principal events in the public life of Augustin de Iturbide*, written by himself, English translation, 1824.

ITZEHOE, one of the busiest commercial towns of northern Germany, is situated on the Stör, a navigable tributary of the Elbe, in the circle of Steinburg of the Prussian province of Schleswig-Holstein, 32 miles northwest of Hamburg and 15 miles north of Glückstadt. As chief town of the circle, it is the seat of the usual local courts and of a head custom-house. The church of St Lawrence, dating from the 12th century, and the building in which the Holstein estates formerly met, are noteworthy. The town has a convent founded in 1256, a high school, a hospital, and other benevolent institutions. The sugar-refinery, which employs some 500 hands, is the largest in Germany. Iron-founding, shipbuilding, and wool-spinning are also carried on, and the manufactures include machinery, tobacco, fishing-nets, chiccory, soap, cement, beer, and other articles. Fishing employs some of the inhabitants, and the markets for cattle and horses are important. A considerable trade is carried on in agricultural products and wood, chiefly with Hamburg and Altona.

Including the garrison, the population in 1875 was 9776.

Itzehoe is the oldest town in Holstein. Its nucleus was a castle built to restrain the Danes in 809 by Egbert, one of Charlemagne's counts. The community which sprang up around it was diversely called Esseveldoburg, Eselsfleth, and Ezeho. In 1201 the town was destroyed, but it was restored in 1224. To the new town the Lübeck rights were granted by Adolphus IV. in 1238, and to the old town in 1303. During the Thirty Years' War Itzehoe was twice destroyed by the Swedes, in 1644 and 1657, but was rebuilt on each occasion. It passed to Prussia in 1867, with the duchy of Schleswig-Holstein.

IVAN (or JOANN, *i. e.*, JOHN) I., grand-duke of Moscow from 1328 to 1340, was surnamed Kalita in allusion to the "purse" which he always carried at his girdle. Some have imagined that it contained alms for distribution; others with greater probability look upon it as characteristic of the miserly habits of the prince. The great importance of Ivan in Russian history is that he was the consolidator of the power of Moscow, the nucleus out of which the empire was to be formed at a future period. By treachery he procured from Uzbek, the Tatar Khan, the ruin of his rival the prince of Tver, and by craft and bribery made many additions to his territory. He also induced the metropolitan to reside at Moscow, which brought dignity and influence to the city.

IVAN II., grand-duke from 1353 to 1359, son of Ivan I., succeeded on the death of his brother Simon Gordi, or the Proud. He appears to have been a kindly man, but, in so far as his short reign had any effect, it weakened the principality of Moscow.

IVAN III., surnamed the Great, grand-duke from 1462 to 1505, forms one of the most important figures in the annals of Russia, for to him is due the consolidation of the autocracy. His long reign of forty-three years was very beneficial to his country. He was a skilful diplomatist, and often brought about by intrigue what others could only effect by force of arms. Thus he reduced to submission the haughty republic of Novgorod, and united to the principality of Moscow those of Tver, Rostoff, and Yaroslavl; he also took Kazan in 1487, but it was not definitively incorporated with Moscow till the reign of Ivan IV. He reconquered the territory as far as the river Sozh, which had fallen under the dominion of the Lithuanians. In 1472 he married Sophia, niece of Constantine Palæologus. In consequence of this union Ivan considered himself the heir of the Byzantine emperors, and adopted the two-headed eagle for his arms. Embassies were sent to foreign powers. Italian architects were invited into Russia, and many learned Greek monks found refuge there from the yoke of the Turks.

IVAN IV., surnamed the terrible (*Grozni*), the first czar of Russia, was a mere child at the time of the death of his father Vasili in 1533. His reign may be divided into three periods:—(1) his minority, under the regency of his stepmother Helen Glinska; (2) from his attaining his majority till the death of his amiable wife Anastasia Romanova, during which time he was a bold and vigorous ruler, and careful of the happiness of his subjects; and (3) from her death till the conclusion of his reign in 1584, the period signalized by those atrocities which have earned for Ivan such an unenviable reputation. He was the first Russian sovereign who took the title of Czar, a Slavonic form of Cæsar. In 1552 he annexed Kazan, and Astrakhan two years later. In many points of his character Ivan resembles Louis XI., especially in his statecraft and superstition; indeed, just as France owed her aggrandizement to some of her most cruel sovereigns, so in Russia the greatest tyrants have been the consolidators of the empire. In the time of Ivan a printing press was set up at Moscow, and the first book published (in 1564) was an *Apostol*—a name given to a collection of the Acts of the Apostles and the apostolic epistles; but persecution was soon directed against the printers, who, from the jealousy of those who gained their livelihood by copying religious books, were compelled to fly from Russia, and were protected by Sigismund II. of Poland. They afterwards printed the whole Bible at Ostrog in Volhynia in 1581. In the British Museum is a copy of this book, which formerly belonged to the terrible Ivan. Sir Jerome Horsey, the English ambassador, has written on the fly-leaf, "this Bibell in the Slavonian tonge had owt of the emperor's librari." Siberia was also annexed in this reign through the enterprise of the Cossack Yermak, and the English first opened up commercial intercourse with the country by means of the expedition of Sir Hugh Willoughby and Richard Chancellor in 1553. The English for a long time enjoyed the monopoly of the Russian trade, and it is to some of them that the Russians are indebted for interesting accounts of their land, especially to Dr. Giles Fletcher, uncle of the dramatist, whose *Russe Common-Wealth* (London, 1591) is a mine of valuable information. The atrocities committed by Ivan at Novgorod in 1569, and at Pskov soon afterwards, are well known. It is from foreigners, such as Horsey, that we get minute accounts of his many cruelties. In the British Museum are preserved some of his letters to Queen Elizabeth, of whom he requested that an English wife should be chosen for him and sent to Russia. A Lady Mary Hastings, daughter of the earl of Huntingdon, was selected and introduced to the Russian ambassador Pisemski, but when the time drew near for her departure she entreated her father with tears not to send her to such a husband. The miserable tyrant expired in 1584, from grief for his son, whom he had killed in a fit of passion three years before. Like Louis XI., he loved to surround himself with quacks and magicians, some of whom, according to Horsey, prophesied the day of his death. The latter has left us the following curious notice of him:—

> "Thus much to conclude with this emperor Ivan Vasiliwich. He was a goodlie man of person and presence, well favored, high forehead, shrill voice, a right Sithian, full of readie wisdom, cruell, bloudye, merciless; his own experience mannaged by direction both his state and commonwealth affares; was sumptuously intomed in Michell Archangel church, where he, though garded daye and night, remaines a fearfull spectacle to the memory of such as pass by or heer his name spoken of, [who] are contented to cross and bless themselves from his resurrection againe."

IVAN V., czar from 1682 to 1696, was the son of Alexis by his first wife Maria Miloslavskaia. He was infirm both in mind and body. The Narîshkins, to which family the widow of Alexis (his second wife) belonged, were anxious that Peter, the next brother, should succeed, but Sophia, the ambitious daughter of Alexis by his first wife, wished Ivan to rule, so that she might govern in his name. She was ultimately forced, however, into the Devichi monastery, and Ivan reigned conjointly with his brother, the government being really in the hands of Peter assisted by his mother, the Narîshkins, Dolgoroukis, and Boris Golîtzin.

IVAN VI., czar in 1740–41, was son of Anthony Ulrich of Brunswick by his marriage with Anne, granddaughter of Ivan V. The reign of this unfortunate young man lasted but a year, under the regencies of his mother and Biren. Owing to the success of the revolution under Elizabeth, daughter of Peter the Great, he was confined as a prisoner in Schlüsselburg, and Anthony and Anne with their other children were banished to Kholmogorî in the government of Archangel. By long detention in the fortress Ivan became, it is said, half-witted. In the year 1764 a certain Lieutenant Mirovich attempted to deliver him from captivity and proclaim him emperor. Ivan, however, was slain in the skirmish that ensued, and Mirovich was afterwards publicly executed. According to some, he had been urged to the act by Catherine, who wanted an excuse for putting Ivan to death.

For the Ivans see Soloviev, *Istoriya Rossii*, 29 vols.; Oustrialov, *Rousskaya Istoriya*, 2 vols.; W. R. S. Ralston, *Early Russian History*; Rambaud, *Histoire de la Russie*.

IVANOVO, or **Ivanovo-Voznesensk**, the "Manchester of Russia," a town in the government of Vladimir, 20 miles north-west of Shua, near the river Uvod, and on the road from Shua to Nerakhta. It consists, as the full name implies, of what were originally two villages—Ivanovo, which existed at least as early as the 16th century, and Voznesensk, of much more recent date—united into a town in 1861. Of best note among the public buildings are the cathedral of the Elevation of the Cross, and the church of the Intercession of the Virgin, formerly associated with an important monastery founded in 1579 and abandoned in 1754. One of the colleges of the town contains a public library. The industrial history of Ivanovo begins with the 18th century. Linen-weaving was introduced in 1751, and in 1776 the manufacture of chintzes was brought from Schlüsselburg by some natives of the village. By 1850 the worth of the chintzes amounted to 6,680,875 roubles, and 10,000 workmen were employed in the manufacture of coarse calico. The reports of 1879 show 35 calico-print works, a wool-spinning factory, 6 cotton-weaving factories, 8 bleachworks, 6 ironworks, 3 chemical works, and several minor establishments. The workmen number about 15,000 or 20,000. The cotton factories produce to the annual value of 25,000,000 to 30,000,000 roubles; the iron works manufacture 110,000 poods (1770 tons) of iron, and there is a considerable turn out of boilers and factory machinery. Bast mats are made to the value of 15,000 roubles.

IVORY is essentially equivalent to dentine, that hard substance, not wholly unlike bone, of which most teeth principally consist. By usage, however, its application has become almost restricted to the dentine of those teeth which are large enough to be available for industrial purposes, viz., the tusks of the elephant, the hippopotamus, the walrus, the narwhal, and the sperm whales.

Ivory consists of an organic matrix or basis substance (which by prolonged boiling is converted into gelatin), permeated by an immense number of exceedingly fine canals. The matrix is richly impregnated with calcareous salts, which are probably held in some loose form of chemical combination with it, and is of such consistence that it retains its form after removal of the salts by an acid solvent. The canals start from the axial pulp cavity, and run in a direction generally outwards towards the periphery of the tusk; in the elephant they are of exceptional fineness, being only about $\frac{1}{1500}$ of an inch in diameter, and are placed very closely, being separated by intervals not much greater than their own diameter. To the regularity with which the tubes are disposed, and to their small size and frequent curvature, ivory owes its fineness of grain, and probably also its almost perfect elasticity; whilst to the peculiarities of their curvatures it owes that very characteristic pattern of curved decussating lines, like engine turning, which is seen where the surface is a section transverse to the tusk. For, though it is broadly true that the tubes in elephant ivory run from the axis of the tusk to its periphery, they do not run straight, but make a succession of strong bends at regular intervals, and as the light is differently refracted by the basis substance and by the tubes according to the direction they are pursuing, this peculiarity of their course results in producing that pattern found in the dentine of *Proboscidea* only. Ivory differs from bone in its finer structure and greater elasticity, and in the absence of those larger canals which convey bloodvessels through the substance of bone, and appear upon it as specks or as stripes, according as it is cut transversely or longitudinally. When a transverse section of a tusk cut at a distance from the growing pulp is examined, its middle is seen to be occupied by a darkish spot of obviously different structure; this is the last remains of the pulp, rudely calcified. The outer border of the section consists of a thick layer of cementum, with which the whole tusk is coated, and the rest is ivory, showing the characteristic engine-turning pattern, and, in addition to this, numerous circular lines, concentric with the central spot. These "contour" lines are due to the occurrence of a large number of minute irregular spaces, found in all dentine, but especially abundant and imposed with a greater regularity in ivory; they are known as interglobular spaces, from the form of their boundaries when seen under a moderate magnifying power. In the areas occupied by these spaces there is a smaller proportion of lime salts and more organic matter; consequently the ivory is here less dense and more liable to decomposition, and fossil tusks, as well as the less perfectly preserved of mammoth tusks, are frequently found to have broken up into a number of superposed cones, and in transverse section to present many concentric detached rings of ivory more or less friable. See Plate VII.

Arguing from the analogy of other dentine, it cannot be doubted that the minute tubes and the interglobular spaces are not empty in living ivory, but that they contain protoplasmic substance, though how far this may have perished or altered in that portion of the tusk which is extruded and far distant from the growing pulp can only be determined by observations at present wanting. According to Von Bibra's analyses, ivory contains as much as from 40 to 43 per cent. of organic matter, whereas human dentine contains only about 25 per cent.; of fat it contains from ·24 to ·34 per cent. It differs from other dentines chiefly in its richness in organic constituents, in the fineness of its tubes, in their peculiarly curved course, and in the abundance of interglobular spaces arranged in "contour" lines. The tusks of the elephant are a pair of upper incisor teeth, which may attain to an enormous development. The largest teeth were possessed by the extinct mammoths, of which tusks have been found in Siberia 12 feet and more in length, and weighing 200 ℔ each. Holzapffel mentions one of very fine quality, that was cut up into piano keys in England, which weighed 186 ℔. Among recent elephants the African species possess the largest tusks, these attaining to a length of 9 or 10 feet and a weight of 160 ℔ each, whilst the tusk of an Indian elephant which measured 8 feet in length and weighed 90 ℔ has been placed on record as exceptionally large. A pair of African tusks at the London exhibition of 1851 weighed 325 ℔, and measured 8 feet 6 inches in length and 22 inches in circumference; but authorities acquainted with the African ivory districts give 20 to 50 ℔ as the average weight of tusks. In Africa both males and females are furnished with large tusks; but in the Indian species a sexual difference exists, the tusks of the female projecting only a few inches from the gums, while even of the males by no means all are "tuskers." Sanderson says that 10 per cent. of Indian male elephants have very small tusks, while in Ceylon only one in three hundred of the males is powerfully armed. The peculiarity is not always transmitted, tuskless sires ("mucknas") breeding "tuskers," and *vice versa*. The importance of tusks as giving an advantage in combat to their possessors is sufficiently indicated by the dread of a "tusker" shown by other elephants less favored. Tusks are often broken by fighting, and always show marks of considerable wear, while even captive elephants, with their shortened tusks, make great use of them for a variety of purposes; for example, an elephant will, when set to pull at a rope, take it between his molar teeth and pass it over one of his tusks to get a good purchase. Nothing but an extremely strong and elastic material such as ivory is could withstand the strain to which it is constantly exposed.

Captive elephants have their tusks shortened, and the ends bound with metal to prevent their splitting; and,

as the tusk is continually growing by the conversion of fresh portions of vascular pulp into ivory, the operation has to be repeated. When this is done at intervals of ten years, the segment cut off is valuable, and is sold as ivory; some prefer, however, to cut the tusks much more frequently. In a young elephant the vascular pulp extends beyond the portion of the tusk implanted in the jaw, while in the older animal it does not reach so far; its probable extent has to be borne in mind in shortening the tusk, as if it be encroached upon much suffering is entailed on the animal. Yet the vascular formative pulp of an elephant's tooth is singularly tolerant of injury without having its function of ivory formation destroyed, and hence it happens that foreign bodies which have got access into the pulp chamber become solidly enclosed in ivory. The growing end of the tusk is widely open, and its edges are not much thicker than paper; the cavity which contains the pulp is of conical form, tapering to a point, which is situated at a distance down the tusk, varying, as has been before stated, with the age of the animal. The tusk grows by the conversion of successive portions of the surface of the conical mass of pulp into ivory, whilst fresh pulp is added at the flat base or open end of the tusk. The tusks are deeply implanted in curved bony sockets, which run nearly vertically upwards, so that the open growing ends of the tusks are brought up to about the level of the eyes. Hence it is not a rare occurrence for a sportsman's bullet, intended to pierce the elephant's brain, to penetrate the tusk near to its growing end, where the walls of the pulp cavity are quite thin, and to lodge in the "nerve" of its tooth. Indeed sportsmen remark that the forehead shot is less fatal to African than to Asiatic elephants, owing to the size and position of their tusks. The amount of disturbance produced by a bullet in the nerve is variable; sometimes the conversion of pulp into ivory goes on with but little interruption, so that the bullet comes to be imbedded in ivory, which fits closely up against it, instead of in pulp as it was at first. Generally the pulp immediately around it has been so disintegrated by its impact, or by subsequent inflammation, that it is incapable of conversion into normal ivory, and in its place there is a more or less irregular development of nodular secondary dentine. And sometimes there is a failure to produce even this less highly organized tissue in the immediate proximity of the bullet, which then ultimately comes to lie loose in an irregular cavity completely surrounded by secondary dentine. Of a similar nature is the so-called "abscess in ivory;" this was really an abscess in the formative pulp surrounded by a limiting membrane; as the conversion of the pulp into ivory went on, calcification passed all around the abscess and enclosed this, pus, membrane, and all, in solid ivory; and there it is discovered by the ivory cutter as an empty hole lined by a thin dried skin, the old abscess sac.

African natives sometimes spear elephants to death when they have been surrounded by an extemporized barrier of twisted creepers, and for this purpose some of them climb into trees; they also set traps made of a very heavy piece of wood shod with an iron spearhead, arranged to fall upon the elephant as he passes along a track beneath (Du Chaillu); elsewhere lances of extreme length are used in the same way. The open base of the tooth, containing the formative pulp, looking directly upwards, a spear from above intended to fall upon the head or to "pith" the animal might easily enter it, and break away, leaving the point in the tooth pulp. In a specimen now in the museum of the Odontological Society, London, such a spear head remained without stopping the further growth of the tusk, and came to be solidly enclosed in ivory and secondary dentine, although it measures no less than 7½ by 1½ inches. Not a trace of its presence was discernible upon the exterior of the tusk, and it was only discovered when the tooth was sawn up. This specimen is not unique, there being said to be another, which has been turned into a cup with the imbedded spear head as its stem; and there is a specimen of a javelin head firmly built in by ivory in the museum of the Royal College of Surgeons. But that an elephant is not wholly indifferent to a large foreign body in the nerve of his tooth is proved by the fact that a notoriously fierce and dangerous "rogue" elephant in Ceylon was found when killed to have been suffering from inflammation and suppuration consequent upon the presence of a bullet in the pulp of a tooth; the supposed madness of the famed elephant of Exeter Change was also found to have been due to the pain of a diseased tooth. A common result of injury to a growing tusk is the conversion of a portion of the pulp into irregular globular masses of secondary dentine,—sometimes enclosed solidly in the midst of normal ivory, sometimes forming loose masses as big as hen eggs in the pulp cavity, and sometimes stalagmite-like appendages to its walls. Of course such deviations from normal structure seriously injure its value for industrial purposes, and they are specially apt to occur in domesticated animals whose tusks are being repeatedly shortened, the cut not being invariably made at a sufficient distance from the apex of the living pulp. But under no circumstances is the ivory from domesticated elephants so highly esteemed as that from the wild animal.

The large balls of secondary dentine appear on section as a conglomerate of spherical masses bound together by softer and looser-textured materials; they are sometimes beautiful, but cannot be made much use of. Small spots of globular dentine sometimes occur in the midst of normal ivory, for which no cause can be detected. Malformed tusks are far from rare; the College of Surgeons possesses one about 2 feet in length, the base of which is an irregular mass of osteodentine nearly as large as a man's head. Spiral tusks are also met with, and are almost always the result of some disease of one side of the pulp, leading to a slower growth on the one side than on the other. Much of the ivory of such tusks will be faulty; they should not be purchased except as curiosities.

The Board of Trade returns for 1879 give as the total weight of ivory imported into England during the year 9414 cwts., of the value of £406,927;[1] but nearly half this quantity appears again amongst the exports. By far the larger portion of the ivory is entered as coming from African ports, and less than one-fourth from India, while from this fourth a further reduction must be made in estimating the quantity produced by the country, as a considerable weight of African ivory from Zanzibar, etc., is shipped from Bombay. About 1080 cwts. is entered as "from other countries."[2]

The best ivory is the African, and the first quality of that comes from near the equator; much is brought down by natives by land from the interior, whilst in other districts expeditions are organized by Europeans to go into the interior, and collect the stores gathered by native tribes; 20,000 ℔, valued at Khartoum at £4000, would be considered a good result for a season's expedition with one hundred and fifty men. The price of ivory varies much in different districts, being generally higher on the west than on the east coast; the transaction is generally one of barter, and the price therefore difficult to estimate. The tusks are sold by weight, and stones and iron are sometimes thrust down into the hollow pulp cavity to increase the weight, so that dealers generally feel down the hollow with an iron rod to detect foreign matter. The value of the

[1] The imports vary considerably from year to year. In 1875 they amounted to 16,258 cwt., valued at £772,371.

[2] Westendarp states that Africa exports on an average about 15,550 cwt. a year, which would be worth from £600,000 to £750,000, and that the ivory trade is steadily growing, especially on the West Coast. He estimates that in the west not less than 51,000 elephants are killed annually, and anticipates their becoming less numerous. Although the export from India only reached in 1875–7 from 9,000 to 17,000 ℔ a year, a considerably larger quantity of ivory is used in India for arm rings, &c., and for decorative and ornamental purposes. China also deals in ivory, exporting most of it after it has been carved.

ivory depends upon the size of the tusks; those below 6 or 7 ℔ weight are not worth more than half the price per ℔ of really fine tusks. Something depends on the care bestowed upon the tusks, which are sometimes roughly treated, while others are waxed and carefully wrapped up for protection. The African ivory trade is an ancient one, and in mediæval times Marco Polo speaks of the traffic in ivory at Zanzibar as being astonishing in its amount.

The tusks of the mammoth from northern Siberia are said to furnish almost the whole of the ivory used by Russian ivory workers. They are found in most extraordinary abundance, and it is said that from the time of Dr. Breyne's quaint paper "Behemoth" in the *Philosophical Transactions* for 1737 till now there has been no intermission in the supply. They come principally from the neighborhood of the Lena and other great rivers discharging themselves into the Arctic Ocean, and are abundantly found in the Liakhoff Islands. Mammoth tusks are slenderer, much more curved, and in proportion to the size of the animal much larger than those of recent elephants. In Siberia at different times four mammoths have been found entire, their hair, skin, and even all their soft parts having been preserved without change in the ice for countless years. Just as in some few cases all the most perishable soft parts were preserved, so in a vastly greater number the less perishable ivory was kept without change by the low temperature and exclusion of air; thus when in the summer the ice tears down portions of river banks, or floods break up frozen morasses, the tusks are brought to light. Some are in the most beautiful preservation, like recent ivory; others having been exposed before, in previous summers, their organic constituents have partly perished, and they are inclined to become broken up along the lines of interglobular space into concentric rings, or may have become so disintegrated that a fragment may be used like chalk to write with.

In England this ivory is not very highly esteemed, being considered too dry and brittle for elaborate work, and to be very liable to turn yellow. Most ivory workers strenuously deny ever using them, but, though more rarely than in former years, mammoth tusks are occasionally imported. Within the last few years an exceptionally large tusk in splendid condition was offered for sale to the Oxford University Museum at a price of a £100, but was not purchased. In 1872, 1630 very fine tusks were brought to England; and in 1873, 1140 tusks weighing from 140 to 160 ℔ each were imported. The best were sold at a very good price, but proved less available, even for such purposes as cutting into knife handles, than was expected, and although smaller importations arrive from time to time they can hardly be considered as a regular article of commerce, and are difficult of sale; some have been very recently sold at a price so low as ten shillings a cwt. Westendarp personally investigated the Siberian ivory trading districts, and returned with no favorable impression. He found that about 14 per cent. of the teeth were good, 17 per cent. could be made some use of, 54 were quite bad, and 15 wholly useless. The ivory looks better outside than it really is, and, as only about 30 per cent. is usable, it does not pay well for transport. He thought it not worth more than 1s. 6d. a pound.

The finest quality of ivory from equatorial Africa is closer in the grain, and has less tendency to become yellow by exposure than Indian ivory. When first cut it is semi-transparent and of a warm color; in this state it is called "green" ivory, and as it dries it becomes much lighter in color and more opaque. This is supposed to be the result of the drying out of the "oil;" but ivory contains less than one-half per cent. of fatty material, and that which dries out is water, not oil. During this drying process the ivory shrinks considerably, so that it is necessary to season it like wood when such things as box lids, which need to fit, are to be made from it. The tusks shrink much more in their width than in their length, which will be readily understood when the many concentric rings of interglobular spaces, containing soft material, which dries up and leaves them empty, are remembered. It is on account of this peculiarity of structure that billiard balls are turned from tusks not greatly exceeding them in diameter, for by the selection of such tusks the ivory on the opposite sides of the ball will correspond in density and in structure, and the shrinkage will be uniform about its centre. They are usually turned roughly into shape, kept for some time in a warm room to shrink, and then turned true. The thin plates cut for piano keys are dried and shrunk at once by being baked for a time in an oven, but after being dried they are still subject to changes in bulk in a moist atmosphere.

It is not always possible to judge of the quality of ivory before the tusk is cut up. The exterior, or cementum, should be smooth and polished; it is often of a deep coffee color in the best tusks, and it should not show any large cracks. But the most profound disorganization of the ivory may exist inside an exterior which promises well, or it may be badly cracked from unequal shrinkage in drying without cracks being noticeable on its exterior. About half of the length of an average-sized tusk is implanted; this will be hollow, and in a young animal the hollow will extend beyond the implanted portion; the extruded part, recognizable by the deeper color of its cementum, is solid, and is circular or oval in section. Great care is taken by ivory cutters to cut up the tusk to the greatest advantage, its high price necessitating the strictest economy in its use. Veneers of large size have been cut by a reciprocating saw cutting a spiral shaving round the tusk, one having been thus produced 40 feet in length by 12 inches in width; but they are not of much practical value, save as an example of what is possible. With age ivory turns yellow, and various receipts are given for restoring its whiteness; but they mainly depend upon mere removal of the outer surface, and no satisfactory method of bleaching it is known; it preserves its color best when exposed to light. Considering the high percentage of organic matter which it contains, it is surprisingly durable. In some of the ivories brought by Mr. Layard from Nineveh, in which the organic constituent had partially perished, leaving them very friable, its place was supplied by boiling them in a solution of gelatin, a process suggested by Professor Owen as the likeliest means of restoring to them something like what they had lost during the lapse of time by exposure. It is possible that by some such treatment the perished ivory of the mammoth may be rendered useful for some purposes. The existence of chryselephantine statues of Phidias, and of flat plaques of ivory larger than could be cut from any known tusk, renders it probable that ancient workers possessed some method of bending it; and receipts have come down from the 12th century for softening it so as to alter its form. But these, which depend upon its partial decalcification, have not been found to yield the excellent results claimed for them, and the larger plaques in question present no appearance of having been submitted to any such process. Moreover, Westendarp states that from a tusk weighing 200 ℔. the largest plaques he knows of could have been cut. Ivory can be made flexible by submitting it to the solvent action of phosphoric acid; when washed and dried it becomes hard, and when moistened again it resumes its flexibility; but this is at the sacrifice of many of its properties.

Ivory takes a variety of dyes well, without interfering with the polish of its surface; the actual matrix is stained, and the color is not merely due to the penetration of pigment into the open dentinal tubes.

The great canine teeth of the hippopotamus furnish an ivory which is harder and whiter than that of the elephant, and less prone to turn yellow; these differences are probably due to its containing a smaller percentage of organic matter. It also lacks the engine-turning pattern of elephant ivory. The tusk of the hippopotamus is a tooth of persistent growth, strongly curved into a segment of a circle, and solid in the greater part of its length. It is thickly coated with enamel on its exterior surface, and is trihedral. On transverse section the remains of the pulp cavity are seen as a line or fissure in the middle, and occasionally there is a nodule of secondary dentine in it. The ivory is not quite homogeneous; for the back of the tooth, which is not covered with enamel and in use wears down the fastest so as to keep a sharp edge to the tusk, is markedly softer than the rest of the tooth. No large piece can be obtained from a hippopotamus tusk, and the incisors and the upper canines yield even smaller pieces than the lower canines. Thirty years ago there was a considerable demand for them for dentists' use, and at that time a fine tusk of 5 ℔ weight was worth from five to seven guineas, but the price is now much lower, and comparatively few are imported.

Amongst the northern nations the tusks of the walrus have long been used as a source of ivory. The great upper canines consist of a body of dentine invested with cementum; they are oval in section, solid, and their axis is made up of secondary dentine, which is far larger in amount than in the hippopotamus, and makes up a considerable part of the whole tooth. This is very nodular in appearance when cut and polished, but is of dense and tolerably uniform consistence.

The spirally twisted tusk of the narwhal, the teeth of the sperm whales, the ear bones of whales, and the molar teeth of the elephant, are also all made use of as sources of ivory, though they are far less valuable than the larger tusks. For the subject of carvings in ivory, see CARVING, vol. v., p. 146. The earliest piece of ivory work known is a rude incised drawing of a mammoth upon a fragment of mammoth tusk, which must have been executed by a contemporary of the animal. Numerous references to ivory occur in the Old Testament, which show that it was regarded as of great value. It seems to have been used for the decoration of the temple, and it is often mentioned amongst the presents brought to kings, who employed it for purposes of regal state. Some, however, of the references would seem more strictly applicable to wood than to ivory.

The Nineveh ivories in the British Museum are of very great antiquity, a probable date of 900 B.C. having been assigned to them; yet many of them are in good preservation, and others have been tolerably well restored by boiling in gelatin. All exhibit considerable artistic merit and mastery over the material, whilst some reach a very high degree of excellence alike in design and execution. Competent judges declare that, underlying the obviously Egyptian character of the work, there are differences sufficient to lead to the inference that the ivories were not executed in that country. Some of them consist of thin plaques on which figures were delineated by means of incised lines; some were carved in low, and others in high relief; whilst there are many examples of detached heads, and even entire figures, carved in close imitation of nature (see Plate VII.). Traces of gilding remain on many of them, and they were often further enriched by being inlaid with fragments of lapis lazuli, or of a colored glass in apparent imitation of this; the eyes of the larger heads were generally rendered conspicuous by this means. In one of the panels figured, the border of the dresses, the thrones on which the figures are seated, the ornaments above the cartouche, and the symbols upon the cartouche itself were thus inlaid with color. The largest object is a carved staff, perhaps a sceptre; amongst the smaller pieces are heads of animals and entire animals, griffins, human heads, crossed and clasped hands, rings, etc. Like the ivory carvers of later times, these early workers seemed to have studied economy of their material; thus a beautiful carving in high relief of two griffins standing upon papyrus flowers has been carved on the interior of a segment of a large tusk, the natural curvature of which it follows. The tendency of ivory to decompose into concentric layers parallel with its exterior has been already noticed, and Mr. Layard himself speaks of the trouble he experienced owing to the flaking of the pieces he discovered; it is by the separation along the contour lines that many ancient ivories have been spoiled. Besides those discovered at Nineveh, some other ivories of great antiquity exist; and ivory workers are mentioned as a distinct class of artificers at the commencement of the Christian era. Many writing tablets of ivory, with raised rims inside, where wax was spread over their surface, have come down to us; these were often made to fold together, and the exterior richly ornamented with carvings. It was the custom for newly appointed consuls under the empire to send these plaques to persons of importance, and the covers sometimes have upon them representations of the consul in his robes of office.

One of the most beautiful of ancient ivories is the Roman 3d century plaque purchased by the South Kensington Museum for £400 (see Plate VII.). It forms one half of a diptych, and measures 11¾ by 4¾ inches. The other half is in the Hôtel Cluny.

From these times down to the present day there has been a constant succession of ivory workers, though in mediæval times artists of higher ability were to be found than any who will now devote themselves to such work. A large proportion of the carvings deal with sacred subjects: one of the most beautiful is a Pieta, the virgin holding the dead body of Christ in her lap (see Plate VII.); this was executed about the 14th century. Illustrations of old romances were frequently made use of to decorate mirror cases, boxes, etc., and elaborately carved chessmen of walrus ivory referable to an ancient period have been found in the island of Lewis. Schliemann, in his excavation at the supposed site of Troy, found many useful articles made of ivory,—pins, buckles, etc.,—but no carvings, even of rude character.

Among the chryselephantine statues of ancient Greece executed by Phidias, Praxiteles, and others, one of Minerva in the Parthenon was 40 feet in height, and was constructed of ivory and gold; others are mentioned as made of wood, with face, hands, and feet of ivory. Yet in some cases it is expressly said that the statue was entirely of ivory, special exception being made of a portion of the dress which was not. Among the Nineveh ivories are some which apparently belonged to figures partly wood and partly ivory, but these were of no great size; the wood employed seems to have been ebony.

In former times ivory was frequently used for the manufacture of artificial teeth; but this has become a thing of the past, ivory having been superseded by more durable and more manageable materials. Its use for this purpose is quite ancient; thus Martial contemptuously speaks of a lady of his own time "emptis ossibus indicoque cornu" as having but a poor chance of passing them off as her own teeth. For the use of the dentist elephant ivory was less suitable than that of the hippopotamus or the walrus; of these two the former was generally preferred. The enamel was chipped off with a chisel, or made to fly off by a judicious application of a blowpipe flame, and the tusk was so cut that the plate might consist as far as possible of the hardest part of the dentine which had formed the front of the tooth. This, carved up to fit the mouth accurately, formed a supporting plate which commonly carried in the front actual human teeth secured by pins, though sometimes the teeth were formed of ivory carved in imitation of teeth, and at the back blocks of hippopotamus or walrus ivory were added for the purposes of mastication. They were called "bone pieces," though there was really no bone used in their construction; their durability was in no case great, though it varied in the mouths of different persons, and a plate had to be ultimately discarded on account of the ivory getting discolored, softened, and offensive. For dental purposes walrus ivory was more durable than hippopotamus, but its color was not so suitable, nor was it so hard. Some specimens of native Indian dental work in ivory exist, but these have probably been copied from plates worn by Europeans.

The principal demand for ivory, beyond the purposes already alluded to, arises in connection with the cutlery trade, very large quantities being used for the handles of pocket and table knives. It is also extensively employed for the handles of walking sticks and umbrellas, for combs, paper knives, and ladies' fans, and for measuring rules and mathematical scales. Further, it is in considerable demand for the manufacture of chess and draughts men, for statuettes, relievo plaques, caskets, and many minor objects of furniture, decoration, and ornament, and for the purposes of inlaying. Dieppe is now a principal centre of the European ivory manufacture.

But it is in the East, and especially in China, that ivory is now most highly prized and most elaborately worked into decorative forms. No amount of patience and care appears to be considered excessive among the Chinese for the decorative working of ivory, as is obvious in the extremely minute and delicate workmanship in their lace-like carved open-work trays, while their carved nests of concentric ivory balls are still reckoned among the puzzles of industry. By the Japanese ivory is equally held in esteem, and is decoratively treated in their peculiar manner in the form of spill cases, medicine boxes, and the elaborately carved and ornamented nitsuké or large buttons. In India ivory is extensively used in the inlaid work of Bombay, etc., and for furniture decoration generally; and it is also cut into long slender filaments for making the tails of state chowries or fly-flappers, which, both handle and tail, are in many instances made of ivory.

All ivory dust, chips, and pieces unsuited for working are utilized by being converted into gelatin, which they may be made to yield by prolonged boiling, or by being calcined into ivory black. Confectioners are said to make use of ivory dust as a basis for soups, and it forms an excellent colorless size, employed for delicate purposes. When ivory is calcined in a close chamber, in which there is not enough oxygen to burn the carbon into carbonic acid, the organic matrix is burnt into carbon with which remain in the most intimate admixture the lime and magnesium salts which had previously hardened it. Strange to say, the calcined ivory retains its form and texture notwithstanding the destruction of the organic matrix, and specimens sometimes show the engine-turning markings on the cut surface with the utmost distinctness. It is an animal charcoal of great purity, and owes its delicacy and particular properties to the extremely fine division of the carbon particles. When ground up and mixed with appropriate media, it affords both to the oil and the water-color painter a most valuable black pigment; it is also used as an ingredient in the fine printing ink used for engravings and etchings.

Attempts have been made to manufacture an artificial ivory, but with no very satisfactory result. Billiard balls and other small objects have been manufactured of celluloid, a combination of gun cotton and camphor with ivory dust, which becomes plastic at a temperature of about 280°, and when cold is again quite hard and somewhat translucent. Plaster copies or reproductions of artistic ivories are prepared, under the name of fictile ivories, by casting in very fine plaster of Paris tinted with yellow ochre, and subsequently treating the surface with a mixture of wax and spermaceti or stearine. But it may fairly be said that for the purposes to which ivory is ordinarily applied no substitute approaches it either in beauty or in those other qualities which render it so agreeable and so satisfactory a material for the workman, whether carver, turner, or miniature painter.

IVORY, Vegetable. The plant yielding the vegetable ivory of commerce is known to botanists as *Phytelephas macrocarpa*, Ruiz and Pavon. It is a native of South America, occurring chiefly on the banks of the river Magdalena, Colombia, always found in damp localities, not only, however, on the lower coast region as in Darien, but also at a considerable elevation above the sea. It is mostly found in separate groves, not mixed with other trees or shrubs, and where travellers tell us even herbs are rarely met with, "the ground appearing as if it had been swept." The plant is severally known as the "Tagua" by the Indians on the banks of the Magdalena, as the "Anta" on the coast of Darien, and as the "Pullipunta" and "Homero" in Peru. It is a stemless or caulescent palm-like plant, the top of which is crowned with from twelve to twenty very long pinnatifid leaves. The plants are diœcious, the males forming higher, more erect, and robust trunks than the females. The male inflorescence is in the form of a simple fleshy cylindrical spadix covered with flowers; the female flowers are also in a single spadix, which, however, is shorter than in the male. The fruit consists of a conglomerated head composed of six or seven drupes, each containing from six to nine seeds, and the whole being enclosed in a walled woody covering forming altogether a globular head as large as that of a man. A single plant sometimes bears at the same time from six to eight of these large heads of fruit, each weighing from 20 to 25 lbs. In its very young state the seed contains a clear insipid fluid, which travellers take advantage of to allay thirst. As it gets older this fluid becomes milky and of a sweet taste, and it gradually continues to change both in taste and consistence until it becomes so hard as to make it valuable as a substitute for animal ivory. In their young and fresh state the fruits are eaten with avidity by bears, hogs, and other animals. The seeds, or nuts as they are usually called when fully ripe and hard, are used by the American Indians for making small ornamental articles and toys. They are imported into Britain in considerable quantities, frequently under the name of "Corozo" nuts, a name by which the fruits of some species of *Attalea* are known in Central America—their uses being chiefly for small articles of turnery. The question of the position of this plant in the vegetable kingdom is one upon which botanists have been much divided. The plant has at different times occupied the attention of such well-known botanical authorities as Ruiz and Pavon, who gave to it its scientific name of *Phytelephas macrocarpa*, and of Martius, Morren, Humboldt, Bonpland, Spruce, and others, by whom it has been considered respectively to be near to the *Palmeæ* or the *Pandaneæ*, or to belong to a separate and distinct order, the *Phytelephasieæ* of Brongniart. This order is now placed by Le Maout and Decaisne between *Palmeæ* and *Pandaneæ*, and *Phytelephas* is of course retained in it as the type,—one other genus only, that of *Wettinia*, being included.

IVORY, James (1765–1842), a Scottish mathematician, was born in Dundee in 1765. In 1779 he entered the university of St. Andrews, where after four years study he graduated M.A., distinguishing himself especially as an ardent and successful student of mathematics. He then entered on a regular course of theological training; but, after two sessions at St. Andrews and one at Edinburgh, he abandoned all idea of the church, and in 1786 settled in his native town as assistant-teacher of mathematics and natural philosophy in a newly established academy. Three years later he became partner in and manager of a flax-spinning company at Douglastown in Forfarshire, still, however, prosecuting in moments of leisure his favorite studies. He was essentially a self-trained mathematician, and was not only deeply versed in the ancient and modern geometry, but had also, what was extremely rare in his country in those days, a full knowledge of the analytical methods and discoveries of the Continental mathematicians. His earliest memoir, dealing with an analytical expression for the rectification of the ellipse, is published in the *Transactions of the Royal Society of Edinburgh* for the year 1796; and this and his later papers on "Cubic Equations" (1799) and "Kepler's Problem" (1802) evince great facility in the handling of algebraic formulæ. In 1804 after the dissolution of the flax-spinning company of which he was manager, he obtained one of the mathematical chairs in the Royal Military College at Marlow (afterwards removed to Sandhurst); and till the year 1816, when failing health obliged him to resign, he discharged his professional duties with remarkable success. During this period he published in the *Philosophical Transactions* several important memoirs, which earned for him the Copley medal in 1814, and ensured his election as a Fellow of the Royal Society in 1815. Of special importance in the history of attractions is the first of these earlier memoirs (*Phil. Trans.*, 1809), in which the problem of the attraction of a homogeneous ellipsoid upon an external point is reduced to the simpler case of the attraction of another but related ellipsoid upon a corresponding point interior to it. This beautiful theorem is known as Ivory's theorem. His later papers in the *Philosophical Transactions* treat of astronomical refractions, of planetary perturbations, of equilibrium of fluid masses, etc. For his investigations in the first named of these he received a royal medal in 1826 and again in 1839. In 1831, on the recommendation of Lord Brougham, King William IV. granted him a pension of £300 per annum, and conferred on him the Hanoverian Guelphic order of knighthood. His more purely scientific honors sufficiently prove the high position he held among his contemporaries. Thus, besides being directly connected with the chief scientific societies of his own country, the Royal Society of Edinburgh, the Royal Irish Academy, etc., he was corresponding member of the Royal Academy of Sciences both of Paris and Berlin, and of the Royal Society of Göttingen. He died September 21, 1842.

IVORY COAST, that part of the West African seaboard which lies between the Grain Coast (now almost all belonging to Liberia) and the Gold Coast, or between Cape Palmas on the west and the Assini river on the east. Slightly different limits are assigned by different writers, and part of the territory which belongs to the traditional Ivory Coast is now officially incorporated in the Gold Coast region, the western limit of which is placed at 5° W. long., a good way to the west of the Assini river. In the older books of travel (both English and foreign) we often find the alternative names Tooth Coast (*Zahn-Küste*) or Quaqua Coast, and less frequently the coast of the five and six stripes (alluding to a kind of cotton fabric in favor with the natives). The trade in ivory has long lost its importance, and at the present day there are very few European trading stations in this part of Guinea. Fort Nemour, Grand Bassam, Piccaninny Bassam, Drewin, and Walloo are the chief points of interest.

IVREA, the ancient *Eporedia*, a town of northern Italy, capital of a district of the same name, is situated at the foot of the Alps on an eminence at the southern extremity of the beautiful and luxurious Val d' Aosta, near the river Dora Baltea, and at the termination of a branch railway line from Chivasso, 29 miles north-north-east of Turin. It is irregularly built, and has an antique and picturesque appearance. The site of the old fortifications is now occupied by promenades. The town possesses an old citadel with three lofty brick towers; a cathedral, supposed to occupy the site of a temple of Apollo; an ecclesiastical seminary, a gymnasium, and several convents and benevolent institutions. The river is crossed by a Roman bridge of one arch. There are important silk manufactures, and a considerable trade in cheese, cattle, and other produce of the Alps. The population of the town in 1871 was 5093.

Ivrea occupied the site of the old Roman Eporedia, which originally belonged to the Salassi, and received a Roman colony about 100 B. C., founded in accordance with the directions of the Sibylline books. It afterwards became the seat of the Longobardian dukes, and on the conquest of the Longobards by Charlemagne it was made the capital of a marquisate. In 950 Berenger II. of Ivrea succeeded in mounting the Italian throne, but he held this position for only a short time. His grandson Otho became the founder of the line of the dukes of Burgundy. Arduin, marquis of Ivrea, again aspired to the throne of Italy after the death of Otho III. in 1002, and also disputed the possession of the imperial dignity with Henry II., but was defeated by Henry in 1003, after which Ivrea was incorporated with the empire. In 1248 the town and marquisate were given to the counts of Savoy. The town was occupied by the French in 1554, 1641, and 1704. In 1796 they again made themselves masters of it; and, after losing it for some time, they reacquired it in 1800, and held it till 1814, making it the capital of the department of Doire.

IVRY-SUR-SEINE, a town and commune of France, in the arrondissement of Sceaux and the department of Seine, is situated near the left bank of the river Seine, 4 miles south-east of Paris. It has an interesting old church, but of the castle of the 17th century the fine gardens are the chief memorial. In the Petit Château died the duchess of Orleans, mother of Louis-Philippe. Ivry manufactures cordage, organs, glass, matches, manure, and chemicals. There are numerous handsome villas and fine gardens in the neighborhood. The population in 1876 was 15,247.

Ivry-sur-Seine is of ancient foundation. In a charter of Louis IV. (D'Outremer), its name appears as Ivriacum, and in contemporary documents as Yvriacum. The fort of Ivry played an important part in the defence of Paris against the Germans in 1870-71, and in the Communist struggle of the latter year. Ivry-la-Bataille, in the department of Eure, where Henry IV. won his victory over the Leaguers in 1590, is not to be confounded with Ivry-sur-Seine.

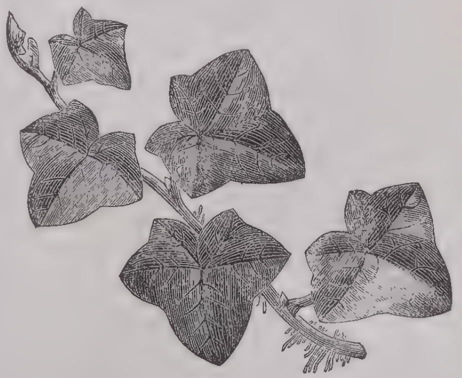

FIG. 1.—European Ivy (*Hedera Helix*). Half nat. size.

IVY (A. S., *Ifig;* Germ., *Epheu;* perhaps connected with *apium*, ἄπιον) is the collective designation of certain species and varieties of *Hedera*, the important alliances of which are *Aralia* and *Panax*, which, with some twenty other less-known genera, constitute the natural order *Araliaceæ*. There are fifty species of ivy recorded in modern books, but they may be reduced to three. The European ivy is the *Hedera Helix* of Linnæus (figs. 1–3), a plant subject to infinite variety in the forms and colors of its leaves, but the tendency of which is always to a three-lobed form when climbing and a regular ovate form of leaf when producing fruit (fig. 3). The African ivy is *H. canariensis*, Willd. (fig. 4), otherwise known as the Irish ivy, a native of Africa and the adjacent islands. This also varies, but in a less degree than *H. Helix*, from which its leaves differ in their larger size, rich deep green color, and a prevailing tendency to a five-lobed outline. When in fruit the leaves are usually three-lobed, but they are sometimes entire and broadly ovate. The Asiatic ivy is *H. colchica*, Koch (fig. 5), otherwise known as *H. rœgneriana* and *H. ragusina*. This has ovate, obscurely three-lobed leaves of a coriaceous texture and a deep green color; in the tree or fruiting form the leaves are narrower than in the climbing form, and without any trace of lobes. Distinctive characters are also to be found in the appendages of the pedicels and calyx, *H. Helix* having six-rayed stellate hairs, *H. canariensis* fifteen-rayed hairs, and *H. colchica* yellowish two-lobed scales. A revision of the natural order *Hederaceæ* by the late Dr. B. Seemann will be found in the *Journal of Botany*, 1864–5–6.

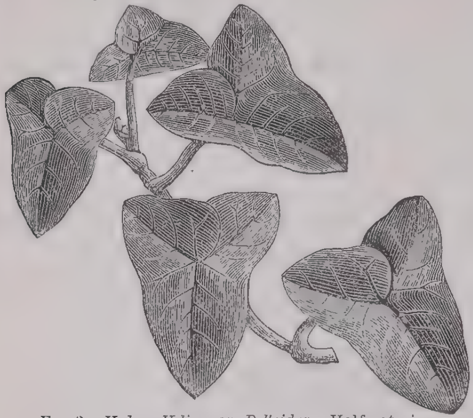

FIG. 2.—*Hedera Helix*, var. *Deltoidea*. Half nat. size.

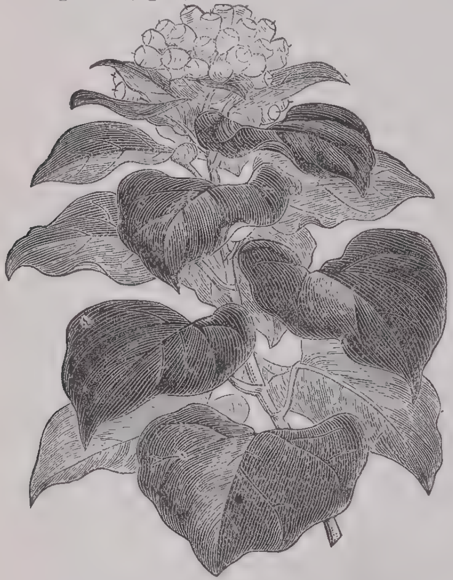

FIG. 3.—Fruiting Form of *Hedera Helix*. Half nat. size.

It is of the utmost importance to note the difference of characters of the same species of ivy in its two conditions of climbing and fruiting. The first stage of growth, which we will suppose to be from the seed, is essentially scandent, and the leaves are lobed more or less. This stage is accompanied with a plentiful production of the claspers by means of which the plant becomes attached and obtains support. When it has reached the summit of the tree or tower, the stems being no longer able to maintain a perpendicular attitude fall over and become horizontal or pendent. Coincidently with this change they cease to produce claspers, and the leaves are strikingly modified in form, being now narrower and less lobed than on the ascending stems. In due time this tree-like growth produces terminal umbels of greenish flowers, which are five-divided, with the styles united into a very short one. These flowers are succeeded by smooth black or yellow berries, containing two to five seeds. The yellow-berried ivy is met with in northern India and in Italy, but in northern Europe it is known only as a curiosity of the garden, where, if sufficiently sheltered and nourished, it becomes an exceedingly beautiful and fruitful tree.

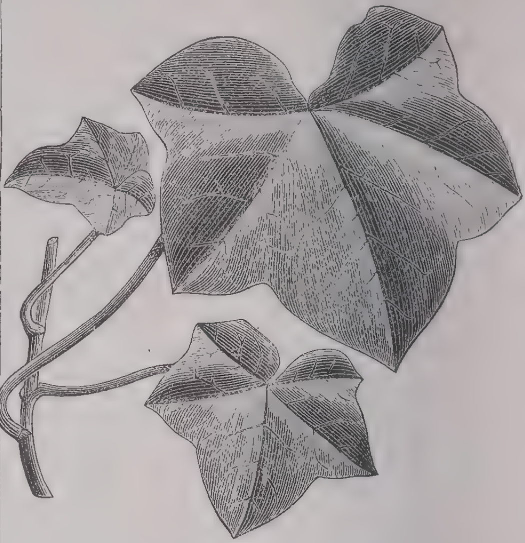

FIG. 4.—African Ivy (*Hedera canariensis*). Half nat. size.

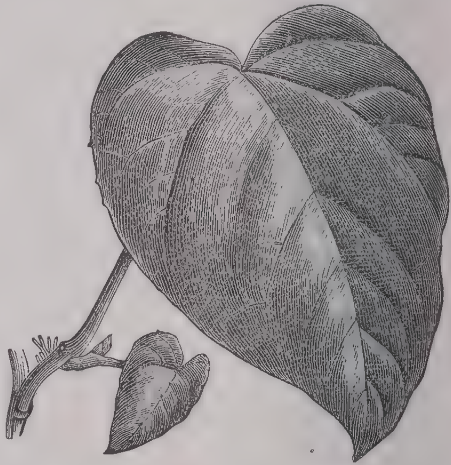

FIG. 5.—Asiatic Ivy (*Hedera colchica*). One-third nat. size.

It is stated in books that some forms of sylvestral ivy never flower, but a negative declaration of this kind is valueless. Sylvestral ivies of great age may be found in woods on the western coasts of Britain that have apparently never flowered, but this is probably to be explained by their inability to surmount the trees supporting them, for until the plant can spread its branches horizontally in full daylight, the flowering or tree-like growth is never formed. As regards the claspers, respecting which various views prevail, they are veritable roots, as may be proved by planting an ivy in a damp fern case, when the claspers acquire a new character and penetrate the soil and perform all the functions of roots, suggesting that the hard felt-like form in which they appear on old ivy stems is the consequence simply of an arrest of development. We occasionally see ivies on towers completely isolated from the soil through the destruction of their stems. In these cases the claspers penetrate the structure, and in the capacity of roots obtain the needful sustenance, and the plant lives though no longer deriving nourishment from the earth.

A question of great practical importance arises out of the relation of the plant to its means of support. A moderate growth of ivy is not injurious to trees; still the tendency is from the first inimical to the prosperity of the tree, and at a certain stage it becomes deadly. Therefore the growth of ivy on trees should be kept within reasonable bounds, more especially in the case of trees that are of special value for their beauty, history, or the quality of their timber. In regard to buildings clothed with ivy, there is nothing to be feared so long as the plant does not penetrate the substance of the wall by means of any fissure. Should it thrust its way in, the natural and continuous expansion of its several parts will necessarily hasten the decay of the edifice. But a fair growth of ivy on sound walls that afford no entrance beyond the superficial attachment of the claspers is, without any exception whatever, beneficial. It promotes dryness and warmth, reduces to a minimum the corrosive action of the atmosphere, and is altogether as conservative as it is beautiful.

The economical uses of the ivy are not of great importance. The wood is used by leather cutters to sharpen their knives. From the trunk a resinous substance is obtained called "ivy gum," which is employed for the relief of toothache. The leaves are eaten greedily by horses, deer, cattle, and sheep, and in times of scarcity have proved useful. The flowers afford a good supply of honey to bees; and, as they appear in autumn, they occasionally make amends for the shortcomings of the season. The berries are eaten by wood pigeons, blackbirds, and thrushes. From all parts of the plant a balsamic bitter may be obtained, and this in the form of *hederic acid* is the only preparation of ivy known to chemists.

In the garden the uses of the ivy are innumerable, and the least known though not the least valuable of them is the cultivation of the plant as a bush or tree, the fruiting growth being selected for this purpose. The variegated tree forms of *H. Helix*, with leaves of creamy white, golden green, or rich deep orange yellow, soon prove handsome miniature trees, that thrive almost as well in smoky town gardens as in the pure air of the country, and that no ordinary winter will injure in the least. The tree-form of the Asiatic ivy (*H. colchica*) is scarcely to be equalled in beauty of leafage by any evergreen shrub known to English gardens, and, although in the course of a few years it will attain to a stature of 5 or 6 feet, it is but rarely we meet with it, or indeed with tree ivies of any kind; but little attention hitherto having been given to this subject. The scandent forms are more generally appreciated, and are now much employed in the formation of marginal lines, screens, and trained pyramids, as well as for clothing walls. A very striking example of the capabilities of the commonest ivies, when treated artistically as garden plants, may be seen in the Zoological Gardens of Amsterdam, where several paddocks are enclosed with wreaths, garlands, and bands of ivy in a most picturesque manner.

The ivies known in gardens number about sixty varieties, the whole of which are figured and described in *The Ivy, a Monograph*, by Shirley Hibberd, 1872. To cultivate these is an extremely simple matter, as they will thrive in a poor soil and endure a considerable depth of shade, so that they may with advantage be planted under trees. The common Irish ivy is often to be seen clothing the ground beneath large yew trees where grass would not live, and it is occasionally planted in graveyards in London to form an imitation of grass turf, for which purpose it is admirably suited.

The ivy, like the holly, is a scarce plant on the American continent. In the northern United States and British America the winters are not more severe than the ivy can endure, but the summers are too hot and dry, and the requirements of the plant have not often obtained attention. In districts where native ferns abound the ivy will be found to thrive, and the varieties of *Hedera Helix* should have the preference. But in the drier districts ivies might often be planted on the north side of buildings, and, if encouraged with water and careful training for three or four years, would then grow rapidly and train themselves. A strong light is detrimental to the growth of ivy, but this enhances its value, for we have no hardy plants that may be compared with it for variety and beauty that will endure shade with equal patience. (S. H.)

IXION, a hero of Thessalian legend, was king of Gyrton. As a punishment for the murder of his father-in-law, Deioneus, madness came upon him, until Zeus purified him of his crime and received him as a guest in Olympus. Æschylus uses him as the type of a guilt-laden mortal purified and pardoned by divine grace, and the mythical representative of all later penitents (*Eum.*, 441). Ixion abused his pardon by trying to seduce Hera; but the goddess substituted for herself a cloud, by which he became the father of the Centaurs. Zeus bound him on a fiery wheel, which rolls unceasingly through the air. The wheel is one of the commonest symbols of the sun, and Ixion is clearly the sun-god, and a form of Zeus. His wife Dia is, as her name shows, the consort of Zeus (*Il.*, xiv. 317), and her son Pirithous is called son of Zeus as well as of Ixion. Nephele, the cloud, occurs also as wife of Zeus-Athamas, as here of Zeus-Ixion.

J.

J. THIS letter is a modified I. If we consider its place in the alphabet immediately after I, and the corresponding position of V and W after U, we are naturally led to conclude that the new letter was intentionally formed by some one who wished to have a special symbol to denote the palatal consonant *y*, into which *i* readily passes, just as *w* denotes the labial consonant into which *u* passes. For the symbol is a new one. It is not found in the Latin alphabet, in which I was employed alike for the vowel and consonant—though sometimes the I was doubled for the consonant. So far, however, as we can see, J in its origin was nothing but a fancy of the scribes. In 15th-century English MSS. the *i*-symbol was drawn a little below the line to denote J, and by degrees this was curled slightly to the left. Again in writing numbers such as vii, viii, it was usual to write uij, uiij, etc. This was imitated in early printing, and hence arose *j*, the earliest regularly curled form. At the same time we find only I in capitals, not J—a modern letter made to correspond with little *j*. This at least seems to have been the history of the symbol in England, and possibly the French history is similar.

It follows from this that the value of J ought to have been in all languages, not that which it has with us, nor yet that which it has in France, but that which it has in Germany, *e.g.*, in "Jahr," our "year,"—which is retained by us in the borrowed Hebrew word "Hallelujah." But generally in English J denotes the sound which is best represented by *dzh;* in this compound *zh* represents the French *j*-sound: the difference between the two may be well seen by comparing the English "John" with French "Jean" (Engl. J = *dzh*, Fr. J = *zh*). J, however, is not the only symbol which we employ to represent this sound; we also use G in "gem," "gin," and GE at the end of words such as "edge," "hedge," "wedge," "knowledge," "singe"; while the *zh*-sound (which is the sonant corresponding to the surd *sh* in "shall," "wish," etc.) is never represented with us by J, but by numerous other letters, *e.g.*, in rou*g*e (a word borrowed from the French), plea*s*ure, divi*s*ion, a*z*ure. See A. J. Ellis, *Early English Pronunciation*, c. vi.

The way in which this *dzh*-sound arose seems to have been as follows. In mediæval Latin an inorganic *d*-sound was produced before a *y*-sound,—sometimes when medial, as in "ma-d-ius" for "maius," sometimes initial, as in "diacere" for "iacere." This arose from a careless pronunciation of the palatal *y*. That sound has been liable to obscuration in many languages—notably in Greek, in which a δ was developed before it to a very remarkable degree; see Curtius, *Grundzüge*, book iii. D. iii. A simple example may be seen in the particle δή, which is identical with German "jā" our "yea": the sound of the word was originally yā; then in Greek a *d* sprang up before the *y*, producing *dyā;* and finally the *y* was expelled altogether, leaving the *d*-sound alone. Sometimes a double sound was produced (denoted by the symbol *z*) as in ζημία for (*d*)yām-ia or ἐλπίζω for *ἐλπιδ-yo;* here the sound may have been *dzh*, but was more probably *dz:* be this as it may, the change in Greek, which produced a great effect upon the language, may help us to understand how the *d* sprang up in late Latin, and how the compound sound *dzh* was perpetuated in Italian—but there represented by *gi*, as in "giacere," "Giacomo," etc.—and in Old French, in which language it passed at a later time into the modern *zh*-sound described above. But it was introduced into England from France with its original value in French words. The sound, however, had already existed in England in words of Teutonic origin, the class already mentioned ending in *ge;* "edge" was originally spelt "ecg," and was doubtless sounded as we now sound "egg"; but the final *g*-sound had been palatized, though probably not before the 13th century. These are the two sources of the *dzh*-sound in England, and it is noteworthy that the sound when final has never been spelt with *j*, as though a consciousness of the difference of origin in these cases lingered on in the language. A parallel change (but much more common) has taken place in the *k*-sound: this passed into a *ch*-sound in very many words and not merely at the end, but also at the beginning as in "chill," "child," "church," etc., and this *ch*-sound is not the simple palatal *ch*, but *tsh*, which therefore bears exactly the same relation to *k* as *dzh* (our *j*) bears to *g*.

It appears then that the symbol J ceased to have its proper signification in English by connection with that of another compound sound borrowed from the French. Meanwhile another symbol Y was being prepared to do the work of J. G at the beginning of a word was often weakened into the *y*-sound: thus "*g*enew" (comp. German "genug") became "ynow," our "enough." Then the old English form of *g* (that is, ȝ) was used to express this *y*-sound, and out of it the symbol *y* was gradually developed, while the French form (*g* or nearly so) was kept for the momentary sound.

In Spanish the symbol J denotes the momentary sound corresponding to *y*,—that is, the palatal denoted by *ch* in German, and heard also in Scotland, *e.g.*, in "loch."

JABALPUR, or JUBBULPORE,[1] a British district in the commissionership of the Central Provinces, India, between 21° 12′ and 23° 56′ N. lat., and between 76° 40′ and 81° 35′ E. long., is bounded on the N. by Panna and Maihar, on the E. by Rewah, on the S. by the districts of Mandla, Seoní, and Narsinhpur, and on the W. by Damoh district.

Jabalpur consists of a long narrow plain running northeast and southwest, and shut in on all sides by highlands. This plain, which forms an offshoot from the great valley of the Nerbudda, is covered in its western and southern portions by a rich alluvial deposit of black-cotton-soil. At Jabalpur town the soil is sandy, and water plentiful near the surface. The north and east belong to the Ganges and Jumna basins, the south and west to the Nerbudda basin. Thus between Jabalpur and Mírzápur lies the great watershed betwixt the Gulf of Cambay and the Bay of Bengal. The Nerbudda flows through the district for 70 miles from east to west, passing about 9 miles below Jabalpur town through the famous marble rocks, where it throws itself from a rocky ledge with a fall of 30 feet, called *Dhuán-dhar*, or the "misty shoot."

The population was estimated in 1877 at 555,796; but a more careful census taken in 1872 returned it at 528,859, of whom 270,237 were males and 258,622 females. The ethnical division in 1877 showed—Europeans, 776; Eurasians, 201; aboriginal tribes, 105,349; Hindus, 416,770; Mahometans, 27,282; Buddhists and Jains, 3654. Jabalpur, the capital, which has a population of 55,188, is the only town with more than 5000 inhabitants. Of the total area of 3918 square miles, only 1320 are cultivated, but 1308 more are returned as cultivable. Of the cultivated lands 3949 acres are irrigated—entirely by private enterprise. Cereals, rice, cotton, and oil-seeds are the principal crops. The district is rich in garden produce, raising, besides the ordinary Indian fruits, peaches, pineapples, strawberries, and potatoes. Both the plains and the high lands are well wooded; the forest produce is of considerable value, consisting of lac and gum, and *tasar* silk. The trade of the district converges at Jabalpur town, which is one of the most important railway centres in India, being at the junction of the Great Indian Peninsula and East Indian systems. One of the chief manufactures is iron. The most productive mines are at Dabwárá, Agariá, and Jantí; but the most important are those of the Kumbhí parganá, which supply Panágur, the chief seat of the iron industry in the district. The other manufactures include brass utensils, cotton cloth, and leather articles. Coal is found at several places. The total revenue in 1876-77 was £76,013. The number of Government or aided schools was 125, attended by 7015 pupils. The climate is healthy, and the temperature extremely moderate. As a rule, the hot weather extends only over two months, and, except immediately before the rains, is not oppressive. The rains last from early in June until the latter part of September. The prevailing diseases of the district are fevers and dysentery. Cholera and small-pox are occasional visitants, and influenza at times assumes the character of an epidemic. In 1876 eight charitable dispensaries afforded medical relief to 35,795 indoor and outdoor patients.

The early history of Jabalpur is unknown; but inscriptions record the existence during the 11th and 12th centuries of a local line of princes of that Haihai race which is so closely connected with the history of Gondwáná. In the 16th century the Gond rájá of Garhá Mandla extended his power over fifty-two districts, including the present Jabalpur. During the minority of his grandson, Asaf Khán, the viceroy of Kara Mánikpur, conquered the Garhá principality and held it at first as an independent chief.

---

[1] The division of Jabalpur or Jubbulpore is one of the four which make up the Central Provinces. It comprises the districts of Jabalpur, Ságar (Saugor), Damoh, Seoní, and Mandla, has an area of 18,564 square miles, and in 1878 had a population of 1,839,100.

Eventually he resigned his pretensions, and submitted himself to the emperor Akbar. The Delhi power, however, enjoyed little more than a nominal supremacy; and the princes of Garhá Mandla maintained a practical independence until their subjugation by the governors of Ságar (Saugor) in 1781. In 1798 the peshwá granted the Nerbudda valley to the Bhonslá princes of Nágpur, who continued to hold the district until the British occupied it after an engagement on the 19th December, 1817. At first the Ságar and Nerbudda territories were governed by a commissioner in subordination to the resident at Nágpur; but in 1861 Jabalpur was formed into a separate district of the Central Provinces.

JABALPUR, or **JUBBULPORE**, the headquarters of the above district, is situated in 23° 11′ N. lat., 79° 59′ E. long., in a rocky basin, at an elevation above sea-level of about 1458 feet, 165 miles northeast from Nágpur, and 108 miles southeast from Ságar. The numerous gorges in the neighboring rocks have been taken advantage of to surround the town with a series of lakes, which, shaded by fine trees, and bordered by fantastic crags and massy boulders, add much beauty to the suburbs. The town itself is modern, and is laid out in wide and regular streets. A streamlet separates the civil station and cantonment from the town; but, though the climate is mild, a swampy hollow beneath renders the site unhealthy for Europeans. Jabalpur contains a school of industry, where tents and carpets are largely manufactured. The opening of the railway system has immensely developed the trade of Jabalpur, which has now become one of the most important centres of commerce in the Central Provinces. In 1875–76 the total imports were valued at £567,000, the chief items being piece-goods, wheat, sugar, metals, salt, rice, country cloth, oil-seeds, spices, *ghí*, oil, inferior grains, lac, and raw cotton. The total exports, principally raw cotton and wheat, were valued at £160,000. The population, almost entirely Hindu, was 55,188 in 1877.

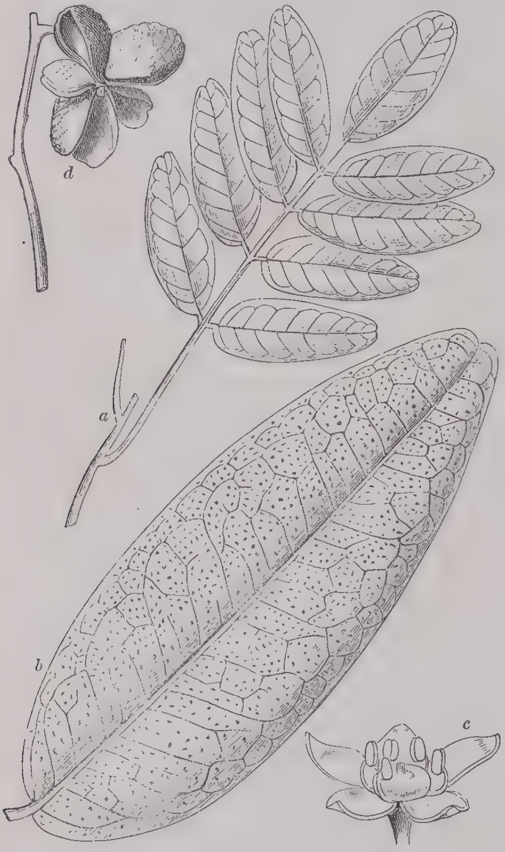
JABIRU, according to Marcgrave[1] the Brazilian name of a bird, subsequently called by Linnæus *Mycteria americana*, one of the largest of the Storks, *Ciconiidæ*, which occurs from Mexico southwards to the territory of the Argentine Republic It stands between 4 and 5 feet in height, and is conspicuous for its massive bill, slightly upturned, and its entirely white plumage; but the head and neck are bare and black, except for about the lower third part of the latter, which is bright red in the living bird. Very nearly allied to *Mycteria*, and also commonly called Jabirus, are the birds of the genera *Xenorhynchus* and *Ephippiorhynchus*—the former containing one or (in the opinion of some) two species, *X. australis* and *X. indicus*, and the latter one only, *E. senegalensis*, These belong to the countries indicated by their names, and differ chiefly by their feathered head and neck, while the last is sometimes termed the Saddle-billed Stork from the very singular shape of its beak. Somewhat more distantly related are the gigantic birds, known to Europeans in India and elsewhere as Adjutants, belonging to the genus *Leptoptilus*, distinguished by their sad-colored plumage, their black scabrous head, and their enormous tawny pouch, which depends occasionally some 16 inches or more in length from the lower part of the neck, and seems to be connected with the respiratory, and not, as commonly believed, with the digestive system. In many parts of India *L. dubius*, the largest of these birds, the *Hargila* as Hindus call it, is a most efficient scavenger, sailing aloft at a vast height and descending on the discovery of offal, though frogs and fishes also form part of its diet. It familiarly enters the large towns, in many of which on account of its services it is strictly protected from injury, and, having satisfied its appetite, seeks the repose it has earned, sitting with its feet extended in front in a most grotesque attitude. A second and smaller species, *L. javanicus*, has a more southern and eastern range; while a third, *L. crumenifer*, of African origin, and often known as the Marabou-Stork, gives its name to the beautifully soft feathers so called, though our markets are mostly supplied with them by the Indian species (in which they form the lower tail-coverts), if not, as some suppose, by Vultures. (A. N.)

Jabiru

JABORANDI, a name popularly applied in a generic manner in Brazil and South America to a number of different plants, all of which possess more or less marked sialogogue and sudorific properties. In the year 1875 a drug was introduced under the above name to the notice of medical men in France by Dr. Coutinho of Pernambuco, its botanical source being then unknown. When examined by Professor Baillon, the fragments of leaves were found to belong to *Pilocarpus pennatifolius*, Lem., of the natural order *Rutaceæ*. About the same time Holmes found that the commercial drug in England consisted also to some extent of *P. Selloanus*, Engl., and his statement was afterwards confirmed by Baillon, and also by Balansa, the latter of whom observed that species to be employed in Asuncion, and collected for exportation to Europe. *P. pennatifolius* is a slightly branched shrub about 10 feet high, growing in the eastern provinces of Brazil. The compound imparipinnate leaves, which are placed alternately on the stem, are often 1½ feet long, and consist of from 2 to 5 pairs of opposite leaflets, the terminal one having a longer pedicel than the others. The leaflets are oval, lanceolate, entire, and obtuse, and often slightly emarginate, from 3 to 4 inches long and 1 to 1½ inch broad in the middle. When held up to the light they may be observed to have scattered all over them numerous pellucid dots or receptacles of secretion immersed in the substance of the leaf. The leaves in size and texture bear some resemblance to those of the cherry-laurel (*Prunus Laurocerasus*, L.), but are less polished on the upper surface. The flowers, which are produced in spring and early summer, are borne on a raceme, 6 or 8 inches long, and the fruit consists of 5 carpels, of which not more than two or three usually arrive at maturity. These present the characters of the natural order to which the plant belongs. (See *Pharm. Journ.*, ser. 3, vol. v. p. 582.) *P. Selloanus* differs from the above chiefly in the leaves never being hairy and in the longer and more slender pedicels of the flowers. The leaves are the part of the plant usually imported, although occasionally the stems and roots are attached to them. The active principle for which the name *pilocarpine*, suggested by Holmes, was ultimately adopted, was discovered almost simultaneously by Hardy in France and Gerrard in England, but was first obtained in a pure state by Petit of Paris. It is an alkaloid, of a soft viscous character, slightly soluble in water, and very soluble in alcohol, ether, and chloroform. It strongly rotates the plane of polarization to the right, and forms crystalline salts of which the nitrate, hydrochlorate, and phosphate are those chiefly used in medicine. The nitrate and phosphate are insoluble in ether, chloroform, and benzol, while the hydrochlorate and hydrobromate dissolve both in these menstrua and in water and alcohol; the sulphate and acetate being deliquescent are not employed medicinally. The formula of the alkaloid is given by Kingzett as $C_{23}H_{34}N_4O_4 + 4H_2O$. The volatile oil contained in the leaves was found by Hardy to be a complex body consisting of *pilocarpine*, which is a dextrogyre hydrocarbon, sp. gr. 0·852, boiling at 178° C. (352°·4 Fahr.), of another hydrocarbon boiling at 250° C. (492° Fahr.), and a third boiling at a still higher temperature, and forming a colorless transparent solid.

---

[1] An apparently accidental transposal of two of the figures given by this author (*Hist. Nat. Brasiliæ*, pp. 200, 201) misled several of his successors from Piso to Brisson, until noticed by De Buffon (*Hist. Nat. Oiseaux*, vii. pp. 280–286).



Jaborandi—*a*, leaf (reduced): *b*, leaflet (natural size): *c*, flower; *d*, fruit (natural size).

The physiological action of jaborandi is that of an extremely powerful diaphoretic and sialogogue. It acts as a sedative on the heart, probably influencing the circulation through the terminal branches of the vasomotor nerves, and widening the arteries and lessening their tension. The alkaloid does not cause the nausea and vertigo often resulting from the use of the crude drug. Atropine and pilocarpine have been proved to possess antagonistic and mutually antidotal properties. Jaborandi, in the form of liquid extract, tincture, or alkaloid, has been found useful in some forms of chronic pneumonia, in relieving pleuritic effusion in dropsy, in diabetes insipidus, in Bright's disease, as a galactogogue, and more recently in diphtheria. In small doses it restrains the perspiration of phthisis. It has also been proposed as a remedy for hydrophobia. As a mydriatic pilocarpine is said to possess an advantage over eserine, inasmuch as it contracts the pupil of the eye to an equal extent, while it produces less irritation of the conjunctiva, less supraorbital pain, and less spasm of the accommodating apparatus.

According to Peckolt the following are known in some of the Brazilian provinces as jaborandi:—*Serronia Jaborandi*, Guill., *Piper reticulatum*, L., *P. nodulosum*, Link., *Artanthe mollicoma*, Miq., *Aubletia trifolia*, Rich., *Xanthoxylum elegans*, Engl. To these may be added *Piper citrifolium*, Lam. Only one of them appears to have undergone chemical examination. In 1875 Parodi isolated from the *Serronia Jaborandi* a crystalline alkaloid $C_{10}H_{12}N_2O_6$, which he named *jaborandine*. It is slightly soluble in ether, has but a weak affinity for acids, and appears to belong to the piperine group; at the same time a volatile oil of an acrid and biting taste was also obtained from the plant.

Soc.*, Oct., 1876, p. 367; Hardy, in *Pharmaceutical Journal* (3) vi. p. 565, vii. p. 496; Holmes, *Ibid.* (3) v. pp. 581, 641, 784; and other papers in the same journal and in *British Medical Journal*, 1875, 1876, 1877. (E. M. H.)

JACA, a frontier city of Spain, in the province of Huesca, formerly capital of a partido in the kingdom of Aragon, is situated on the left bank of the Aragon, at an elevation of 2333 feet above the sea-level. It is the seat of a bishop, and the most important of the public buildings is the massive cathedral, the construction of which was begun under King Ramiro in 1040. The industries of the city are unimportant. Its population in 1877 was 4155. The diligence road from Zaragoza to Pau by the Puerto de Canfranc passes through Jaca.

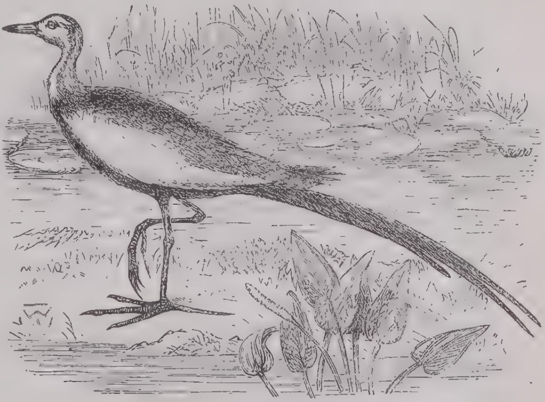
The origin of the city is unknown. The Jaccetani (Ἰακκητανοί) are mentioned as one of the most celebrated of the numerous small tribes inhabiting the basin of the Ebro by Strabo (p. 161), who adds that their territory was the theatre of the wars between Sertorius and Pompey, and afterwards between Pompey's son Sextus and the generals of Cæsar. They are probably identical with the Lacetani of Livy (xxi. 60, 61) and Cæsar (B. C., i. 60). Jaca at an early period of the invasion fell into the possession of the Moors, by whose writers it is referred to under the name of Dyaka as one of the chief places in the province of Sarkosta (Zaragoza). The date of its reconquest is uncertain, but it must have been before the time of Ramiro, who gave it the title of "city," and in 1063 held within its walls a council, which, inasmuch as the people were called in to sanction its decrees, is regarded as having been of great importance in the history of the parliamentary institutions of the peninsula. The original "fuero" of Jaca is one of the oldest extant. In 1705 Jaca was the only city which stood out for King Philip, from whom, in consequence, it received the title of "muy noble, muy leal y vencedora." In the war of independence in 1809 it surrendered to the French; it also yielded to General Mina in 1814.

JACAMAR, a word formed by Brisson from *Jacameri*, the Brazilian name of a bird, as given by Marcgrave, and since adopted in most European tongues for the species to which it was first applied and others allied to it, forming the Family *Galbulidæ*[1] of ornithologists, the precise position of which is uncertain, since the best authorities differ greatly thereupon. All will agree that the Jacamars belong to the great heterogeneous group called by Nitzsch *Picariæ*, but further into detail it is hardly safe to go. The *Galbulidæ* have zygodactylous feet, like the *Cuculidæ*, *Bucconidæ*, and *Picidæ*, they also resemble both the latter in laying glossy white eggs, but in this respect they bear the same resemblance to the *Momotidæ*, *Alcedinidæ*, *Meropidæ*, and some other groups, to which affinity has been claimed for them. In the opinion of Mr. Sclater[1] the Jacamars form two groups—one consisting of the single genus and species *Jacamerops aureus* (*J. grandis* of most authors), and the other including all the rest, namely, *Urogalba* with two species, *Galbula* with nine, *Brachygalba* with five, and *Jacamaralcyon* and *Galbalcyrhynchus* with one each. They are all rather small birds, the largest known being little over 10 inches in length, with sharply pointed bills, and the plumage in every case more or less resplendent with golden or bronze reflections, but at the same time comparatively soft. *Jacamaralcyon tridactyla* differs from all the rest in possessing but three toes (as its name indicates) on each foot, the hallex being deficient. With the exception of *Galbula melanogenia*, which is found also in Central America and southern Mexico, all the Jacamars inhabit the tropical portions of South America eastward of the Andes, *Galbula ruficauda*, however, extending its range to the islands of Trinidad and Tobago.[2] Very little is known of the habits of any of the species. They are seen sitting motionless on trees, sometimes solitarily, at other times in companies, whence they suddenly dart off at any passing insect, catch it on the wing, and return to their perch. Of their nidification almost nothing has been recorded, but the species above mentioned as occurring in Tobago is said by Mr. Kirk—apparently the only European observer of the mode of propagation in these birds—to make its nest in marl-banks, digging a hole about an inch and a half in diameter and some 18 inches deep. From the accounts received by other travellers we may possibly infer that more of the Family possess the same habit. (A. N.)

---

[1] *Galbula* was first applied to Marcgrave's bird by Mœhring. It is another form of *Galgulus*, and seems to have been one of the many names of the Golden Oriole. See ICTERUS (vol. xii. p. 735).

JACANA,[3] the Brazilian name, according to Marcgrave, of certain birds, since found to have some allies in other parts of the world, which are also very generally called by the same appellation. They have been most frequently classed with the Water-hens or Rails (*Rallidæ*), but are now recognized by many systematists as forming a separate Family. *Parridæ*,[4] whose leaning seems to be rather towards the *Limicolæ*, as apparently first suggested by Blyth, a view which is supported by the osteological observations of Professor Parker (*Proc. Zool. Society*, 1863, p. 513), though denied by Professor A. Milne-Edwards (*Ois. foss. de la France*, ii. p. 110). The most obvious characteristic of this group of birds is the extraordinary length of their toes and claws (the latter being turned upwards), whereby they are enabled to walk with ease over water-lilies and other aquatic plants growing in rivers and lakes. It is also remarkable for the carpal spurs with which its members are armed. The Family has been divided into four genera,—of which *Parra*, as now restricted, inhabits South America; *Metopidius*, hardly differing from it, has representatives in Africa, Madagascar, and the Indian Region; *Hydralector*, also very nearly allied to *Parra*, belongs to the northern portion of the Australian Region; and *Hydrophasianus*, the most extravagant form of the whole, is found in India, Ceylon, and China—the draughtsmen of the country last named making it a favorite subject of their pictures, in which its flowing tail and the very peculiar filamentous appendages to the tip of its first and fourth primaries are generally faithfully represented. In habits the Jacanas have much in common with the Water-hens, but that fact is insufficient to warrant the affinity asserted to exist between the two groups; for in their osteological structure, as already implied, there is much difference, and the resemblance seems to be only that of analogy. The *Parridæ*, or at least such of them as have been sufficiently observed, lay very peculiar eggs, of a rich olive-brown color, in most cases closely marked with dark lines, thus presenting an appearance by which they may be readily known from those of any other birds, though an approach to it is occasionally to be noticed in those of certain *Limicolæ*, and especially of certain *Charadriidæ*. The genus *Palamedea*, consisting of the bird very commonly called the Horned Screamer, was at one time thought to be allied to this Family, but is now, by almost common consent, relegated to the neighborhood of the Geese (*Anatidæ*), though forming a separate Family. (A. N.)



Jacana.

JACINTH, a name given to the reddish-brown variety of zircon, known also as *Hyacinth*. The hyacinthus of ancient writers appears to have been our sapphire, or blue corundum, while the jacinth or hyacinth of modern mineralogists may have been the ancient *lyncurium*. The true jacinth is a silicate of zirconium, crystallizing in the dimetric or tetragonal system, and exhibiting strong double refraction. Its hardness is denoted by 7.5; that is to say, it is harder than quartz but not so hard as topaz. The most distinctive feature of the stone, serving to distinguish it from other minerals with which it is likely to be confounded—such as garnet, topaz, and cairngorm—is its high specific gravity; this varies, however, in different varieties of zircon from 4.05 to 4.75. On ignition, most zircons increase in density without loss of weight, but Professor Church has shown that the jacinth of Mudgee, when heated, remains practically unchanged in density, though it loses color. It is only when the native silicate of zirconium presents a red color that it is known as jacinth or hyacinth,—those varieties which are of yellow brown and green colors being distinguished, if transparent, by the name of *jargoon*, while the dull-colored varieties, more or less opaque, are termed simply *zircon*. The lustre of the zircon when polished is of the peculiarly brilliant character designated *adamantine*, and indeed some of the pale jargoons are often sold as inferior diamonds. The Singalese variety, found chiefly at Matura, has been termed "Matura diamond." The true jacinth, or red zircon, is an extremely rare stone. Fine examples, however, have been found of late years as pebbles among the auriferous detritus at Mudgee in New South Wales. Small crystals occur in the river-sands of Expailly, Puy-en-Velay, France, but these are too small to be cut as ornamental stones. Most of the gems termed jacinth or hyacinth by jewellers belong to the deep orange-brown variety of garnet known to mineralogists as *essonite* or *cinnamon stone:* the lower specific gravity of the garnet serves to distinguish the false from the true jacinth. It is probable that many of the antique camei and intagli reputed to be jacinths are merely hyacinthine garnets.

---

[1] *A Monograph of the Jacamars and Puff-birds*, 4to, London (in course of publication).

[2] The singular appearance, recorded by Canon Tristram (*Zoologist*, p. 3906), of a bird of this species in Lincolnshire seems to require notice. No instance seems to be known of any Jacamar having been kept in confinement or brought to this country alive. The fact, if such it be, is therefore more difficult of explanation than the occurrence of Dr. Plot's Toucan near Oxford.

[3] In pronunciation the *c* is soft, and the accent placed on the last syllable.

[4] The classic *Parra* is by some authors thought to have been the Golden Oriole (*cf.* ICTERUS), while others suppose it was a Jay or Pie. The word seems to have been imported into Ornithology by Aldrovandus, but the reason which prompted Linnæus to apply it, as he seems first to have done, to a bird of this group, cannot be satisfactorily stated.

Jackal.

JACKAL (*Canis aureus*), a carnivorous mammal belonging to the dog family (*Canidæ*), and believed by many naturalists to be one of the species from which certain of the semi-domesticated dogs of Asia and North Africa have been derived. It is dog-like in external appearance, and there is, according to Geoffroy Saint Hilaire, no constant difference between its structure and that of the small canine races. It resembles them in dentition, in the roundness of its eye pupils, in its period of gestation, and to a large extent also in its habits, while like the dog it is subject to hydrophobia. It grows to a height of 15 inches at the shoulders, and to a length of about 2 feet, exclusive of its bushy fox-like tail. Its fur is of a greyish-yellow color, darker on the back and lighter colored beneath. An excrescence consisting of a horny cone, half an inch in length, and concealed by a tuft of hair, is, according to Emerson Tennent, sometimes found on the head of the jackal. The Singhalese aver that it is only found on the leader of the pack, and they esteem it as an invaluable talisman. Jackals, of which there are several well-marked varieties, are widely distributed throughout southern Asia and the north of Africa. They are nocturnal animals, concealing themselves until dusk in woody jungles and other natural lurking places, thereafter sallying forth in packs, which sometimes number two hundred individuals, and visiting farmyards, villages, and towns in search of food. This consists for the most part of the smaller mammals and poultry, although their association in packs enables them also to hunt down antelopes and sheep. When unable to obtain living prey, they feed upon carrion and refuse of all kinds, and are thus useful in removing putrescent matter from the streets of Eastern towns. They are also fond of grapes and other fruits, and are thus the pests of the vineyard as well as the poultry-yard. The cry of the jackal has been described as even more appalling than that of the hyæna, a shriek from one member of a pack being the signal for a general chorus of screams, which is kept up during the greater part of the night. In India these animals are occasionally hunted with foxhounds and greyhounds, and from their extreme cunning and pluck they are said to afford excellent sport. When brought to bay, they frequently turn upon their assailants and inflict severe wounds with their teeth; at other times they have been known to feign death as a means of escape. Jackals are readily tamed; and domesticated individuals are said, when called by their masters, to wag their tails, crouch, and throw themselves on the ground, and otherwise behave in a dog-like fashion. The jackal, like the fox, has a peculiarly offensive odor, due to the secretion of a gland at the base of the tail, but in domesticated specimens this odor is much fainter than in the wild forms.

JACKDAW, or simply DAW (Old Low German, *Daha;* Dutch, *Kaauw*), the prefix being doubtless imitative of the bird's cry, as indeed is probably the substantive name[1]—one of the smallest species of the genus *Corvus* (CROW, vol. vi. p. 545), and a very well known inhabitant of Europe, the *C. monedula* of ornithologists. In some of its habits it much resembles its congener the ROOK (*q. v.*), with which it constantly associates during a great part of the year; but, while the Rook only exceptionally places its nest elsewhere than on the boughs of trees and open to the sky, the Daw almost invariably chooses holes, whether in rocks, hollow trees, rabbit-burrows, or buildings. Nearly every church-tower and castle, ruined or not, is more or less numerously occupied by Daws, and if they are not also tenants with us of our own dwellings, it is because convenient recesses are therein ordinarily wanting. Yet our chimneys frequently give them the accommodation they desire, much to the annoyance of the householder, who finds the funnel choked by the quantity of sticks brought together by the birds, since their industry in collecting materials for their nests is as marvellous as it often is futile.[2] In some cases the stack of loose sticks piled up by Daws in a belfry or tower has been known to form a structure 10 or 12 feet in height, and hence this species may be accounted one of the greatest nest-builders in the world. The style of architecture practised by the Daw thus brings it more than the Rook into contact with man, and its familiarity is increased by the boldness of its disposition, which, though tempered by discreet cunning, is hardly surpassed among birds. Its small size, in comparison with most of its congeners, alone incapacitates it from inflicting the serious injuries of which some of them are often the authors, yet its pilferings are not to be denied, though on the whole its services to the agriculturist are great, for in the destruction of injurious insects it is hardly inferior to the Rook, and it has the useful habit of ridding sheep, on whose backs it may be frequently seen perched, of some of their parasites.

The Daw displays the glossy black plumage so characteristic of the true Crows, varied only by the hoary grey of the ear-coverts, and of the nape and sides of the neck, which is the mark of the adult; but examples from the east of Europe and western Asia have these parts much lighter, passing into a silvery white, and hence have been deemed by some authorities to constitute a distinct species (*C. collaris*, Drumm.).

---

[1] See Professor Skeat's *Etymol. Dictionary*, pp. 153, 304.

[2] Some writers, as Jesse (*Scenes and Tales of a Country Life*, p. 57), have ascribed great sagacity to the Daw as a nest-builder, but the statement of this author seems open to a very different interpretation (Yarrell's *Br. Birds*, ed. 4, ii. p. 308, note); and Jardine's remark (*Nat. Library*, x. p. 236) that it often exhibits great want of instinct, seems to be quite justified by the known facts.

Further to the eastward occurs the *C. dauuricus* of Pallas, which has not only the collar broader and of a pure white, but much of the lower parts of the body white also. Japan and northern China are inhabited also by a form resembling that of western Europe, but wanting the grey nape of the latter. This is the *C. neglectus* of Professor Schlegel, and is said by Mr. Dresser, on the authority of Swinhoe, to interbreed frequently with *C. dauuricus*. These are all the birds that seem entitled to be considered Daws, though Mr. Sharpe (*Cat. B. Brit. Museum*, vol. iii. p. 24) associates with them (under the little-deserved separate generic distinction *Colœus*) the Fish-Crow of North America, which appears both in structure and in habits to be a true Crow. (A. N.)

JACKSON, chief city of Jackson county, Michigan, U. S., is situated on the Grand river, about 75 miles west of Detroit. The city is paved and lighted with gas, and several of the buildings are very handsome. It is the seat of the large State penitentiary. The commercial interests of the city are fostered by its position on no fewer than six railways; and its manufactures are assisted by the water power, afforded by the river, which flows through the town, and is spanned by an iron bridge. Jackson manufactures fire-clay goods, railway and other carriages, chemicals, agricultural implements, etc., and has foundries, planing-mills, and flour-mills. The presence of bituminous coal in the neighborhood affords additional stimulus to trade; and the surrounding country is fertile. A business college and a system of graded schools are among the educational resources of the city. Population in 1870, 11,447; in 1880, 16,105.

JACKSON, capital of the State of Mississippi, U.S., and chief city of Hinds county, is pleasantly situated on the right bank of the Pearl river, about 180 miles north of New Orleans, with which it is connected by rail. The city is fairly well built; the chief buildings are the State capitol, the State penitentiary, and the institutions for the blind and for the deaf and dumb. One mile distant is the lunatic asylum. There are several good schools, and a State library of 15,000 volumes. The chief trade is in cotton, the average export being about 30,000 bales a year. Foundries and a factory for sashes and doors are among the manufactories of the place. Population in 1870, 4234; in 1880, 5205.

JACKSON, chief city of Madison county, Tennessee, U.S., is situated on the Forked Deer river, about 70 miles north-east of Memphis. Its chief trade is in cotton, of which many thousand bales are exported annually. Jackson has flour and planing mills, and manufactories of railway and other carriages, besides smaller industries. Of its several educational institutions the chief is West Tennessee college, founded in 1844, which had in 1874–75 four professors and one hundred students. The Southwestern Baptist university was opened in 1875. The population in 1880 numbered 5371.

JACKSON, ANDREW (1767–1845), seventh president of the United States, was born March 15, 1767, at the Waxhaw or Warsaw settlement (whose position in relation to the later boundaries of North and South Carolina is unknown), whither his parents had immigrated from Carrickfergus in Ireland in 1765. Jackson had no regular education. He had some slight share in the war of independence, and was taken prisoner in 1781. He studied law at Salisbury, North Carolina, and was admitted to the bar and began to practise at Nashville in Tennessee. In 1791, on the first incorrect report that Mrs. Rachel Robards (*née* Donelson) had succeeded in getting a divorce bill from her husband passed in Virginia, Jackson married her: when, later, it was passed, they were remarried. In 1796 Jackson assisted to frame the constitution of Tennessee, and represented that State in the federal congress, where he distinguished himself as an irreconcilable opponent of Washington. In 1797 he was elected a United States senator; but he resigned the following year. He was judge of the supreme court of Tennessee from 1798 to 1804. In 1804–5 he contracted a friendship with Burr; and at the latter's trial in 1807 Jackson was one of his conspicuous champions. Up to the time of his nomination for the presidency, the biographer of Jackson finds nothing to record but military exploits, in which he displayed perseverance, energy, and skill of a very high order, and a succession of personal acts in which he showed himself ignorant, violent, perverse, quarrelsome, and astonishingly indiscreet. In 1806 he killed Charles Dickinson in a duel. In 1813, as a major-general of militia, he commanded in the campaign against the Creek Indians in Georgia and Alabama, and there first attracted public notice by his talents. In May, 1814, he was commissioned as major-general in the regular army to serve against the English; in November he captured Pensacola, used by the English as a base of operations; and on January 8, 1815, he inflicted a severe defeat on the enemy before New Orleans. During his stay in New Orleans, he declared martial law, and carried out his measures with unrelenting sternness, banishing from the town a judge who attempted resistance. When civil law was restored, Jackson was fined $1000 for contempt of court; in 1844 congress ordered the fine with interest ($2700) to be repaid. In 1818 Jackson received the command against the Seminoles. His conduct in following them up into the Spanish territory of Florida gave rise to much hostile comment in the cabinet and in congress; but the negotiations for the purchase of Florida put an end to the diplomatic question. In 1821 Jackson was appointed military governor of Florida, and there again he came into collision with the civil authority. From this, as from the previous troubles, J. Quincy Adams extricated him.

In August, 1822, the house of representatives of Tennessee nominated Jackson for president; and in 1823 he was elected to the senate at Washington. The rival candidates for the office of president were Adams, Crawford, and Clay. Jackson obtained the largest number of votes in the electoral college; but no one had an absolute majority. At the election by the house of representatives (February 9, 1825) Adams was chosen. Jackson, however, was recognized by the abler politicians as the coming man; Van Buren and others, going into opposition under his banner, waged from the first a relentless and factious war on the administration. Van Buren was the most adroit politician of his time; and Jackson was in the hands of very astute men, who advised and controlled him. He was easy to lead when his mind was in solution; and he gave his confidence freely where he had once placed it. He was not suspicious, but if he withdrew his confidence he was implacable. When his mind crystallized on a notion that had a personal significance to himself, that notion became a hard fact that filled his field of vision. When he was told that he had been cheated in the matter of the presidency, he was sure of it, although those who told him were by no means so.

There was great significance in the election of Jackson in 1828. A new generation was growing up under new economic and social conditions. They felt great confidence in themselves, and great independence. They despised tradition and Old World ways and notions; and they accepted the Jeffersonian dogmas, not only as maxims, but as social forces—the causes of the material prosperity of the country. By this generation, therefore, Jackson was recognized as a man after their own heart. They liked him because he was vigorous, brusque, uncouth, relentless, straightforward, and open. They made him president in 1828, and he fulfilled all their expectations. He had 178 votes in the electoral college against 83 given for Adams. Though the work of redistribution of offices began almost at his inauguration, it is yet an incorrect account of the matter to say that Jackson corrupted the civil service. His administration is rather the date at which a system of democracy, organized by the use of patronage, was introduced into the federal arena by Van Buren. The administration had two parties in it from the first, Van Buren's and Calhoun's, and the president's interference in a purely private matter brought about a rupture. In April, 1831, the whole cabinet resigned; Jackson and Calhoun quarrelled; and the former transferred to Van Buren his support for succession in the presidency.

In 1832 Jackson was re-elected by a large majority over Clay, his chief opponent. The battle raged mainly around the re-charter of the bank of the United States. It is probable that Jackson's advisers in 1828 had told him, though erroneously, that the bank had worked against him, and then were not able to control him. The first message of his first presidency had contained a severe reflection on the bank; and in the very height of this second campaign (July, 1832) he vetoed the re-charter, which had been passed in the session of 1831–32. Jackson interpreted his re-election as an approval by the people of his war on the bank; and after the exciting episode of South Carolina's opposition to the tariff rates he pushed it with energy. In September, 1833, he ordered the public deposits in the bank to be transferred to selected local banks, and entered upon the "experiment" whether these could not act as fiscal agents for the Government, and whether the desire to get the deposits would not induce them to adopt sound rules of currency. During the next session the senate passed a resolution condemning his conduct. Jackson protested, and after a hard struggle the resolution was ordered to be expunged from the record, January 16, 1837.

Jackson was very successful in collecting old claims against various European nations, for spoliations inflicted under Napoleon's continental system. Aiming at a currency consisting largely of specie, he caused the payment of these claims to be received and imported in specie as far as possible; and in 1836 he ordered land-agents to receive for land nothing but specie. About the same time a law passed congress for distributing among the States some $35,000,000 balance belonging to the United States, the public debt having all been paid. The eighty banks of deposit in which it was lying had regarded this sum almost as a permanent loan, and had inflated credit on the basis of it. The necessary calling in of their loans in order to meet the drafts in favor of the States, combining with the breach of the overstrained credit between America and Europe and the decline in the price of cotton, brought about a crash which prostrated the whole financial, industrial, and commercial system of the country for six or seven years. The crash came just as Jackson was leaving office; the whole burden fell on his successor, Van Buren.

Jackson is the only president of whom it may be said that he went out of office far more popular than he was when he entered. When he went into office he had no political opinions, only some popular notions. He left his party strong, perfectly organized, and enthusiastic on a platform of low expenditure, payment of the debt, no expenditure for public improvement or for glory and display in any form, and low taxes. His name still remained a spell to conjure with, and the politicians sought to obtain the assistance of his approval for their schemes; but in general his last years were quiet and uneventful. He died near Nashville, June 8, 1845.

Biographies of Jackson have been written by J. H. Eaton, 1824; William Cobbett, 1834; Amos Kendall, 1844; and James Parton, 3 vols., 1860. (W. G. S.)

JACKSON, Thomas Jonathan (1824–1863), "Stonewall Jackson," a distinguished Confederate general in the American civil war, was born in Harrison county, Virginia, 21st January, 1824, and came of that Scotch-Irish stock to whose hardy virtues the middle states of America are largely indebted for the pure and resolute virtues of their people. His early education was only such as could be furnished by an obscure country school. Thence he passed to West Point military academy, where, though he was at first impeded by his meagre acquirements, his indomitable courage and conscientious diligence eventually raised him to a foremost place. At West Point he exhibited the qualities by which he was distinguished in the splendor of his career,—courage, patience, constancy of purpose, inflexible fidelity to duty, and an artless simplicity of character which engaged instant and universal confidence. Graduating at twenty-two, he was appointed lieutenant of artillery in the army of the United States, and participated, with distinction, in several of the most important battles in Mexico. After the war he resigned his commission, and accepted the professorship of natural philosophy in the Virginia military institute at Lexington, a position which he held until the outbreak of hostilities between the Union and the Confederate States. During his sojourn at Lexington, he entered the Presbyterian communion, and was remarkable ever after for the fervor of his religious devotion. In political discussions or agitations, Major Jackson—such was his title by brevet—had never engaged; but in principle and by profession he was a State-right Democrat of the Virginia school; in other words, he maintained the legitimacy of negro slavery and the sovereign right of a State to withdraw from the Union, and therefore to the secession movement of 1861 he at once accorded his sympathy. On the organization of the Virginia troops he was commissioned colonel of infantry, by Governor Letcher, who, long intimate with him, adequately appreciated his yet undisclosed military genius.

Jackson's first exploit in the war of secession was the capture, on May 3, 1861, of the Federal arsenal at Harper's Ferry. Soon afterwards he received the command of a brigade—the brigade which, by its immovable fortitude at Bull Run, turned the tide of battle in that long doubtful struggle, and, from the admiration of its comrades, extorted for itself and its chief the now historic name of "Stonewall."

Detached from the army at Manassas for separate service in the Shenandoah Valley, Jackson soon signalized his genius for war. Placing himself between the converging columns of Shields, Milroy, and Banks, he struck one after the other; and, with a force inferior to his adversaries separately, he eventually drove them back upon Washington in utter defeat. In this "campaign of the valley" Jackson displayed true military instinct and the highest military art. By vigilance, sagacity, celerity and secrecy of movement, and faultless tactical skill on the field of battle, he achieved the greatest possible results with the smallest possible means. His reputation was now fixed in the estimation alike of friend and foe; and, while the Confederate States were filled with the renown of his achievements, the Federal forces were in constant terror of his prowess. Having stayed the invasion of Virginia along the line of the valley, Jackson repaired to Richmond to concert with Lee the deliverance of the Confederate capital, then closely pressed by McClellan. Appointed, meanwhile, to the command of a corps, he suddenly revealed himself on the right flank of the Federal army at Mechanicsville; and in a series of desperately fought engagements he routed the besieging army, and drove McClellan to shelter at Harrison's Landing. Richmond relieved, Jackson, without pause, hastened to confront Pope, who was menacing the city from the north. In the battle of Cedar Run he inflicted signal defeat upon that general, and compelled him to retrace his steps across the Rappahannock.

Reinforced by McClellan's army and fresh troops from the northern States, Pope made a stand at Manassas; but in the second battle on that field he suffered an overthrow as decisive as that sustained by McDowell in the first fight at Bull Run. As usual Jackson's corps bore the brunt of the battle; and as usual to his skill and courage the Confederate army was mainly indebted for its success. Following up the victory by the invasion of Maryland, Lee detached Jackson for an attack on Harper's Ferry, again in the hands of the Federalists, and garrisoned by 12,000 troops. In a few days the surrender of the place, with all its force and munitions of war, was announced to Lee, who, slowly retiring before McClellan, anxiously expected the arrival of Jackson, that he might turn and crush his pursuer. But before he could effect the desired junction Lee was brought to bay at Antietam, and compelled to accept battle under every disadvantage. Jackson now arrived, however, with two of his divisions, and his presence not only averted an otherwise inevitable disaster, but rescued the Confederate army from the destruction which awaited it if defeated with its rear resting on the river. Henceforth Jackson's operations were under the immediate eye and command of Lee; and, while at Fredericksburg and Chancellorsville his gallantry was as conspicuous as ever, to his illustrious chief belongs the glory of those hard-fought battles.

On the afternoon of May 2, 1863, Jackson fought his last battle. Executing a plan of his own conception, he suddenly struck the flank of the 11th Federal corps, and drove it pell-mell before him. Night fell with the hostile forces in close proximity; and, while Jackson was making a reconnoissance with a view to pressing the pursuit, he was fired on in the dark by men of his own command, and received wounds of which he died on May 10, 1863. His death smote the Confederates with a pang of unspeakable anguish. The fall of their foremost chieftain was bewailed as the omen of the fall of the party.

In deportment Jackson was grave and measured; but he relaxed on approach, and his address was bland and gracious. In conversation he conveyed the impression of a frank, firm character, and of an intellect clear and direct, but in no wise of superior order. No opinion floated languidly in his understanding; he held all his beliefs with an intense earnestness of conviction, and he was prompt and resolute in carrying his convictions into action. He engaged in the war of secession with an unfaltering faith in the justice of the cause and an unhesitating persuasion of its triumph. He was the idol of his troops. At his command they would cheerfully endure any sacrifice or confront any peril. On the field of battle he was never known to lose his self-possession, or to be surprised by any fluctuation of fortune; his quick eye would detect the exigent moment, and his unerring judgment direct the decisive manœuvre. (R. A. P.*)

JACKSON, William (1730–1803), an English musician of repute, was born at Exeter, in May, 1730. His father, a grocer, bestowed a liberal education upon him, but, on account of the lad's strong predilection for music, was induced to place him under the care of John Silvester, the organist of Exeter Cathedral, with whom he remained about two years. In 1748 he went to London, and studied under John Travers, organist of the king's chapel. Returning to Exeter, he settled there as a teacher and composer, and in 1777 was appointed subchanter, organist, lay-vicar, and master of the choristers of the cathedral. In 1755 he published his first work, *Twelve Songs*, which became at once highly popular. His next publication, *Six Sonatas for the Harpsichord*, was a failure. His third work, *Six Elegies for three voices, preceded by an Invocation, with an Accompaniment*, was very successful, and placed him among the first composers of his day. Dr. Burney considered these as the best of Jackson's works, and added that "no composer copied less from others than Jackson." His fourth work was another set of *Twelve Songs*, now very scarce; and his fifth work was again a set of *Twelve Songs*, all of which are now forgotten. He next published *Twelve Hymns*, with some good remarks upon that style of composition, although his precepts were better than his practice. A set of *Twelve Songs* followed, containing some good compositions. Next came an *Ode to Fancy*, the words by Dr. Warton. *Twelve Canzonets for two voices* formed his ninth work; and one of them—"Time has not thinned my Flowing Hair"—long held a place at public and private concerts. His tenth work was *Eight Sonatas for the Harpsichord*, some of which were novel and pleasing. He composed three dramatic pieces,—*Lycidas* (1767), *The Lord of the Manor* to General Burgoyne's words (1780), and *The Metamorphoses*, a comic opera produced at Drury Lane in 1783, which did not succeed. In the second of these dramatic works, two airs—"Encompassed in an Angel's Form" and "When first this Humble Roof I knew"—were great favorites. Some of his church music, published after his death, did not please the critics. In 1782 he published *Thirty Letters on Various Subjects*, which are well written and interesting. In these he severely attacked canons, and described William Bird's *Non nobis Domine* as containing passages not to be endured. But his anger and contempt were most strongly expressed against catches of all kinds, which he denounced as barbarous. In 1791 he put forth a pamphlet, *Observations on the Present State of Music in London*, in which he found fault with everything and everybody. He published in 1798 *The Four Ages, together with Essays on Various Subjects*,—a work which gives a favorable idea of his character and of his literary acquirements. It appears that he cultivated a taste for landscape painting, and imitated, not unsuccessfully, the style of his friend Gainsborough. He died July 12, 1803.

JACKSONVILLE, the chief city in Duval county, Florida, U.S., and the largest in the State, is situated on the west bank of the St. John's river, 25 miles from the sea. The city is regularly built. The streets, many of which are pleasantly shaded with trees, are laid out on the common American rectangular system. Jacksonville exports very large quantities of lumber, besides fruit, cotton, sugar, and fish, and carries on a coasting trade with Charleston, Savannah, and St. Augustine. The fine salubrious climate attracts numerous visitors and invalids from the northern States. Jacksonville, which owes its name to President Jackson, was laid out as a town in 1822. In 1880 its population was 7650.

JACKSONVILLE, the chief city of Morgan county, Illinois, U.S., on Mauvaiseterre Creek, a tributary of the Illinois river, is situated at the intersection of several railways, about 200 miles S.S.W. of Chicago. Its streets are wide and generally well shaded. The public buildings include State institutions for the blind, the feeble-minded, the deaf and dumb, and the insane. Among the educational institutions, which are numerous, are Illinois College, three colleges for women, and a conservatory of music. There is also a free library, with reading-room. The population in 1880 was 10,928.

JACOB (יַעֲקֹב or יַעֲקוֹב, derived according to Gen. xxv. 26, xxvii. 36, from עקב, and meaning "one who seizes the heel" or "supplants"), the younger son of Isaac and Rebekah, and the father of the twelve patriarchs. According to the Elohistic (Levitical) narrative in Genesis, he was born in the land of Canaan when his father was sixty years of age. After Esau, his twin brother, at the age of forty years had married two Hittite wives, Isaac at the instigation of Rebekah sent Jacob with his blessing to Padan Aram, there to seek a wife in the family of his maternal uncle Laban. Arrived at his destination, he married Rachel (to whom Bilhah was given as a maidservant); the same narrative implies also his union with Leah (whose maid was Zilpah). Before he left Padan Aram he had become the father of twelve sons, including Benjamin (Gen. xxxv. 23–26). On his return, with the property he had acquired, to his father Isaac in Canaan (xxxi. 18), God met him and blessed him and changed his name from Jacob to Israel; the place where this occurred was called by him Bethel (xxxv. 9–13, xxxv. 15). In the course of a further migration southwards, Rachel died at a point not far from Ephrath (Bethlehem); finally Mamre, near Kirjath Arba (Hebron), where Isaac was living, was reached, and a permanent settlement appears to have been made until the death of Isaac there at the age of one hundred and eighty years. The subsequent migration of Jacob to Egypt with his household of seventy souls is then briefly indicated, and his hospitable reception as an old man of one hundred and thirty by Pharaoh. A residence was assigned to the colony in the best part of the land, the land of Rameses, by Joseph, and here the Israelites prospered much and rapidly increased. Seventeen years after the interview with Pharaoh the patriarch died, after having blessed his sons and particularly Joseph, whose two sons Ephraim and Manasseh he put upon a level with Reuben and Simeon. He was buried by his family, according to his own desire, in the cave of Machpelah, fronting Mamre, in the land of Canaan. The combined parallel narrative of the Jehovist and the other (elder) Elohist is much fuller, and in some points not easily to be reconciled with the preceding account. Various circumstances connected with the birth of the twins Isaac and Jacob are detailed; the partiality of Isaac for the elder and of Rebekah for the younger is indicated; Jacob's departure from Canaan is represented as a flight necessitated by his fraudulent conduct towards Isaac and Esau with reference to the blessing of the former; a revelation received at Bethel in the course of this flight is described; many minute particulars of his domestic life at Padan Aram and of his relations with Laban his uncle and father-in-law are given; the scene of the change of name is placed at Peniel, where he wrestled with the angel (see Hos. xii. 5); a period of residence at Shechem is mentioned; the death of Rachel at Ephrath is said to have happened in childbed; after having fixed his home successively at Hebron and Beersheba, he is ultimately led by circumstances, which are described with much fullness and vividness, to migrate to Egypt, where he dies. Consideration of the relations of these parallel narratives may be postponed to the article PENTATEUCH. As to the interpretation of the history of Jacob, it is now usual to regard it as having an ethnological at least quite as much as a personal significance; but none of the attempts hitherto made to mythologize it (as by Popper, who sees in the wrestling Jacob the Asiatic Hercules, Melicertes, Palæmon) can be regarded as even plausible.

JACOBÁBÁD, a municipality and the chief town of the frontier district of Upper Sind, India, is situated in 28° 17′ N. lat. and 68° 28′ 45″ E. long. Laid out in 1847 by General John Jacob, on the site of the village of Khangarh, it is now the headquarters of the large military force of the Upper Sind frontier, and also of the local civil administration. It contains therefore a considerable European population, and possesses all the usual public offices and institutions of an important station. In addition to the cantonments, civil and judicial courts, dispensary, jail, post and telegraph offices, etc., it has also a "residency," and lines for the accommodation of trade caravans (*káfilas*) from Central Asia. The civil court, which is under the Shikárpur jurisdiction, was established in 1870, the sessions judge of Shikárpur visiting it twice a year. Population, including the military camp, 10,954.

JACOBI, FRIEDRICH HEINRICH (1743–1819), a distinguished writer on philosophy, was born at Düsseldorf on the 25th of January, 1743. The second son of a wealthy merchant, who owned an extensive sugar factory near Düsseldorf, he was educated for a commercial career, partly in his native place, partly at Frankfort-on-the-Main. At the age of sixteen he was sent to complete his training at Geneva, where he remained for four years. Of a retiring disposition, and far more inclined to thoughtful meditation than to practical activity, Jacobi mainly associated himself at Geneva with the literary and scientific circle of which the most prominent member was Lesage. He studied closely the works of Bonnet, the Swiss naturalist and metaphysician, and was brought into contact with the new political ideas of Rousseau and Voltaire. In 1763 he was called back to Düsseldorf, and in the following year he married and took his place at the head of the mercantile concern handed over to him by his father. After a short period he gave up his commercial career, and in 1770 became a member of the council for the duchies of Juliers and Berg, in which capacity he distinguished himself by his ability in the management of financial affairs, and his zeal in the direction of social reforms. Like his contemporary Hemsterhuis, whom he resembles in many points, Jacobi kept up his interest in literary and philosophic matters by an extensive correspondence, and his mansion at Pempelfort, near Düsseldorf, was the centre of a distinguished literary circle. With Wieland he contributed to start a new literary journal, the *Mercury*, in which some of his earliest writings, mainly on practical or economical subjects, were published. Here too appeared in part the first of his philosophic works, the *Correspondence of Allwill* (*Allwill's Brief Sammlung*, 1774), a combination of romance with speculation, containing a remarkable delineation of that which we may call the principle of the early romantic school in Germany. This was followed in 1779 by *Woldemar*, a philosophic novel, a very imperfect structure, but full of genial speculation, and giving the most complete picture of Jacobi's method of philosophizing. In 1779 he was invited to Munich as member of the privy council, but after a short stay there differences with his colleagues and with the authorities of Bavaria drove him back to Pempelfort. A few unimportant tracts on questions of theoretical politics were followed in 1785 by the work which first brought Jacobi directly into relation with the contemporary philosophical public. A conversation which he had held with Lessing in 1780, in which Lessing avowed that he knew no philosophy, in the true sense of that word, save Spinozism, led him to a protracted study of Spinoza's works, while his statement of Lessing's confession induced a correspondence with Moses Mendelssohn. The *Letters on Spinoza's Theory* (*Briefe über die Lehre Spinoza's*, 1785; 2d ed., much enlarged and with important *Appendices*, 1789) expressed sharply and clearly Jacobi's strenuous objection to a demonstrative system in philosophy, and drew upon him the vigorous enmity of the Berlin clique, whose philosophic protagonist was Moses Mendelssohn. Jacobi was ridiculed as endeavoring to reintroduce into philosophy the antiquated notion of unreasoning belief, was denounced as an enemy of reason, as a pietist, and as in all probability a Jesuit in disguise, and was especially taken to task for his employment of the ambiguous term "belief" (*Glaube*, which may mean *belief* in the ordinary sense, or *faith* in the specifically theological significance). Mendelssohn's reply showed little more than the writer's very slight acquaintance with the Spinozistic system to which he had so frequently and so earnestly appealed, and his mortification at the public disclosure of the fact that he had remained in entire ignorance that Spinoza's *Opera Posthuma* contained the *Ethics* is said to have hastened his death.

Jacobi's next important work, *David Hume on Belief, or Idealism and Realism*, a dialogue (*David Hume über den Glauben, oder Idealismus und Realismus*, 1785), was an attempt to show not only that the term *Glaube* had been used by the most eminent writers to denote what he had employed it for in the *Letters on Spinoza*, but that the nature of the cognition of facts as opposed to the construction of inferences could not be otherwise expressed. In this writing, and especially in the *Appendix*, Jacobi came into contact with the critical philosophy, and subjected the Kantian view of knowledge to searching examination.

The outbreak of the war with the French republic induced Jacobi in 1793 to leave his home at Düsseldorf, and for nearly ten years he resided in Holstein. While there he became intimately acquainted with Reinhold, in whose *Beiträge*, pt. iii., 1801, his important work *On the Endeavor of the Critical Philosophy to bring Reason to Understanding* was first published, and with Matthias Claudius, the author of the *Wandsbecker Bote*. During the same period the excitement caused by the accusation of atheism brought against Fichte at Jena led to the publication of Jacobi's *Letter to Fichte*, in which he made more precise the relation of his own philosophic principles to theology.

Soon after his return to Germany, Jacobi received a call to Munich in connexion with the new academy of sciences just founded there. The loss of a considerable portion of his fortune induced him to accept this offer; he settled in Munich in 1804, and in 1807 became president of the academy. In 1811 appeared his last philosophic work, directed against Schelling specially, *On Divine Things* (*Von den göttlichen Dingen*), the first part of which, a review of the *Wandsbecker Bote*, had been written in 1798. A bitter reply from Schelling was left without answer by Jacobi, but gave rise to an animated controversy in which Fries and Baader took prominent part. In 1812 Jacobi retired from the office of president, and began to prepare a collected edition of his works. He died before this was completed, on 10th March, 1819. The edition of his writings was continued by his friend Köppen, and was completed in 1825. The works fill six volumes, of which the fourth is in three parts. To the second is prefixed an introduction by Jacobi, which is at the same time an introduction to his philosophy. The fourth volume has also an important preface.

The philosophy of Jacobi presents itself as in no way a system,—indeed, as, from its principle, essentially unsystematic. A certain fundamental view which underlies all his thinking is brought to bear in succession upon those systematic doctrines which appear to stand most sharply in contradiction to it, and any positive philosophic results are given only occasionally. The leading idea of the whole is that of the complete separation between understanding and apprehension of real fact. For Jacobi understanding, or the logical faculty, is purely formal or elaborative, and its results never transcend the given material supplied to it. From the basis of immediate experience or perception thought proceeds by comparison and abstraction, establishing connections among facts, but remaining in its nature mediate and finite. The principle of reason and consequent, the necessity of thinking each given fact of perception as conditioned, impels understanding towards an endless series of identical propositions, the records of successive comparisons and abstractions. The province of the understanding is therefore strictly the region of the conditioned; to it the world must present itself as a mechanism. If, then, there is objective truth at all, the existence of real facts must be made known to us otherwise than through the logical faculty of thought; and, as the regress from conclusion to premises must depend upon something not itself capable of logical grounding, mediate thought implies the consciousness of immediate truth. Philosophy therefore must resign the hopeless ideal of a systematic (*i. e.*, intelligible) explanation of things, and must content itself with the examination of the facts of consciousness. It is a mere prejudice of philosophic thinkers, a prejudice which has descended from Aristotle, that mediate or demonstrated cognition is superior in cogency and value to the immediate perception of truths or facts.

The fundamental principle of Jacobi's system, thus sketched, presents a most interesting analogy with that which has become familiar in English philosophy through the writings of Sir W. Hamilton. Upon the historical relations between the two thinkers nothing requires here to be said. No reader of Hamilton can fail to be made aware of the great obligations the Scotch psychologist was under to his German predecessor. But attention to the results of Jacobi's fundamental doctrine, as these were wrought out by comparison of it with the speculative systems of Spinoza, Kant, and Schelling, will throw great light upon Hamilton's writings, and make clear the connections of the several parts which in his imperfect expositions too frequently remained in obscurity.

As Jacobi starts with the doctrine that thought is partial and limited, applicable only to connect facts, but incapable of explaining their existence, it is evident that for him any demonstrative system of metaphysic which should attempt to subject all existence to the principle of logical ground must be repulsive. Now in modern philosophy the first and greatest demonstrative system of metaphysic is that of Spinoza, and it lay in the nature of things that upon Spinoza's system Jacobi should first direct his criticism. A summary of the results of his examination is thus presented (*Werke*, i. 216–223):—"(1) Spinozism is atheism; (2) the Kabbalistic philosophy, in so far as it is philosophy, is nothing but undeveloped or confused Spinozism; (3) the philosophy of Leibnitz and Wolff is not less fatalistic than that of Spinoza, and carries a resolute thinker to the very principles of Spinoza; (4) every demonstrative method ends in fatalism; (5) we can demonstrate only similarities (agreements, truths conditionally necessary), proceeding always in identical propositions; every proof presupposes something already proved, the principle of which is immediately given (*Offenbarung*, revelation, is the term here employed by Jacobi, as by many later writers, *e. g.*, Lotze, to denote the peculiar character of an immediate, unproved truth); (6) the keystone (*Element*) of all human knowledge and activity is belief (*Glaube*). Of these propositions only the first and fourth require further notice. Jacobi, accepting the law of reason and consequent as the fundamental rule of demonstrative reasoning, and as the rule explicitly followed by Spinoza, points out that if we proceed by applying this principle so as to recede from particular and qualified facts to the more general and abstract conditions, we land ourselves, not in the notion of an active, intelligent creator of the system of things, but in the notion of an all-comprehensive indeterminate *Nature*, devoid of will or intelligence. Our unconditioned is either a pure *abstraction*, or else the impossible notion of a completed system of conditions. In either case the result is atheism, and this result is necessary if the demonstrative method, the method of understanding, is regarded as the only possible means of knowledge. Moreover, the same method inevitably lands in fatalism. For, if the action of the human will is to be made intelligible to understanding, it must be thought as a conditioned phenomenon, having its sufficient ground in preceding circumstances, and, in ultimate abstraction, as the outflow from nature which is the sum of conditions. But this is the fatalist conception, and any philosophy which accepts the law of reason and consequent as the essence of understanding is fatalistic. Thus for the scientific understanding there can be no God and no liberty. It is impossible that there should be a God, for if so he would of necessity be finite. But a finite God, a God that is *known*, is no God. It is impossible that there should be liberty, for if so the mechanical order of phenomena, by means of which they are comprehensible, would be disturbed, and we should have an unintelligible world, coupled with the requirement that it shall be understood.

Cognition, then, in the strict sense, occupies the middle place between sense perception, which is belief in matters of sense, and reason, which is belief in supersensuous fact. (Jacobi wavered much in his terminology, especially with respect to the word reason; but even at this stage of his thinking the distinctions just named are sufficiently apparent.) Such a view, and especially the fundamental peculiarity that the categories of the understanding are to be regarded as mere forms of the conditioned, from their very nature limited and relative, presented a certain analogy to the critical philosophy, and accordingly, in the second period of Jacobi's speculative development, he is driven to a comparison of his doctrines with those of Kant.

His adverse criticism of the Kantian doctrines was directed on three points mainly, and though in itself but ill-founded, it deserves the careful consideration of all Kantian students. (1) The categories of the understanding and the forms of intuition supply a blank scheme for the given element of sense. But if the given element be merely sensation, and not actually the external thing, we are still, Jacobi thinks, within the position of subjective idealism. At no point in the whole process do we ever get beyond empty form, bare identity. The synthetical unity of consciousness, if no reality be supplied in regard to which it may operate, is mere repetition of the form of conjunction, mere *possibility* of cognition. Whence do we obtain the reality, the *objectivity*, of knowledge? To Jacobi it seemed that Kant, in the second edition of the *Kritik*, made an effort to demonstrate the external reality of phenomena of experience, and he views the change in Kant's doctrine as the effect of his own critical comments. Nevertheless such demonstration still seems to him unsatisfactory; it yields only the thought-form of externality, not externality in fact. (2) Jacobi agrees with Kant so far as the critical view of the incapacity of understanding to encompass the ideas is concerned, but he thinks Kant in error in supposing that such incapacity results from the subjective limitation of our power of thinking and not from the nature of the categories of understanding in themselves. At the same time he holds that Kant treats the ideas unjustly, and that in his view of reason he tends to make that faculty inferior to understanding. (3) Kant's moral theory is as little satisfactory as his theory of perception. Here, too, in the demand for universally valid law as the law of a will that is its own content, Jacobi can find but the form and not the reality of a universal rule. The universal will is void of content, and the sharp opposition which in the Kantian ethics appears between the ethical motive and all modes of feeling is the natural result of mere formalism. When Jacobi endeavors to supply the place of the Kantian theorems which he rejects, the inherent weakness of his own principle becomes apparent. External things are known to us by immediate perception, a combination of intuition and belief. The principle of inference to realities is that of cause and effect, the significance of which we learn from observing the relation between our will and changes in the objective world, and this principle by a natural necessity we extend to all existence. The infinite progress from consequents to grounds, which is the form of procedure of understanding, yields no conclusion as regards the being of a God. But when we regard the whole system of real things, we are compelled to infer a real cause, which, from the significance of the causal principle, is seen to be of necessity an active intelligent will, a God who foresees events. This apprehension of God is faith, reason, or feeling, as Jacobi, following Fries, is willing to call it.

Not even in his latest work of importance (*Von den göttlichen Dingen*), which is specifically on religion, does Jacobi manage to make clear the step, which he has himself characterized as the *salto mortale* of the human intellect, from the finite to the infinite; still less the further difficulty as to the possibility of holding that the God who for cognition is the unknown God must be held to possess providence, personality, life. He acknowledges that this is anthropomorphic, bitterly assails Schelling for identifying divine and human reason, but leaves the problem standing. The truth is that what Jacobi called feeling, and regarded as immediate knowledge, is not a simple act of mind, capable of yielding simple results, but the very essence of complex thinking. We cannot separate knowledge of things from apprehension of them in the way he has adopted. Nor can the human reason rest satisfied with a system devoid of inner coherence and harmony.

The best introductions to Jacobi's philosophy are the preface to the second vol. of the *Works*, and Appendix 7 to the *Letters on Spinoza's Theory*. There are two monographs of some extent upon him:—Kuhn, *Jacobi und die Philosophie seiner Zeit*, 1834; and Zirngiebl, *F. H. Jacobi's Leben, Dichten, und Denken*, 1867. See also *F. H. Jacobi's Auserlesener Briefwechsel*, 2d ed., by Roth, 2 vols., 1825-27; and Gildemeister's edition of Hamann's *Schriften*, vol. v. (R. AD.)

JACOBI, Karl Gustav Jacob (1804-1851), one of the great mathematicians of the present century, was born at Potsdam, of Jewish parentage, December 10, 1804. He studied at Berlin university, where he obtained the degree of doctor of philosophy in 1825, his thesis being an analytical discussion of the theory of fractions. In 1827 he became "extraordinary" and in 1829 "ordinary" professor of mathematics at Königsberg; and this chair he filled till 1842, when he visited Italy for a few months to recruit his health. On his return he removed to Berlin, where he lived as a royal pensioner till his death, February 18, 1851. His investigations in elliptic functions, the theory of which he established upon quite a new basis, and more particularly his development of the Theta-function, as given in his great treatise *Fundamenta Nova Theoriæ Functionum Ellipticarum* (Königsberg, 1829), and in later papers in *Crelle's Journal*, constitute his grandest analytical discoveries. Second in importance only to these are his researches in differential equations, notably the theory of the last multiplier, which is fully treated in his *Vorlesungen über Dynamik*, edited by Clebsch (Berlin, 1866). It was in analytical development that Jacobi's peculiar power mainly lay, and he made many important contributions of this kind to other departments of mathematics, as a glance at the long list of papers that were published by him in *Crelle's Journal* from 1826 onwards will sufficiently indicate. Thus he was one of the early founders of the theory of determinants; in particular, he invented the functional determinant formed of the n^2 differential coefficients of n given functions of n independent variables, which now bears his name (Jacobian), and which has played an important part in many analytical investigations. Valuable also are his papers on Abelian transcendents, and his investigations in the theory of numbers, in which latter department he mainly supplements the labors of Gauss, with whom as with the other great Continental mathematicians of the day, Legendre, Bessel, Abel, etc., he was on terms of the closest intimacy. The planetary theory and other particular dynamical problems likewise occupied his attention from time to time. He left a vast store of manuscript, portions of which have been published at intervals in *Crelle's Journal*. See Infinitesimal Calculus.

JACOBITE CHURCH, an ecclesiastical organization thinly spread over Syria, Mesopotamia, and Babylonia, having for its distinctive doctrinal principle the Monophysite thesis with regard to the person of Christ; it consequently accepts the decrees of the second ("Robber") synod of Ephesus, and rejects those of the council of Chalcedon. It has some minor peculiarities in points of detail,—for example, as to the preparation of the communion elements, the mode of making the sign of the cross, and the method of electing patriarchs and bishops. Its head is called the patriarch of Antioch, who has his residence, however, for the most part at Diarbekir; second to him is the "maphrian" (*i. e.*, "fertilizer"), who has a kind of primacy over the eastern section of the church. No accurate statistics as to the numerical strength of the Jacobite Church exist; its numbers may probably be safely placed considerably under 250,000. For a considerable time a Roman Catholic patriarch of the Jacobites has resided at Aleppo, and lately the Jacobites of Damascus have accepted Catholicism. The Jacobite Church owes its origin, as its name, to Jacobus, surnamed Baradæus and sometimes Zanzalus, a native of Tella, who became a monk at Constantinople, and afterwards receiving episcopal consecration (541 or 543 A.D.) devoted thenceforward the rest of his life (nearly forty years) to extensive labors throughout Asia Minor, Syria, Egypt, and the Mediterranean islands, on behalf of the Monophysite cause. Such were his energy and zeal that he is said to have consecrated in the course of his travels no fewer than two patriarchs, twenty-seven bishops, and fully 100,000 priests and deacons. The epithet "Jacobite" is sometimes applied with less strict propriety to the Coptic, Abyssinian, and Armenian Churches, which also are Monophysite, and owe much to the influence of Baradæus.

JACOBS, Christian Friedrich Wilhelm (1764-1847), a German scholar and author, was born at Gotha, October 6, 1764. After studying philology and theology at Jena and Göttingen, he in 1785 became teacher in the gymnasium of his native town, and in 1802 was appointed to an office in the public library. In 1807 he became classical teacher in the lyceum of Munich, but he again returned to Gotha in 1810 to take the charge of the library and the numismatic cabinet. From 1831 to 1842 he was superintendent of the art collections of the town. He died at Gotha, March 30, 1847.

Jacobs, besides editing a large number of the less known Greek and Latin authors, was a voluminous translator and also a successful writer in various departments of general literature. Of his editorial labors the most important is the edition of the *Anthologia Græca*, 13 vols., 1794-1814. He also published translations from the Greek Anthology under the title *Tempe*, 2 vols., 1803. His *Elementarbuch der griechischen Sprache*, 1805, has gone through many editions. His miscellaneous essays on classical subjects were published collectively at various periods under the title *Vermischte Schriften*, and amount in all to 8 volumes. Among his other writings may be mentioned *Schriften für die Jugend*, 3 vols., 1842-44; and *Erzählungen*, 7 vols., 1824-37.

JACOTOT, Joseph (1770-1840), a French educationist, and author of the method of "Emancipation intellectuelle," was born at Dijon, March 4, 1770. He was educated at the university of Dijon, where in his nineteenth year he was chosen professor of Latin, after which he studied law, became advocate, and at the same time devoted a large amount of his attention to mathematics. In 1788 he organized a federation of the youth of Dijon for the defence of the principles of the Revolution; and in 1792, with the rank of captain, he set out to take part in the campaign of Belgium, where he conducted himself with bravery and distinction. After for some time filling the office of secretary of the "commission d'organisation du mouvement des armées," he in 1794 became deputy of the director of the Polytechnic school, and on the institution of the central schools at Dijon he was appointed to the chair of the "method of sciences," where he made his first experiments in that mode of tuition which he afterwards developed more fully. On the central schools being replaced by other educational institutions, Jacotot occupied successively the chairs of mathematics and of Roman law until the overthrow of the empire. In 1815 he was elected a representative to the chamber of deputies; but after the second restoration he found it necessary to quit his native land, and having taken up his residence at Brussels, he was in 1818 nominated by the Government teacher of the French language at the university of Louvain, where he perfected into a system the educational principles which he had already practised with success in France. His method was not only adopted in several institutions in Belgium, but also met with some approval in France, England, Germany, and Russia. An account of it will be found in the article Education, vol. vii. pp. 588-89. After the revolution of 1830 Jacotot returned to France, and he died at Paris, July 30, 1840.

His system was described by him in *Enseignement universel, Langue maternelle*, Louvain and Dijon, 1823—which has passed through several editions—and in various other works; and he also advocated his views in the *Journal de l'Emancipation intellectuelle*. For a complete list of his works and fuller details regarding his career, see *Biographie de J. Jacotot*, by Achille Guillard, Paris, 1860.

JACQUARD, Joseph Marie (1752-1834), inventor of the Jacquard silk-weaving loom, was born of humble parents at Lyons, July 7, 1752. The earlier part of his life is involved in considerable obscurity, though it is said that his mechanical talent was manifest from an early age. Jacquard married in 1777, and at the death of his father fell heir to two looms and a small sum of money. These, however, like Palissy's furniture, were sacrificed to the inventive pursuits of their owner, who was at last forced to become a lime-burner at Bresse, while his wife supported herself at Lyons by plaiting straw. In 1793 Jacquard took part in the unsuccessful defence of Lyons against the troops of the convention; but afterwards served in their ranks on the Rhone and Loire. After seeing some active service, in which his young son was shot down at his side, Jacquard again returned to Lyons, where he succeeded in finding work. He still labored at his machines, and in 1801 a medal was awarded him for an invention which he exhibited in the industrial exhibition at Paris, whereby one workman per loom was superseded in the weaving of figured silks. Jacquard was summoned to Paris, and after interviews with Napoleon and Carnot was attached to the Conservatoire des Arts et Métiers. A loom of Vaucanson's, deposited there, suggested various improvements in his own, which he gradually perfected to its final state. In 1804 he returned to Lyons, and although his invention was fiercely opposed by the silk weavers, whom it threatened to deprive of a livelihood, its advantages were too great to suffer resistance. Many years before his death, which occurred at Oullins, a village near Lyons, on August 7, 1834, the inventor had the satisfaction of seeing his loom in almost universal use, and, as a consequence, the prosperity of his native city rapidly advancing. Jacquard was rewarded with a pension of £60, a royalty of £2 upon each loom erected, and the cross of the legion of honor. His statue was erected in Lyons in 1840.

See Lamartine's *Jacquard*, and the article Weaving.

JADE, a name popularly applied to several distinct ornamental stones, but restricted scientifically to a definite mineral species known as *nephrite*. The term nephrite, from νεφρός, the kidney, refers to the reputed value of the mineral in renal diseases, whence it was formerly known as *Lapis nephriticus*. Probably the word *jade* is a corruption of the Spanish *hijada*, since this mineral is one of the stones which were known to the Spanish conquerors of Mexico and Peru under the name of *piedra de hijada*, or "stone of the loins"—a name which first appears in the writings of Monardes, in 1565, as *piedra de la yjada*. So numerous have been the names applied to this mineral in various parts of the world, and at different times, that Professor Fischer has collected nearly one hundred and fifty synonyms of jade.

True jade, or nephrite, is a native silicate of calcium and magnesium, which may be regarded as a compact or crypto-crystalline variety of hornblende, and may be referred either to actinolite or to tremolite, according as its color tends to green or to white. It never exhibits crystalline form or distinct cleavage; but, according to recent observers who have visited the old quarries in Turkestan, and have seen the mineral *in situ*, traces of cleavage may occasionally be observed; usually, however, the substance breaks with a splintery fracture. The specific gravity of jade varies from 2.91 to 3.06, and offers one of the readiest means of distinguishing between this mineral and others with which it is likely to be confounded. Most specimens of jade are scratched by flint or quartz, their hardness being about 6.5; but, while the hardness is not excessive, the mineral is remarkable for its toughness. It is notable that Hermann von Schlagintweit, who inspected the quarries in the Kara-kash valley, found that the hardness of the stone when freshly broken was considerably less than that assumed by it after a short exposure. The color of jade is subject to great diversity—some varieties presenting almost every shade of green, while others are yellowish, grey, or even white.

So far as is at present known, no true jade has ever been detected *in situ* in Europe. A loose block has been found at Schwemsal near Leipsic, and the mineral is said to occur in the drift at Potsdam near Berlin. Corsica and Turkey have also been recorded as jade localities, but probably on insufficient grounds.

It is by the Chinese that jade has always been most highly prized, and, notwithstanding its intractability, most elaborately carved. To the Chinese it is known under the name of *yu* or *yu-chi* (yu-stone). Much of the Chinese jade was formerly obtained from quarries in the Kuen-lun mountains, on the sides of the Kara-kash valley, in Turkestan. These ancient workings were visited and described a few years ago by H. v. Schlagintweit, by Dr. Stolicka, and by Dr. Cayley. The mineral is found in nests and veins running through schistose and gneissose rocks. It is probable that jade occurs throughout the Kuen-lun range, and that a rich site exists to the south of Khotan. The Khotan jade has been known to the Chinese for upwards of two thousand years. In Turkestan the jade is known as *yashm* or *yeshm*, a word which appears in

Arabic as *yeshb*, and is said to be cognate with ἴασπις or jasper. Indeed, by early mineralogists the jade was often described as *jaspis viridis.* Fine boulders of dark green jade have been found by M. Alibert in the neighborhood of his graphite mine near Batougol in Siberia. New Zealand is one of the most famous localities for jade, and the stone is highly prized by the natives, who work it, with great labor, into amulets, axe-heads, and various other objects. Among these objects may be mentioned the peculiar club-like implement known as the *mere* or *pattoo-pattoo*, and the hideous breast ornament termed *hei tiki.* By the Maories jade is known as *punamu* or "green-stone," and the occurrence of this mineral along the western coast of the south island has led to the name *Te wahi punamu* or "the place of the green-stone," being applied to this district. Jade also occurs in New Caledonia and in some of the smaller Pacific islands. In consequence of its use by the South Sea islanders as a material for making axe-heads, it is often known to German mineralogists as *Beilstein* or "axe-stone."

Under the name of "oceanic jade," M. Damour has described a fibrous variety found in New Caledonia and in the Marquesas Islands, having a specific gravity of 3.18, and differing from ordinary nephrite in the proportion of lime and magnesia which it contains. If this oceanic jade be recognized as a distinct variety, the ordinary nephrite may be distinguished as "oriental jade."

Although it was from America that the original jade, or "spleen-stone," was introduced into Europe, it is curious that few, if any, American localities for this mineral are recorded in modern works on mineralogy. Dr. Dawson has, however, noted its occurrence in British Columbia. At the time of the Spanish conquest of America, amulets in jade or in some jade-like mineral were highly venerated throughout Mexico, Central America, and Peru. It has been supposed by Mr. E. G. Squier that jade was one of the green stones so greatly prized by the ancient Mexicans under the name of *chalchihuitl.* The "Amazon stone," which has sometimes been regarded as jade, is a green variety of microcline-felspar; while the "Bowenite" from Smithfield in Rhode Island, which was at one time supposed to be nephrite, is found to be a variety of serpentine of unusual hardness. Serpentine is also used as a substitute for jade in some of the common objects imported from China.

While true jade has not hitherto been found *in situ* in Europe, it is a very suggestive fact that neolithic celts and scrapers have been found among the relics of several of the ancient pile-dwellings in the lakes of Switzerland. The principal localities have been the stations of Lüscherz and Schaffis on the Lake of Bienne (Biel), Meilen on the Lake of Zurich, and Robenhausen on the Lake of Pfäffikon. Yet no jade has been discovered among the rocks of the Swiss Alps; neither have any chippings been found which might lead us to suspect that the stone was worked in Switzerland. As it seems beyond doubt that the jade must be a foreign material, it becomes an interesting question to determine whether such objects were obtained by barter, or had been brought by the ancestors of the old lake-dwellers from their primitive abode in the East, and preserved generation after generation during their migration westwards. It should be mentioned that jade celts have been found by Dr. Schliemann among the relics of the oldest of the cities at Hissarlik. A jade celt engraved with a Gnostic formula in Greek characters is preserved in the Christy collection; and among the Assyrian and Babylonian seal-cylinders in the British museum there is said to be one specimen of jade.

It was shown by M. Damour, in 1863, that much of the so-called jade is altogether different from nephrite, and must be separated as a distinct species, for which he suggested the name of "jadeite." Jadeite is a silicate of aluminium and sodium, and therefore differs widely from nephrite in chemical composition. Mineralogically its relations lie rather with epidote than with hornblende. Its color is generally brighter than that of nephrite, and the paler-tinted kinds often contain veins of a bright-green color. It is slightly harder than nephrite, but its most distinctive characteristic is its high specific gravity; this ranges from 3.28 to 3.35, while the density of nephrite, even in oceanic jade, never exceeds 3.18.

Much of the Chinese "jade" is really jadeite. According to Pumpelly the jadeite of Yu-nan in southwest China is known as *fei-tsui.* Jadeite also occurs to the north-west of Bhamo in Burmah. Axes of jadeite are not unfrequently found in the remains of the Swiss lake-dwellings, but the mineral is not known to occur in the rocks of Europe. Jadeite forms the substance of many ancient Mexican ornaments, while implements wrought in the same material have been found in Costa Rica. Fischer records an Egyptian scarabæus in jadeite.

The green jade-like stones which are known to the Maories as *kawa-kawa* and *tangiwai* do not appear to be either jade or jadeite. From analyses published by Von Hochstetter, the former is a high graded silicate of aluminium and magnesium, while the latter is a silicate of aluminium, calcium, magnesium, and iron.

It was pointed out by Damour, in 1865, that certain stone celts found in the dolmens of France and in the lakes of Switzerland, as well as some from Mexico, are wrought in a material which resembles jadeite, but contains a larger proportion of iron, and is marked by having a specific gravity as high as 3.4 or even 3.65. This substance he distinguished as *chloromelanite*, a word which has an unfortunate resemblance to the name *chloromelan* which Breithaupt bestowed, as far back as 1823, upon a mineral resembling cronstedite. Damour's chloromelanite is a substance of spinach-green or blackish-green color, frequently flecked with paler patches, and enclosing garnets and iron-pyrites. When H. B. de Saussure examined the geology of the Swiss Alps, he found a greenish mineral, of singular toughness, which he described as jade. By Haüy it was afterwards called *jade tenace.* Its chemical composition, however, is quite unlike that of jade, and Beudant separated it as a distinct mineral under the name of "saussurite." Placed by the older mineralogists among the felspars, it seems to take its right position with the species called zoisite. Saussurite is a silicate of aluminium and calcium, having a specific gravity of about 3.2. It forms a constituent of the Alpine rock known as "euphotide," boulders of which are scattered around the Lake of Geneva, and were used by the lake-dwellers in the manufacture of implements.

Another mineral occasionally mistaken for some of the paler kinds of jade, and used as a material for implements by the Neolithic occupants of western Europe, is the species termed "fibrolite." This is a silicate of aluminium, with a specific gravity of about 3.2,—a density serving to distinguish it from quartz, while it may be separated from other jade-like minerals by its infusibility.

The following table, containing a few selected analyses of jade and the other minerals mentioned in this article, may be useful for reference.

The literature of jade is very extensive, but it will be sufficient to refer to the work of Heinrich Fischer, which is almost exhaustive of the subject: *Nephrit und Jadeit, nach ihren mineralogischen Eigenschaften sowie nach ihrer urgeschichtlichen und ethnographischen Bedeutung*, 2d ed., Stuttgart, 1880. (F. W. R.*)

JAEN, a province of Spain, in the north-east of Andalucia, is bounded on the N. by Ciudad Real, on the E. by Albacete and Granada, on the S. by Granada, and on the W. by Cordoba, and has an area of 5184 square miles. It may be described in general terms as consisting of the upper basin of the Guadalquivir, by which it is traversed from east to west. The main affluents of that river within the province are the Guadianamenor on the left and the Guadalimar on the right. Situated immediately between the Morena and Nevada chains, Jaen is largely overrun by lofty spurs from both those systems, the most prominent being the Loma de Chiclana and the Loma de Ubeda in connection with the former, and the Sierras de Cazorla, de Segura, and del Pozo, with the more isolated Sierra Magina and Monte Jabalcuz in connection with the latter. As in the other provinces presenting similar physical conditions, there are great inequalities of climate, that of the valleys being warm and admitting of olive and vine culture, while the bleak wind-swept uplands are only available as sheep-walks. The mineral wealth of Jaen, which has been known from the time of the Romans, is great, and the mining industry (Linares) is the most important in the province. Agriculture is in a very backward state, the grain produced being insufficient for local demands. The total population in 1877 was 422,972. There are twenty-four towns with a population exceeding 5000,—the most important being, besides Jaen the capital, Alcalá la Real, Andújar, Baeza, Bailen, Linares, Martos, Ubeda.

JAEN, the capital of the above province, is picturesquely situated 37 miles north of Granada and 120 miles east of Seville, on the Jaen (an affluent of the Guadalquivir), at the base and on the slopes of an acclivity surmounted by an ancient Moorish citadel, with which the walls of the city are connected. Its elevation above the sea-level is about 1800 feet. The streets, rising above one another on the hillside, are narrow and irregularly built; but there is a fine alameda commanding magnificent views of the surrounding country. The principal public building is the cathedral, built in the 16th century, in the Græco-Roman style, on the site of an old Moorish mosque destroyed in 1492. In it is preserved the relic called “El Santo Rostro” or “La Santa Faz,” “the Holy Face,” said to have been impressed by the Saviour on the handkerchief of St. Veronica. Besides the cathedral, there are twelve parish churches and fourteen religious houses; the city also possesses hospitals, barracks, a theatre, and “instituto,” a library, and a museum of painting and sculpture. The manufactures of Jaen are unimportant. The population in 1877 was 24,392.

The identification of Jaen with the Roman *Aurinx*, which has sometimes been suggested, is extremely questionable. During the period of Arab domination it early became a commercial centre of considerable importance, under the name of Jayyan, and ultimately rose to the dignity of capital of a petty kingdom, which was brought to an end only in 1246 by Ferdinand III., who transferred thither the bishopric of Baeza. Ferdinand IV., “El Emplazado,” died at Jaen in 1312. In 1712 the town suffered severely from an earthquake.

JAFFA. See JOPPA.

JAFFNA, or JAFFNAPATAM, a town of Ceylon, situated in a peninsula of the same name at the northern extremity of the island. It is a place of 34,684 inhabitants, according to the census of 1871; and, besides the usual administrative buildings of a district-town, it has a college (established in 1872) and a public library. The fort was described by Tennent as “the most perfect little military work in Ceylon—a pentagon built of blocks of white coral.” The European part of the town bears the Dutch stamp more distinctly than any other town in the island; and there still exists a Dutch Presbyterian church. Several of the church buildings date from the time of the Portuguese. The inhabitants, mainly Tamils, are remarkably industrious, and their careful system of cultivation has turned the naturally sandy peninsula into a scene of luxuriant beauty. In 1873 there were fifty-one European cocoa-nut estates in the district.

Jaffna, or, as the natives call it, Yalpannan, was occupied by the Tamils about 204 B. C., and there continued to be Tamil rajahs of Jaffna till 1617, when the Portuguese took possession of the place. As early as 1544 the missionaries under Francis Xavier had made converts in this part of Ceylon, and after the conquest the Portuguese maintained their proselytizing zeal. They had a Jesuit college and a Franciscan and a Dominican monastery. The Dutch drove out the Portuguese in 1658. The Church of England Missionary Society began its work in Jaffna in 1818, and the American Missionary Society in 1822.

JAGÁDHRI, a municipal town in Ambálá district, Punjab, India, is situated in 30° 10′ N. lat. and 77° 20′ 45″ E. long., a little west of the river Jumna, 37 miles south-east of Ambálá city, and 3 miles north of the Sind, Punjab, and Delhi Railway. Before the Síkh invasions, Jagádhri was a mere village; but Rái Sinh of Búria, the Síkh conqueror, encouraged the commercial and manufacturing classes to settle on the spot, so that a considerable trade rapidly sprang up. Destroyed by Nádir Sháh during one of his incursions, but rebuilt in 1783 by Rái Sinh, it passed to the British in 1829, together with the territory of which it was the capital. Jagádhri has imports of copper and iron, considerable manufacture of metal work, and exports of vessels and tools. It contains a *tahsíli*, police-office, and rest-house. The population in 1868 was 11,676, comprising 9220 Hindus, 2319 Mahometans, and 137 Síkhs.

JAGUAR (*Felis onca*). This powerful and ferocious animal is the largest of the species of *Felidæ* found upon the American continent. It ranges from

Jaguar.

Texas through Central and South America into Patagonia. In the countries which bound its northern limit it is not frequently met with, but in South America it is still quite common, and Azara states that when the Spaniards first settled the district between Montevideo and Santa Fé, as many as two thousand were killed yearly. The jaguar is usually found singly, or sometimes in pairs, and preys upon such quadrupeds as the horse, tapir, capybara, dogs, or cattle, and its strength is so great that it has been known to swim with a horse it had killed across a wide river, and then to carry its prey into the woods. It rarely slays at a time more than is requisite to satisfy its hunger, and leaves the unconsumed portions for the benefit of any stray prowler who may find them. Its manner of killing its victim is, after springing upon it, to strike it to the earth by a blow of its powerful paw. The jaguar often feeds upon turtles, sometimes following the reptiles into the water to effect a capture; having secured one and turned it over on its back, it inserts a paw between the shells and drags out the body of the turtle by means of its sharp claws. Occasionally, after having tasted human flesh, the jaguar becomes a confirmed man-eater. The cry of this great cat, which is heard at night, and most frequently during the pairing season, is deep and hoarse in tone, and consists of the sound *pu*, *pu*, often repeated. The female brings forth from two to four cubs towards the close of the year; they are able to follow their mother in about fifteen days after birth. The color of the jaguar varies greatly among individuals, ranging from white to black, the rosette markings in the extremes being but faintly visible. The general or typical coloration is a rich tan upon the head, neck, body, outside of legs, and tail near the root. The upper part of the head and sides of the face are thickly marked with small black spots, and the rest of the body is covered with rosettes, formed of black spots, with a black spot in the centre, and ranged lengthwise along the body in five to seven rows on each side. These black rings are heaviest along the back. The lips, throat, breast, and belly, the inside of the legs, and the lower sides of tail are pure white, marked with irregular spots of black, those on the breast being long bars, and on the belly and inside of legs large blotches. The tail has large black spots near the root, some with light centres, and from about midway of its length to the tip it is ringed with black. The ears are black behind, with a large buff spot near the tip. The nose and upper lip are light rufous brown. The size varies, the total length of a very large specimen measuring 6 feet 9 inches; the average length, however, is about 4 feet from the nose to root of tail. In form the jaguar is thick-set: it does not stand high upon its legs; and in comparison with the leopard it is heavily built. But its movements are very rapid, and it is fully as agile as its more graceful relative. The skull resembles that of the lion and tiger, but is much broader in proportion to its length. The forehead is concave, and the nasal region broad. The frontal processes of the maxillary are rounded, in contra-distinction to the truncated form of the tiger and the pointed one of the lion, and do not extend as far back as the fronto-nasal articulation. On the inner edge of the orbit is a well-developed tubercule. The canines are long and stout, the molar series well developed. The second sillon on the outer side of the crown of the canines is rudimentary, sometimes absent.

JAHÁNÁBÁD, a town in Gayá district, Bengal, situated on the Patná road, 25° 13′ 10″ N. lat., 85° 2′ 10″ E. long. Population (1872) 21,022—namely, 12,413 Hindus and 8609 Mahometans. It was at one period a flourishing trading town, and in 1760 it formed one of the eight branches of the company's central factory at Patná. Since the introduction of Manchester goods, the trade of the town in cotton cloth has almost entirely ceased; but large numbers of the Juláha or weaver caste live in the neighborhood.

JAHN, Johann (1750–1816), a distinguished Orientalist and Biblical critic of the Roman Catholic Church, was born at Tasswitz, Moravia, on June 18, 1750. After completing his school education at Znaim he studied philosophy at Olmütz, and in 1772 began his theological studies at the Præmonstratensian convent of Bruck in the neighborhood of Znaim. Having been ordained to the priesthood in 1775, he for a short time held a cure of souls at Mislitz, but was soon recalled to Bruck to become professor of Oriental languages and Biblical hermeneutics there. On the suppression of the convent by Joseph II. in 1784, Jahn was removed to a chair at Olmütz corresponding to that which he had previously held, and in 1789 he was transferred to Vienna as professor of Oriental languages, Biblical archæology, and dogmatics. In 1792 he published his *Einleitung ins Alte Testament* (2 vols.), which almost immediately began to cause him trouble; a certain Cardinal Migazzi laid a complaint against him before the emperor because in his preface he had confessed himself to have in some points departed from the views of his learned predecessors and adopted opinions of his own, while in the work itself he declared Job, Jonah, Tobit, and Judith to be didactic poems. To these charges was added a third, that in his New Testament lectures he had stated the cases of demoniacal possession there mentioned to be cases of natural disease. On the matter being referred to an ecclesiastical commission, it was reported that the views themselves were not necessarily heretical, but that Jahn had shown undue rashness in giving out, as his own, opinions which teachers of theology ought not to mention otherwise than as foreign; in accordance with this it was decided that he ought to modify his expressions in future editions of his work and in his subsequent lecturing. Although he appears honestly to have accepted this judgment, the hostility of those who were opposed to his teaching did not cease until at last (1806) he was compelled to accept a canonry at Vienna, which involved the resignation of his chair. This step had been preceded by the condemnation of his *Introductio in libros sacros Veteris Fœderis in compendium redacta*, published in 1804, and also of his *Archœologia Biblica in compendium redacta* (1805). The only work of importance, outside the region of mere philology, afterwards published by him, was the *Enchiridion Hermeneuticœ* (1812). He died August 16, 1816. Jahn's place in the history of the modern science of Biblical criticism is undoubtedly an honorable one, and also of some importance, especially when his ecclesiastical environment is taken into account. If he cannot be said to have been either very original or very profound, he has at least the merit of being laborious, candid, and clear-sighted within his range of vision; one of his books, the *Archœologia*, is not even yet entirely superseded.

Besides the works already mentioned, he published *Hebräische Sprachlehre für Anfänger*, 1792; *Aramäische od. Chaldäische u. Syrische Sprachlehre für Anfänger*, 1793; *Arabische Sprachlehre*, 1796; *Elementarbuch der Hebr. Sprache*, 1799; *Chaldäische Chrestomathie*, 1800; *Arabische Chrestomathie*, 1802; *Lexicon Arabico-Latinum Chrestomathiæ accommodatum*, 1802; an edition of the Hebrew Bible, 1806; *Grammatica linguæ Hebraicæ*, 1809; a critical commentary on the Messianic passages of the Old Testament (*Vaticinia prophetarum de Jesu Messia*), 1815. In 1821 a collection of *Nachträge* appeared, containing six dissertations on Biblical subjects. The English translation of the *Archæologia* by Upham has passed through several editions. See A. G. Hoffman's article in Ersch and Gruber's *Encyclopädie*.

JAHN, Otto (1813–1869), eminent alike as an archæologist, philologist, and art critic, was born June 16, 1813, at Kiel, where he began under Nitzsch the philological and archæological education which he continued at Leipsic under Hermann and at Berlin under Lachmann and Gerhard. After the completion of his university studies he travelled for three years (1836–39) in France and Italy; having "habilitated" in 1839 at

Kiel, he in 1842 became professor-extraordinary of archæology and philology at Greifswald, where in 1845 he was promoted to the rank of ordinarius. In 1847 he accepted the chair of archæology at Leipsic, but for having taken part in the political movements of 1848–49 he was deprived in 1851. He continued to remain in private life until in 1855 he was appointed ordinary professor of the science of antiquity, and director of the academical art museum at Bonn. In 1867 he was called to succeed Gerhard at Berlin; but after a lingering illness he died at Göttingen, September 9, 1869.

The following list of his works is not to be regarded as exhaustive. 1. Archæological: *Telephos u. Troilos*, 1841; *die Gemälde der Polygnot*, 1841; *Specimen epigraphicum in memoriam Kellermanni*, 1842; *Pentheus u. die Mänaden*, 1842; *Paris u. Oinone*, 1845; *Die hellenische Kunst*, 1846; *Peitho, die Göttin, der Ueberredung*, 1847; *Ueber einige Darstellungen des Paris-Urtheils*, 1849; *Die Ficoronische Cista*, 1852; *Beschreibung der Vasensammlung des Königs Ludwig*, 1854; *Die Wandgemälde des Columbariums in der Villa Pamfili*, 1857; *Pausaniæ descriptio arcis Atheniensis*, 1860; *Darstellungen griechischer Dichter auf Vasenbildern*, 1861; *Ueber bemalte Vasen mit Goldschmuck*, 1865; *Ueber Darstellungen des Handwerks u. des Handelsverkehrs*, 1868. 2. Philological: Critical editions of Persius, 1843; Censorinus, 1845; Florus, 1852; the *Brutus*, 1849; and *Orator*, 1851; of Cicero; Juvenal, 1851; the *Periochæ* of Livy, 1853; the *Psyche et Cupido* of Apuleius; the *Electra* of Sophocles, 1861; Longinus, 1867. 3. Biographical and Æsthetic: *Ueber Mendelssohn's Paulus*, 1842; *Biographie Mozart's*, a work of extraordinary labor and loving care, 1856–1860; *Ludwig Uhland*, 1853; *Gesammelte Aufsätze über Musik*, 1866; *Biographische Aufsätze*, 1866.

JAINS, the most numerous and influential sect of heretics, or nonconformists to the Brahmanical system of Hinduism, in India, are found in every province of Upper Hindustan, in the cities along the Ganges, and in Calcutta. But they are more numerous to the west—in Mewar, Guzerat, and in the upper part of the Malabar coast—and are also scattered throughout the whole of the southern peninsula. They are mostly traders, and live in the towns; and the wealth of many of their community gives them a social importance greater than would result from their mere numbers. Of what their actual number may be it is unfortunately impossible to form any exact estimate, as in the census returns they are confounded with the Buddhists. Their magnificent series of temples and shrines on Mount Abu, one of the seven wonders of India, is perhaps the most striking outward sign of their wealth and importance.

The Jains are the last direct representatives on the continent of India of those schools of thought which grew out of the active philosophical speculation and earnest spirit of religious inquiry so rife in the valley of the Ganges during the 5th and 6th centuries before the Christian era. For many centuries Jainism was so overshadowed by that stupendous movement, born at the same time and in the same place, which we call Buddhism, that it remained almost unnoticed by the side of its powerful rival. But when Buddhism, whose widely open doors had absorbed the mass of the community, became thereby corrupted from its pristine purity and gradually died away, the smaller school of the Jains, less diametrically opposed to the victorious orthodox creed of the Brahmans, survived, and in some degree took its place.

Jainism purports to be the system of belief promulgated by Vardhamāna, better known by his epithet of Mahā-vīra, who was a contemporary of Gautama, the Buddha. But the Jains, like the Buddhists, believe that the same system had previously been proclaimed through countless ages by each one of a succession of earlier teachers. The Jains count twenty-four such prophets, whom they call Jinas, or Tīrthankaras, that is, conquerors or leaders of schools of thought. It is from this word Jina, that the modern name Jainas, meaning followers of the Jina, or of the Jinas, is derived. This legend of the twenty-four Jinas contains a germ of truth. Mahā-vīra was not an originator; he merely carried on, with but slight changes, a system which existed before his time, and which probably owes its most distinguishing features to a teacher named Pārṣwa, who ranks in the succession of Jinas as the predecessor of Mahā-vīra. Pārṣwa is said, in the Jain chronology, to have lived two hundred years before Mahā-vīra (that is, about 700 B. C.); but the only conclusion that it is safe to draw from this statement is that Pārṣwa was considerably earlier in point of time that Mahā-vīra. Very little reliance can be placed upon the details reported in the Jain books concerning the previous Jinas in the list of the twenty-four Tīrthankaras. The curious will find in them many reminiscences of Hindu and Buddhist legend; and the antiquarian must notice the distinctive symbols assigned to each, in order to recognize the statues of the different Jinas, otherwise identical, in the different Jain temples.

Very little is at present known of the details of the Jain system of belief. But fresh light is being thrown upon this question year by year, and some of their principal tenets are already beyond dispute. The Jains are divided into two great parties,—the *Digambaras*, or Sky-clad Ones, and the *Swetāmbaras*, or the White-robed ones. The latter have only as yet been traced, and that doubtfully, as far back as the 6th century after Christ; the former are almost certainly the same as the Niganṭhas, who are referred to in numerous passages of the Buddhist Pāli Piṭakas, and must therefore be at least as old as the 4th century B. C. In many of these passages the Niganṭhas are mentioned as contemporaneous with the Buddha; and details enough are given concerning their leader Niganṭha Nāta-putta (that is, the Niganṭha of the Jnātrika clan) to enable us to identify him, without any doubt, as the same person as the Vardhamāna Mathā-vīra of the Jain books. This remarkable confirmation, from the scriptures of a rival religion, of the Jain tradition seems conclusive as to the date of Mathā-vīra; and, should any one still doubt the antiquity of the sect, it may be mentioned here that the Niganṭhas are referred to in one of Asoka's edicts (*Corpus Inscriptionum*, Plate xx.). Unfortunately the account of the teachings of Niganṭha Nāta-putta given in the Buddhist scriptures are, like those of the Buddha's teachings given in the Brahmanical literature, not only very meagre, but also very little to be depended upon. And the Jain scriptures themselves, though based on earlier traditions, are not older in their present form than the 6th century of our era. The most distinctively sacred books are called the forty-five Āgamas, consisting of eleven Angas, twelve Upangas, ten Pakiṇṇakas, six Chedas, four Mūla-sūtras, and two other books. Several of these are in process of translation into English for the series of translations from the sacred books of the East now being published under the auspices of the university of Oxford. It was Devaddhigaṇin, who occupies among the Jains a position very similar to that occupied among the Buddhists by Buddhoghosa, who at the date just mentioned collected the then existing traditions and teachings of the sect into these forty-five Āgamas. It is most probable that, previous to his time, the sacred lore of the Jains was handed down by memory, and not by writing. This mode of transmitting a literature seems very unsafe according to modern European ideas. But when we call to mind the very great value of the historical results drawn from the Vedas and the Buddhist scriptures, both of which were for many centuries preserved for posterity by memory alone, we may confidently look forward to important additions to our knowledge when the Jain Āgamas shall have been made accessible to European scholars. Like the Buddhist scriptures, the earlier Jain books are written in a dialect of their own, the so-called Jaina Prākrit; and it was not till between 1000 and 1100 A.D. that the Jains adopted Sanskrit as their literary language.

The most distinguishing outward peculiarity of Mahā-vīra and of his earliest followers was their practice of going quite naked, whence the term *Digambara.* Against this custom Gautama, the Buddha, especially warned his followers; and it is referred to in the well-known Greek phrase *Gymnosophist,* used already by Megasthenes, which applies very aptly to the Niganṭhas. Even the earliest name Niganṭha, which means "free from bonds," may not be without allusions to this curious belief in the sanctity of nakedness, though it also alluded to freedom from the bonds of sin and of transmigration. The statues of the Jinas in the Jain temples, some of which are of enormous size, are still always quite naked; but the Jains themselves have abandoned the practice, the Digambaras being sky-clad at meal time only, and the Swetāmbaras being always completely clothed. And even among the Digambaras it is only the recluses or *Yatis,* men devoted to a religious life, who carry out this practice. The Jain laity—the *Srāvakas,* or disciples—do not adopt it.

The supreme aim of the Jains as of the Buddhists is called *Nīrvāṇa;* but the word conveys different ideas in the two religions. The Jains appear to believe in the existence of a soul inside the human body, and in the transmigration of souls; and their Nīrvāṇa seems to consist in the delivery of the soul from this transmigration. It differs from the *moksha* of the Hindus in that the Jains, not teaching the existence of a supreme being, do not hope for an absorption of the soul into the deity. This Nīrvāṇa will follow on the belief in certain metaphysical theories, the nature of which still remains unknown to scholars. But it is to be accompanied by the practice of the four virtues —liberality, gentleness, piety, and remorse for failings—by goodness in thought, word, and deed, and by kindness to the mute creation and even to the forms of vegetable life. This last item in their belief, though common to the Jains and the Buddhists, has been carried out by the Jains to a more extreme result, and seems to be based on the wide extension of the doctrine of the soul. They regard all animals and plants as endowed with souls, and they consider it an act of piety to put up and to maintain hospitals for sick animals. They believe also in the existence of numerous angels or demons, good and bad, among whom they include most of the deities of the Hindu pantheon; and the later Jains do not scruple to render a kind of worship to these spirits. This practice is, however, not in accordance with the earlier and stricter Jainism; and it is the negative side of their creed, their denial of the power of the gods, of the authority of the Vedas, and of the sacredness of caste, which has been the most important part of their teaching. Practically, no doubt, many of their laity adhere to some of the social caste distinctions of the Hindus; and their authors quote the Vedas with respect when passages from the Vedas can be used in support of their own views; but no distinction of caste excludes from their religious orders, or prevents the attainment of their Nīrvāṇa; and the Vedas, even when quoted, are not regarded as conclusively authoritative. Professor Jacobi, who is the best authority on the history of this sect, thus sums up the distinction between the Mahā-vīra and the Buddha: "Mahā-vīra was rather of the ordinary class of religious men in India. He may be allowed a talent for religious matters, but he possessed not the genius which Buddha undoubtedly had. . . . . The Buddha's philosophy forms a system based on a few fundamental ideas, whilst that of Mahā-vīra scarcely forms a system, but is merely a sum of opinions (*pannattis*) on various subjects, no fundamental ideas being there to uphold the mass of metaphysical matter. Besides this . . . . it is the ethical element that gives to the Buddhist writings their superiority over those of the Jains. Mahā-vīra treated ethics as corollary and subordinate to his metaphysics, with which he was chiefly concerned."

Authorities.—Bhadrabāhn's *Kalpa Sūtra* the recognized and popular manual of the Swetāmbara Jains, edited with English introduction by Professor Jacobi, Leipsic, 1879; Hemacandra's "Yoga Sāstram," edited by Windisch, in the *Zeitschrift der deutschen morg. Ges.* for 1874; "Zwei Jaina Stotra," edited in the *Indische Studien,* vol. xv.; *Ein Fragment der Bhagavatī,* by Professor Weber; *Mémoires de l'Académie de Berlin,* 1866; *Nirayāvaliya Sutta,* edited by Dr. Warren, with Dutch introduction, Amsterdam, 1879; *Over de godsdienstige en wijsgeerige Begrippen der Jainas,* by Dr. Warren (his doctor-dissertation, Zwolle, 1875); *Beiträge zur Grammatik des Jaina-prākrit,* by Dr. Edward Müller, Berlin, 1876; Colebrooke's *Essays,* vol. ii. Mr. Burgess has an exhaustive account of the Jain Cave Temples (none older than the 7th century) in Fergusson and Burgess's *Cave Temples in India,* London, 1880. (T. W. R. D.)

JÁINTIA HILLS. For administrative purposes the Jáintia Hills are regarded as a subdivision of the Khási and Jáintia Hills district, in the province of Assam. They cover an area of about 2000 square miles, and are bounded N. by the district of Nowgong, E. by Cachar, S. by Sylhet, and W. by the Khási Hills.

The Jáintia Hills are divided into twenty-five fiscal divisions, of which three are inhabited by Kukí or Lushái immigrants, and one by Mikirs. The remainder of the inhabitants are Syntengs, a race akin to the Khásis, but with distinct ethnical characteristics and language. The chief crop is rice, grown on the nomadic system of agriculture known as *júm.* The most valuable natural product is limestone, which is quarried on the river banks, and despatched by water into Bengal from the Sylhet markets. Coal of excellent quality has been found in situations mostly inaccessible to water traffic. The Syntengs are keen traders, and retain in their own hands the valuable commerce of their hills. They frequent the markets held in the chain of villages at the foot of the hills on the Sylhet side. In 1876–77 the total value of exports from the sub-division was £19,000, and of the imports (chiefly cotton, woollen, and silk cloth, rice, dried fish, salt, and tobacco) £34,560. The gross revenue in the same year was £1271.

This tract was annexed in 1835, its rájá having been deposed for complicity in carrying away British subjects, and in their immolation as human sacrifices in a shrine of the goddess Kálí. At first no change was made in the indigenous revenue system, which consisted simply in the payment of a he-goat once a year by each village. In 1860, when a fresh taxation was introduced, the hillmen objected; and in January, 1862, they rose in open rebellion. The police station at Jowai was burned to the ground, the garrison of sepoys was closely besieged, and all show of British authority was swept away throughout the hills. The hillmen fought bravely for their independence. At first they were successful in cutting off several detachments of sepoys and police, but the ringleaders were captured, and order finally restored in March, 1863.

JÁIPUR. See JEYPORE.

JÁISALMIR, a native state in Rájputána, under the political superintendence of that agency and the Government of India, lying between 26° 5′ and 28° 24′ N. lat. and between 69° 30′ and 72° 50′ E. long., with an area of 16,447 square miles, is bounded on the N. by Baháwalpur, on the E. by Bíkaner and Jodhpur, on the S. by Jodhpur and Sind, and on the W. by Khairpur state and Sind.

Jáisalmir is almost entirely a sandy waste, forming a part of "the Great Indian Desert." The general aspect of the country is that of an interminable sea of sandhills, of all shapes and sizes, some rising to a height of 150 feet. Those in the west are covered with *phog* bushes, those in the east with tufts of long grass. Water is scarce, and generally brackish; the average depth of the wells is said to be about 250 feet. There are no perennial streams, and only one small river, the Kakni, which, after flowing a distance of 28 miles, spreads over a large surface of flat ground, and forms a lake or *jhíl* called the Bhuj-Jhíl. The climate is essentially dry and healthy. The temperature is highest in May and June; the coldest months are from the middle of December to the middle of February. Throughout Jáisalmir, only rain-crops, such as *bájra, joár, moth, tíl,* etc., are grown; spring crops of wheat, barley, etc., are very rare, Owing to the scanty rainfall, irrigation is almost unknown.

The main part of the population lead a wandering life, grazing their flocks and herds. Large herds of camels, horned cattle, sheep, and goats are kept. The principal trade is in wool, *ghí,* camels, cattle, and sheep. The chief imports are grain, sugar, foreign cloth, piece-goods, etc. There is only one civil court. Education is at a very low ebb. Jain priests are the chief schoolmasters, and their teaching is very elementary. The income of the state for 1873-74 was £11,854, the expenditure £15,911. The maháráwal has a force of 651 infantry and 155 cavalry, who have no drill or discipline, but are very efficient as police. It has been estimated that the total number of inhabitants does not exceed 72,000; 43,500 are said to be Hindus, 26,000 Mahometans, and 2500 Jains.

The majority of the inhabitants are Yadu Bhati Rájputs, who take their name from an ancestor named Bhati, renowned as a warrior, when the tribe were located in the Punjab. Shortly after this the clan was driven southwards, and found a refuge in the Indian desert, which was thenceforth their home. Deoráj, a famous prince of the Bhati family, is esteemed the real founder of the present Jáisalmir dynasty, and with him the title of *ráwal* commenced. In 1156 Jáisal, the sixth in succession from Deoráj, founded the fort and city of Jáisalmir, and made it his capital. Jáisal was succeeded by several warlike princes, who were constantly engaged in battles and raids. In 1294 the Bhatis so enraged the emperor Alā-ud-dín that his army captured and sacked the fort and city of Jáisalmir, so that for some time it was quite deserted. After this there is nothing to record till the time of Ráwal Sabal Sinh, whose reign marks an epoch in Bhati history in that he acknowledged the supremacy of the Delhi emperor Sháh Jahán, and was the first of the Jáisalmir princes who held his dominions as a fief of the Delhi empire. The Jáisalmir princes had now arrived at the height of their power, but from this time till the accession of Ráwal Mulráj in 1762 the fortunes of the state rapidly declined, and most of its outlying provinces were lost. In 1818 Mulráj entered into political relations with the British. Since his death in 1820, no stirring events have occurred. The present chief is Mahárawal Bairi Sál, who was born in 1848, and is a Yadu Bhati Rájput. The ruler of Jáisalmir is styled *mahárawal*, and holds that position as head of the clan of Bhatis. The constitution may be described as tribal suzerainty in process of conversion to the feudal stage. Many of the tribal chiefs are to a great extent independent, insomuch that they hold their estates rent free.

JÁJPUR, or Jajpore, a municipal town in Cuttack district, Bengal, is situated on the right bank of the Baitaráni river, in 20° 50′ 45″ N. lat., 86° 22′ 56″ E. long. It contains the usual subdivisional and public buildings, a charitable dispensary, a Government-aided school, etc. It was the capital of the province of Orissa under the Kesarí dynasty until the 11th century, when it was superseded by Cuttack, the modern metropolis. Jájpur is celebrated as a settlement of Bráhman Sivaite priests, and as the headquarters of one of the four regions of pilgrimage into which Orissa is divided, viz., that sacred to Parvatí, the wife of the All-Destroyer. In Jájpur are numerous ruins of Sivaite temples, sculptures, etc. In the 16th century this town was the scene of the struggle between Musalmán and Hindu powers, from which it emerged in ruins. It, however, still ranks as the fourth town of Orissa, and derives much wealth from its yearly fair in honor of Baruní, "Queen of the Waters," at which numbers of pilgrims assemble to bathe in the holy Baitaráni, the Styx of Hindu mythology. The population in 1872 numbered 10,753.

JAKOB, Ludwig Heinrich von (1759–1827), a German writer on political economy, was born at Wettin, 26th February, 1759. After receiving preparatory instruction at Merseburg and at the gymnasium of Halle, he in 1777 entered the university of the latter city, at first devoting his attention specially to philological studies. In 1780 he was appointed teacher at the gymnasium, and, now occupying his leisure chiefly with the study of philosophy, he in 1785 obtained the degree of doctor of philosophy, and in 1791 was appointed professor of philosophy at the university. The suppression of the university of Halle having been decreed by Napoleon, Jakob betook himself to Russia, where in 1807 he was appointed professor of political economy at Kharkoff, and in 1809 a member of the Government commission to inquire into the finances of the empire. In the following year he became president of the commission for the revision of criminal law, and he at the same time obtained an important office in the finance department, with the rank of counsellor of state; but in 1816 he returned to Halle to occupy the chair of political economy. He died at Lauchstädt, July 22, 1827.

Shortly after his first appointment to a professorship in Halle, Jakob had begun to turn his attention rather to the practical than the speculative side of philosophy, and in 1805 he published at Halle *Lehrbuch der Nationalökonomie*, in which he was the first to advocate in Germany the necessity of a distinct science dealing specially with the subject of national wealth. His principal other works are *Grundriss der allgemeinen Logik*, Halle, 1788; *Grundsätze der Polizeigesetzgebung und Polizeianstalten*, Leipsic, 1809; *Einleitung in das Studium der Staatswissenschaften*, Halle, 1819; *Entwurf eines Criminalgesetzbuchs für das Russische Reich*, Halle, 1818; and *Staatsfinanzwissenschaft*, 2 vcls., Halle, 1821.

JALALABAD. See Afghanistan.

JALANDHAR, or Jullundur, a British district in the lieutenant-governorship of the Punjab, India, lies between 30° 56′ 30″ and 31° 37′ N. lat., and between 75° 6′ 30″ and 77° 49′ 15″ E. long., forming the southernmost district in the division[1] of the same name. It is bounded on the N.E. by the district of Hushiárpur, on the N.W. by the native state of Kapurthála and the river Biás, and on the S. by the Sutlej. The blunt triangular tongue of land enclosed by the confluent streams of the Sutlej and the Biás bears the general name of the Jalandhar Doáb. Its submontane portion belongs to Hushiárpur; the remainder is divided between Kapurthála state and the district of Jalandhar. Below the hills, the whole Doáb consists of one unbroken alluvial expanse, whose fertility extends from river to river. A well-defined bank marks the bed of the Sutlej on the Jalandhar side. In winter the river contains about 15 feet of water in its deepest parts, and is navigable at all seasons for large flat-bottomed country boats. The main channel shifts from year to year through the wide bed, often forming new islands by slight changes in its course. The Biás touches upon the district for a few miles only. The torrents from the Siwálik hills in Hushiárpur district unite in two main streams, the White and the Black Ben, the former of which runs through the whole of Jalandhar. The White Ben receives numerous affluents, which meet it at right angles; and, following a serpentine path in a deep channel, it finally falls into the Sutlej 4 miles above its junction with the Biás. Several marshy lakes (*jhíls*) collect a considerable quantity of water in the rains, which they retain throughout the dry season.

The chief staples are wheat, barley, gram, rice, sugar-cane, Indian corn, *joár*, cotton, and moth. Except on the low alluvial tract of the Sutlej, irrigation is carried on by means of wells, worked with Persian wheels. Water lies everywhere near the surface, and is absolutely necessary for the higher cereals and sugar-cane, so that well irrigation prevails very generally. The traffic of the district consists mainly in its agricultural produce. Sugar-cane forms the chief commercial crop, and sugar and molasses are largely manufactured. English piece-goods and draught cattle are the principal imports. Cotton cloth, silver wire, and gold and silver lace are manufactured at Jalandhar town. The Sind, Punjab, and Delhi Railway passes through the district, with stations at several of the principal towns. Education was carried on in 1875–76 by means of 1615 aided schools, with a total roll of 7876 pupils. The proximity of the hills renders the climate of Jalandhar comparatively moist, and the annual rainfall for the seven years ending 1872–73 amounted to 28.6 inches. Malarious fever in an endemic form proves the chief cause of mortality, but small-pox often appears as an epidemic, and dysenteric complaints are frequent. There are five Government charitable dispensaries, which afforded relief in 1872 to 34,308 persons.

Jalandhar ranks first in the density of its population amongst all the Punjab districts, and is only exceeded by those of Benares, Jaunpur, and Gházípur in the North-Western Provinces. The enumeration of 1868, taken over an area of 1332 square miles, disclosed a total population of 794,764 persons, of whom 436,689 were males and 358,075 females. As regards religion, Hindus numbered 318,401; Mahometans, 358,427; Síkhs, 117,167; and others, 769. The district contained eleven municipal towns in 1875–76, whose names and populations were as follows:—Jalandhar, 48,933; Kartárpur, 10,953; Aláwalpur, 4873; Adampur,

---

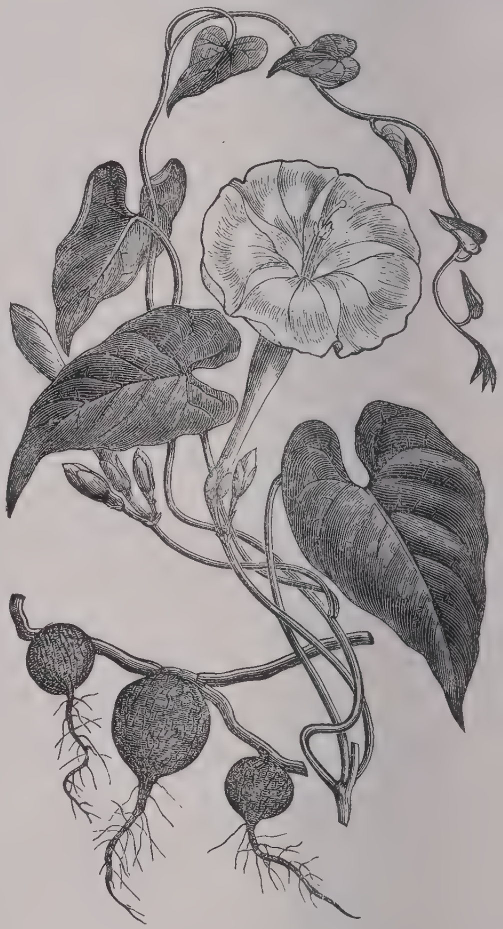
[1] Jalandhar, a division under a commissioner in the Punjab, comprises the three districts of Jalandhar, Hoshiárpur, and Kangra, between 30° 56′ 30″ and 32° 59′ N. lat., and 75° 6′ 30″ and 77° 49′ 15″ E. long., with an area of 12,181 square miles, of which 2738 are cultivated, and a population (1868) of 2,477,536, of whom 1,334,653 are males and 1,142,883 females.

3269; Banga, 4508; Nawashahr, 4946; Rahon, 14,394; Phillaur, 7535; Núrmahál, 7866; Mahatpur, 6374; and Nakodar, 8800. The following towns had populations exceeding 5000 in 1868:—Basti Shaikh, 8000; Bílga, 6441; Jandiála, 6439; Malsián, 6286; and Rurkha Kalan, 5721. The district contains a total cultivated area of 657,094 acres, of which 200,097 are artificially irrigated.

The Jalandhar Doáb in early times formed a separate Hindu kingdom, ruled by a family of Rájputs, whose descendants still exist in the petty princes of the Kángra hills. Under Mahometan rule the Doáb was generally attached to the province of Lahore, in which it is included as a *sarkár* or governorship in the great revenue survey of Akbar's reign. Its governors seem to have held a partially independent position, subject to the payment of a fixed tribute into the imperial treasury. The Síkh reaction extended to Jalandhar at an early period, and a number of petty chieftains established themselves by force as independent princes throughout the Doáb. In 1766 the town of Jalandhar fell into the hands of the Síkh confederacy of Faïz-ullá-puria, then presided over by Khushal Sinh. His son and successor built a masonry fort in the city, while several other leaders similarly fortified themselves in the suburbs. Meanwhile, Ranjít Sinh was consolidating his power in the south, and in 1811 he annexed the Faiz-ullá-puria dominions in the Doáb. By the autumn of the same year the mahárájá's authority was successfully established. Thenceforth Jalandhar became the capital of the Lahore possessions in the surrounding Doáb up to the date of the British annexation, which took place at the close of the first Síkh war.

JALANDHAR, a municipal town and cantonment in the above district, is situated in 31° 19′ 50″ N. lat. and 75° 37′ 20″ E. long. It lays claim to considerable antiquity, having been the original capital of the Rájput kingdom of Kátoch, which dates back to the period before Alexander's invasion. Hwen Tsang, the Chinese Buddhist pilgrim of the 7th century, describes the town as 2 miles in circuit, the metropolis of a considerable state. Ibráhim Sháh of Ghazní reduced the town to the Mahometan yoke, and it appears as a place of considerable strength during the early Musalmán times. The modern city consists of a cluster of wards, originally distinct, and each enclosed by a wall of its own. Some of them still remain detached, but the majority have now united. The cantonment is 4 miles from the town, and was established in 1846. It has an area of 7¼ square miles, and a population (1868) of 11,634 persons. Numerous suburbs, known as *bastis*, surround the city. The trade, though considerable, presents little special interest. The staples of local traffic are English piece-goods and country produce. In 1871–72 the imports were valued at £105,248, and the exports at £96,020. The population in 1868 was 50,067, of whom 15,921 were Hindus, 33,601 Mahometans, 468 Síkhs, and 77 Christians.

JALAP, a cathartic drug consisting of the tuberous roots of *Exogonium Purga*, Benth., a convolvulaceous plant growing on the eastern declivities of the Mexican Andes at an elevation of 5000 to 8000 feet above the level of the sea, more especially about the neighborhood of Chiconquiaco, and near San Salvador on the eastern slope of the Cofre de Perote. In these localities, where the temperature varies during the day from 60° to 75° Fahr. (15° to 24° C.), and rain falls almost every day, it flourishes in the deep rich soil of shady woods. Jalap has been known in Europe since the beginning of the 17th century, and derives its name from the city of Jalapa in Mexico, near which it grows, but its botanical source was not accurately determined until the year 1829, when Dr. Coxe of Philadelphia published a description and colored figure taken from living plants, sent him two years previously from Mexico. The Jalap plant has slender herbaceous twining stems, with alternately-placed cordate acuminate leaves sharply pointed at the basal angles, and salver-shaped deep purplish-pink flowers. The underground stems are slender and creeping; their vertical roots enlarge and form turnip-shaped tubers, which, as they do not bear leaf organs on their surface, are sometimes called tubercules. The roots are dug up in Mexico throughout the year, and are suspended to dry in a net over the hearth of the Indians' huts, and hence acquire a smoky odor. The large tubers are often gashed to cause them to dry more quickly. In appearance they vary from spindle-shaped to ovoid or globular, and in size from a pigeon's egg to a man's fist. Externally they are brown, and marked with small transverse paler scars, and internally they present a dirty white resinous or starchy fracture. The ordinary drug is distinguished in commerce as Vera Cruz jalap, from the name of the port whence it is shipped. The average annual imports into Great Britain have been estimated at 180,000 ℔.



Jalap (*Exogonium Purga*).

Jalap has been cultivated for ten years past in India, at Ootacamund, and grows there as easily as a yam, often producing clusters of tubers weighing over 9 ℔; but these, as they differ in appearance from the commercial article, have not as yet obtained a place in the English market. They are found, however, to be rich in resin, containing 18 per cent. In Jamaica also the plant has been grown, at first amongst the cinchona trees but more recently in new ground, as it was found to exhaust the soil. The 1880 crop of jalap in Jamaica amounted to 14,294 ℔, and sold in the fresh state for £62 3s. 8d. Some of it was exported to the London market.

Jalap owes its properties to *jalapin*, a resin which is present in it to the extent of 12 to 18 per cent. According to Mayer[1] its composition is $C_{31}H_{50}O_{16}$. Jalapin is soluble in alcohol, but insoluble in ether and bisulphide of carbon. Jalap also contains in small quantity *convolvulin*, a resin soluble in ether, homologous with jalapin, and of the composition $C_{34}H_{56}O_{16}$. It yields also about 19 per cent. of sugar according to Guibourt, and starch, gum, uncrystallizable sugar, and coloring matter.

---

[1] By Mayer, Gmelin, and others, jalapin is called convolvulin. It is identical with the rhodeoretin of Kayser.

Besides Mexican or Vera Cruz jalap, a drug called Tampico jalap has been imported during the last few years in considerable quantity. It has a much more shrivelled appearance and paler color than ordinary jalap, and lacks the small transverse scars present in the true drug. It differs also in containing in the place of jalapin a resin identical with the convolvulin above mentioned, and with the para-rhodeoretin of Kayser, which exists in it to the extent of 11 per cent. This kind of jalap, the Purga de Sierra Gorda of the Mexicans, was traced by Hanbury to *Ipomœa simulans*, Hanbury. It grows in Mexico along the mountain range of the Sierra Gorda in the neighborhood of San Luis de la Paz, from which district it is carried down to Tampico, whence it is exported. A third variety of jalap, known as woody jalap, male jalap, or Orizaba root, or by the Mexicans as Purgo macho, is derived from *Ipomœa orizabensis*, Ledanois, a plant of Orizaba. The root occurs in fibrous pieces, which are usually rectangular blocks of irregular shape, 2 inches or more in diameter, and are evidently portions of a large root. It is only occasionally met with in commerce. The resin contained in it is identical with that found in Tampico jalap.

According to Dr. W. Rutherford, jalap acts as a powerful hepatic and intestinal stimulant. It is used as a hydragogue cathartic in combination with cream of tartar in dropsy, and in all cases where it is desirable to cause a copious watery evacuation, also as a vermifuge. Buchheim asserts that jalap is only purgative when combined with bile, in which the resin is soluble.

JALAPA, or XALAPA, the Aztec Xalapan, a town of Mexico, in the state of Vera Cruz, and about 70 miles inland from the city and port of that name, with which it communicates by a railway opened since 1870. There are few towns in Mexico which are so happily situated; at a height of 4500 feet above the sea, on the edge of the plateau behind which towers the summit of Macultepec, it looks out over the rich lowlands of the *tierra caliente*, enjoying their beauty and escaping their baneful vapors. The immediate vicinity is abundantly fertile, and yields a harvest of rare variety for the botanist. The town lost much of its importance as a commercial entrepôt by the opening of the railway from Vera Cruz *via* Orizaba to Mexico, but the line above mentioned may help to restore its prosperity. Of chief note among the public buildings are the principal church and the old Franciscan monastery, built in 1555. The population is stated at 10,000.

JALÁUN, a British district in the lieutenant-governorship of the North-Western Provinces of India, lies between 25° 46′ and 26° 26′ N. lat., and between 78° 59′ and 79° 55′ E. long., with an area of 1553 square miles, and forms the northern district of the Jhánsi division. It is bounded on the N. E. and N. by the river Jumna, on the W. by the Gwalior and Datia states, on the S. by the Samthar state and the river Betwa, and on the E. by Baoni state. The district lies entirely within the level plain of Bundelkhand, north of the hill country, and is almost surrounded by the Jumna and its tributaries the Betwa and Pahúj. The central region thus enclosed is a dead level of cultivated land, almost destitute of trees, and sparsely dotted with villages. The southern portion especially presents one unbroken sheet of cultivation. The boundary rivers form the only interesting feature in Jaláun. The little river Noh flows through the centre of the district, which it drains by innumerable small ravines instead of watering. Jaláun has little picturesqueness or beauty, but possesses great fertility and abundant agricultural resources.

The census of 1872 gives a population of 404,384, of whom 216,607 were males and 187,777 females. The principal tribes are the Bráhmans, the Kúrmis, the Gújars, the Kachhwáhas, the Lengars, the Kayaths, and the Musalmáns. There were four towns in 1872 with a population exceeding 5000:—Kálpi, 15,570; Kúnch, 14,448; Jaláun, 10,197; and Urái, 6398. The staple crops are the cereals, gram, and cotton. Oil-seeds, dye-stuffs, and sugar cane are also raised, but in no large quantities. Irrigation was employed in 1872 over 19,157 acres. Jaláun has suffered much from the noxious *káns* grass, owing to the spread of which many villages have been abandoned and their lands thrown out of cultivation. Drought is the great danger in Jaláun. The last important drought was that of 1868–69; no actual famine resulted, but great distress prevailed. Jaláun is almost entirely an agricultural district, and its trade accordingly depends mainly upon its raw materials and food-stuffs. Kálpi is the great mart of the district; Kúnch is also a considerable trading town. The river traffic by Kálpi is chiefly for through goods; and the Jumna is little used as a highway. A good commercial road connects Urái and Jaláun with Phaphúnd, the railway station on the East Indian line. There is also a great military road from Kálpi to Jhánsi. The administration is on the non-regulation system, which unites civil, criminal, and fiscal functions in the same officer. In 1860 there were 1434 children under instruction; in 1871, 2703. The climate, though hot and dry, is not considered unhealthy. The mean temperature is 81.9° Fahr. The prevailing diseases are fevers, and dysentery and other bowel complaints.

Jaláun seems to have been subject to the Nága dynasty, which lasted from the 1st to the 3d century of our era. In course of time the eastern portion fell under the power of the Chandels, while the western districts, including that of Jaláun, were ruled by the Kachhwáhas, a Rájput clan. These seem to have held most of the district until the invasion of the Bundelas in the 14th century. But the town of Kálpi on the Jumna was conquered for the princes of Ghor as early as 1196. Early in the 14th century the Bundelas occupied the greater part of Jaláun and even succeeded in holding the fortified post of Kálpi. That important possession was soon recovered by the Musalmáns, and passed under the sway of the Mughal emperors. Akbar's governors at Kálpi maintained a nominal authority over the surrounding district; and the native princes were in a state of chronic revolt, which culminated in the war of independence under Chhatar Sál. On the outbreak of his rebellion in 1671 he occupied a large province to the south of the Jumna. Setting out from this basis, and assisted by the Marhattás, he reduced the whole of Bundelkhand. On his death he bequeathed one-third of his dominions to his Marhattá allies, who displayed their usual alacrity in occupying their new territory, and before long succeeded in quietly annexing the whole of Bundelkhand. Under Marhattá rule the country was a prey to constant anarchy and intestine strife. To this period must be traced the origin of all the poverty and desolation which are still conspicuous throughout the district. In 1806 Kálpi was made over to the British, and in 1840, on the death of Náná Gobind Rás, his possessions lapsed to them also. Various interchanges of territory took place, and in 1856 the present boundaries were substantially settled. During the whole period of British rule before the mutiny, Jaláun only recovered its prosperity by very slow degrees. When the news of the rising at Cawnpur reached Kálpi, the men of the 53d native infantry deserted their officers, and in June the Jhánsi mutineers reached the district, and began their murder of Europeans. The natives everywhere revelled in the license of plunder and murder which the mutiny had spread through all Bundelkhand, and it was not till September, 1858, that the rebels were finally defeated. Since the mutiny the condition of Jaláun seems to have been steadily but slowly improving.

JALÁUN, a decayed town in the above district, and the former capital of a native state, is situated in 26° 8′ 32″ N. lat., 79° 22′ 24″ E. long. It occupies a large area, and contains a considerable number of good houses, and a ruined fort. The position is low, and swamps surrounding the town engender cholera and malarious fever, for which reason the headquarters of the district have been fixed at Urái. The population in 1872 was 10,197,—8824 Hindus and 1373 Mahometans.

JÁLNA, or JAULNA, a town in Hyderabad state, southern India, 19° 50′ 30″ N. lat., and 75° 56′ E. long., 240 miles northwest of Sikandarábád (Secunderabad), 38 east of Aurangábád, and 210 miles northeast of Bombay. It has a British cantonment, situated on a gentle declivity, at an elevation of 1652 feet above the sea, in an arid tract of country; the lines were built in 1827. Two miles southwest of Jálna is the old town of the same name, once the seat of a flourishing trade, but now rapidly decaying.

JÁLPÁIGURÍ, or Julpigoree, a British district of India, forming the northeastern part of the Rájsháhí Kuch Behar division, under the lieutenant-governor of Bengal, and lying between 26° 0′ 35″ and 26° 59′ 30″ N. lat., and between 88° 22′ 40″ and 89° 55′ 20″ E. long. It consists of an irregularly-shaped tract south of Bhután and north of the state of Kuch Behar and Rangpur district, with an area (1875) of 290,464 square miles. The district divides into a "regulation" tract, lying towards the southwest, and a strip of country, about 22 miles in width, running along the foot of the Himálayas, and known as the Western Dwárs. The former is a continuous expanse of level paddy fields, only broken by groves of bamboos, palms, and fruit-trees. The Western Dwárs are, for the most part, overgrown with grassy jungle, the secure home of large game, and are everywhere traversed by hill torrents, which, on the higher slopes, lose themselves beneath the sandy soil. The frontier towards Bhután is formed by the Sinchulá mountain range, some peaks of which attain an elevation of 6000 feet. It is thickly wooded from base to summit. The principal rivers, proceeding from west to east, are the Mahánandá, Karátoyá, Tístá, Jáldhaká, Duduyá, Mujnaí, Torshá, Káljáni, Ráidhak, and Sankos. The most important is the Tístá, which forms a valuable means of water communication. The Government forest reserves in the Western Dwárs cover a total area of 342.54 square miles. Lime is quarried in the lower Bhután hills. During the last few years tea-planting has been introduced, with every prospect of success.

The parliamentary abstract of 1878 gives a population of 418,665. The returns from the Dwárs were not drawn up in the form adopted for Bengal generally. The remaining part has a population of 327,985 (169,288 males and 158,697 females), comprising 25 Europeans, 7 Eurasians, 8 Chinese, 144 Nepálís, 553 aborigines, 148,043 semi-Hinduized aborigines, 32,155 Hindus according to caste, 2070 Hindus not recognizing caste, and 144,980 Mahometans. The great bulk of the population belongs to the semi-Hinduized tribe known as Koch or Rájbansí, which numbers 137,135, and is ascertained to form as much as two-thirds of the total inhabitants in the Western Dwárs. Rice is the staple crop in all parts of the district. Mustard-seed is extensively grown; cotton is the staple of the Dwárs, jute and tobacco of the regulation tract. Irrigation is common in the Western Dwárs. There is still some spare land uncultivated in the regulation tract; and in the Western Dwárs it has been estimated that about three-fourths of the land now waste is capable of cultivation. Of late years trade has been stimulated by the demand for agricultural produce from the south, and by the institutions of fairs on the Bhután frontier. The chief exports are jute, tobacco, timber, and rice; the chief imports are piece-goods, salt, and betel-nuts.

Education encounters great difficulties in Jálpáigurí, because the people are not gathered into villages, each family living in its own sequestered homestead. In 1875 the number of schools was 153, with 3263 pupils. The climate in the vicinity of Jálpáigurí town does not materially differ from that common to northern Bengal, except that the rainfall is heavier, and during the cold months fogs and mists are of daily occurrence. The average annual rainfall is over 100 inches; the average temperature is 76° Fahr. The climate of the Western Dwárs is markedly different; the hot weather disappears altogether, and the rains last continuously from April to October. The average annual rainfall at Baxá is 280 inches; the temperature averages 74° Fahr. The principal diseases are malarious fevers, splenitis, enlargement of the liver, diarrhœa, dysentery, and goitre. Of late years some very fatal outbreaks of cholera have occurred.

The district of Jálpáigurí first came into existence in 1869, when the Titályá subdivision of Rangpur was incorporated with the Western Dwárs, and erected into an independent revenue unit. The permanently settled portion of Jálpáigurí has no history of its own, apart from the parent district of Rangpur. The Western Dwárs became British territory as the result of the war with Bhután in 1864-65. The newly-acquired territory was immediately formed into the two districts of the Eastern and Western Dwárs, the former of which has since been incorporated with the Assam district of Goálpárá. The remainder, with the exception of a subdivision, was formed into the new district of Jálpáigurí with the addition of a portion taken from the unwieldy jurisdiction of Rangpur. Cultivation is now rapidly extending throughout the Dwárs; and it is believed that the population has been doubled during the ten years that have elapsed since British annexation. From motives of precaution, a regiment of native infantry is stationed in permanent cantonments at the hill pass of Baxá.

Jálpáigurí, the administrative headquarters of the above district, is situated on the west bank of the Tístá, in 26° 32′ 20″ N. lat., 88° 45′ 38″ E. long. This town has only risen into importance since the creation of the district in 1869, since which date its population has doubled. The population is estimated at between 4000 and 5000, including the regiment of native infantry in the cantonments, which lies south of the civil station.

JAM. See Jams and Jellies, p. 573.

JAMAICA, an island lying between the Caribbean Sea and the Gulf of Mexico, and about 80 miles to the southward of the eastern extremity of the island of Cuba, within 17° 40′ and 18° 30′ N. lat., and 76° 10′ to 78° 30′ W. long. It is the largest island of the British West Indies, being 135 (or, as sometimes stated, 144) miles in length and 21½ to 49 miles in breadth. Its area is about 4200 square miles, or, as stated in the Report of the Geological Survey, 3250 square miles. Within its government are comprised the three small islands called the Caymanas,—Grand Cayman, the principal of these lying off the centre of the Yucatan passage; British Honduras has a lieutenant-governor under the general government of Jamaica, although distant 660 miles, on the mainland of Central America; and Turks and Caicos islands, lying between 21° and 22° N. lat. and 71° and 72° 37′ W. long., were annexed to Jamaica in 1874.

Plate VIII.

The surface of Jamaica is usually hilly or mountainous, and there is a great variety of climate, according to situation and elevation. The largest extent of level land is to the westward, where the low lands are near the sea. The form of the coasts presents the outline of a turtle, the mountain ridges representing the back. The highest elevations are situated in the east, the inclined slope rising from the west. Vestiges of intermittent volcanic action occur. From the sea-level on all sides a series of ridges gradually ascend towards the central range, dividing the large rivers, and rising occasionally into peaks of 6000 feet. The Blue Mountains, running centrally from east to west, rise at some points to above 7000 feet. The vapors ascending from the rivers and surrounding ocean produce in the upper regions clouds saturated with moisture, which induce vegetation belonging to a colder climate. During the rainy season there is such an accumulation of vapor as to cause a general coolness over the island, and of course occasioning very sudden and heavy showers, and sometimes destructive floods. Upwards of one hundred and fourteen rivers or streams find their way from the interior of the sea, besides the numerous tributaries which issue from every ravine in the mountains. These streams for the most part are not navigable; in times of flood they become devastating torrents. In the parish of Portland, the Rio Grande receives all the smaller tributaries from the west; there is scarcely a mile width between any of these streams, and the land rises about 1000 feet to the mile. In St. Thomas in the east, the drainage of the main ridge is performed by the Plantain Garden river, the tributaries of which form deep ravines and narrow gorges in the mountains, which unite and descend, the valley of Plantain Garden expanding out into a most picturesque and fertile plain. Black River flows through a level country, and is accessible to small craft for about

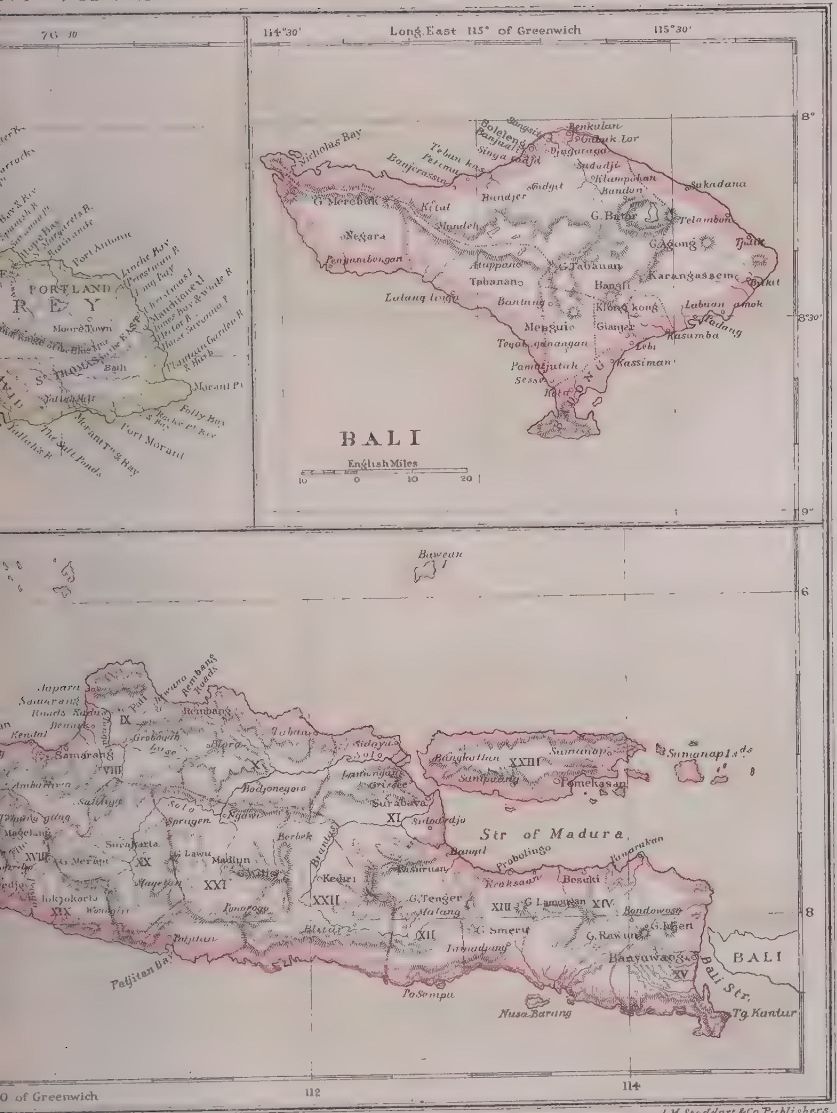
ND JAVA PLATE VIII.



J.M. Stoddart & Co. Publishers.

CA NINTH EDITION

30 miles. Salt River and the Cabarita, both also on the south side, are navigable by barges. The others on the south are the Rio Cobre (where irrigation works have been constructed for the sugar estates and provision and fruit growing in the district), Yallahs, and Rio Minho; on the north Martha Brae, the White River at Buff Bay, the Great Spanish River, and Rio Grande. There are several medicinal springs. Jamaica has sixteen harbors, the chief of which are Port Morant, Kingston, Old Harbor, Green Island, Montego Bay, Falmouth, Port Maria, St. Ann's Bay, Lucea, and Port Antonio, besides numerous bays, roadsteads, and shipping stations affording tolerable anchorage. The surface of the valleys and level lands consists of alluvial deposits composed of sediment derived from the disintegration of the higher land. The White Limestone formation seems to originate two descriptions of alluvia, one white and the other red, the color being due to oxide of iron combined with the argillaceous residue of the pre-existing limestone. The red soil is particularly favorable for coffee growing. The area occupied by the Coast Limestone and White Limestone represents about five-eighths of the island. The substructure of Jamaica consists of igneous rocks. In economic geology Jamaica produces a great variety of marbles, porphyrites, granite, and ochres. Traces of gold have been found associated with some of the oxidized copper ores (blue and green carbonates) of the Clarendon mines. Copper ores are very widely diffused, though the working of the veins has been found too expensive. Cobalt and lead have been worked, but hitherto unprofitably. Manganese occurs, also iron ores and a form of arsenic. There is a great variety (and at the same time great equability) of climate. In the lowlands the temperature rises from 75° at night to 85° in the day, and is tempered by the sea and land breezes. At Up-Park Camp, 225 feet above the sea-level, the mean temperature of the hottest month (July) was 81.71°, and of the coldest month (January) 75.65°. At Newcastle, 3800 feet, the hottest month was 67.75°, and the coldest 61°. The temperature therefore is very equable. In the higher levels the temperature may be 40° to 50°. In the plains there is much humidity. At Kingston the temperature ranges from 70° to 80° throughout the year. Parts of the island are extremely favorable for sufferers from tubercular disease. The island is generally healthy, though sometimes subject to yellow fever, like most tropical countries. Hurricanes, when they occur, come between July and October. The periodical rains, which generally last for six weeks, constitute the May and October seasons.

The vegetable productions are very numerous. There are forest trees fit for every purpose; among these are the ballata, rosewood, satinwood, mahogany, lignum vitæ, lancewood, and ebony. The logwood and fustic are exported for dyeing. There are also the Jamaica cedar, and the silk cotton tree (*Ceiba Bombax*). Pimento (peculiar to Jamaica) is indigenous, and furnishes the allspice. The bamboo, coffee, and cocoa are well known. Several species of palm abound—the macaw, the fan palm, screw palm, and palmetto royal. There are plantations of cocoa-nut palm. The Government are raising cocoa-nuts with profit on a barren spit of sand by the sea. Cinchona plantations have recently been successfully established in the mountains, the produce selling well in the London market. The other noticeable trees and plants are the mango, the breadfruit tree, the papaw, the lacebark tree, and the guava. The *Palma Christi*, from which castor oil is made, is a very abundant annual. English vegetables grow in the hills, and the plains produce plantains, cocoa, yams, cassava, ochra, beans, pease, ginger, and arrowroot. Maize and guinea corn are cultivated, and the guinea grass, accidentally introduced in 1750, is very valuable for horses and cattle,—so much so that pen-keeping or cattle farming is a highly profitable occupation. Among the principal fruits are the orange, shaddock, lime, grape or cluster fruit, pine-apple, mango, banana, grapes, melons, avocado pear, breadfruit, and tamarind. There are public gardens at Kingston, at Castleton, about 20 miles from Kingston, and at Bath, and an experimental plantation of different varieties of cane at Hope plantation. The sugar cane was cultivated at an early period, for in 1671 there were a number of sugar works. There are many beautiful flowers such as the aloe, the yucca, the datura, the mountain pride, the *Victoria regia;* the cactus tribe is well represented. Innumerable varieties of ferns grow in the mountains, and orchids in the woods. The sensitive plant grows in pastures.

There are fourteen sorts of *Lampyridæ* or fireflies, besides the *Elateridæ* or lantern beetles. There are no venomous serpents, but plenty of harmless snakes and lizards. The large lizard, the iguana, is eaten, as are also the land crab and tortoise. The scorpion and centipede are poisonous, but not very dangerous. Ants, mosquitoes, and sandflies swarm in the lowlands. Gosse enumerates twenty different song birds in Jamaica. Parrots, pigeons, guinea fowl, and a great variety of water birds are found. The sea and rivers swarm with fish, and turtles abound. The seal and manatee are sometimes found, and the crocodile. The domestic animals are those of the ordinary English kind. Jamaica beef and pork are very good. Poultry succeeds well.

The population was returned in the census of 1844 as 380,000, of whom 16,000 were white, 68,000 colored, and the rest black. In 1861 it was returned at 441,000, of whom 14,000 were white, 80,000 colored, and 347,000 black. In 1871 the numbers were 13,000 white, 100,000 colored, 393,000 black; total 506,000. The census of 1881 will probably show a total of 600,000,—a large increase in the black and colored population, and a stationary if not reduced number of white people.

The total value of imports was £1,492,722 (including £757,077 from the United Kingdom) in 1878, and £1,347,342 in 1879—amounts considerably below the values for the preceding six years, in four of which it was above £1,700,000. The imports consist principally of provisions for consumption, a considerable proportion coming from the United States. The total value of exports in 1878 was £1,210,705 (£954,584 to the United Kingdom), consisting of 9,572,714℔ of coffee (an extending industry), 908,603℔ of ginger, 6,195,109℔ of pimento, 18,115 puncheons of rum, 26,066 hhds. of sugar, and 35,157 tons of logwood. The total value is below that of the six preceding years. The sugar exported was below the average of preceding years; but in 1879 sugar exports rose again to 29,000 hhds. The value of the fruit exported (principally to United States) had risen from £9337 in 1875 to £39,451 in 1878. The total exports for 1879 were £1,357,571 value. The area under crops in 1878 was 121,457 acres, in guinea grass 120,264, in pasture 318,549, in wood and runate 1,217,596, leaving 942,134 acres of the total extent to be accounted for as unpatented primeval forest or rocky land of no value. One of the newest industries, besides cinchona, is the growth of excellent tobacco; Jamaica cigars are now becoming well known in England. The public revenue for 1878 was £438,564, and the appropriated revenues from roads, poor rates, etc., £74,900, making a grand total of £512,465, or about 18s. per head of the population. The estimates for 1880 showed a public revenue of £469,875 and appropriated £72,580, total £542,455. £245,000, or more than half the public revenue, is raised from import duties, and £94,000 from rum duties; the railway receipts (Government having purchased the line by loan with a view to extension) for 1880 were estimated at £23,000. The remainder comes from licenses, postal revenues, and other sources. The public expenditure for 1879 was £460,154, the appropriated £73,050, total £533,204, and the estimated expenditure for 1880—public £485,655, appropriated £72,580, total £558,235. The main items of expenditure are—debt charges and sinking funds and redemption, £73,000; administrative departments, £33,000; revenue departments, £33,000; judicial, £36,000; ecclesiastical, £10,000 (the church has been disestablished, and the expenditure will be gradually less as vested interests disappear); medical, £55,000; constabulary, £50,000; penitentiary and prisons, £25,000; education, £25,000; railway managing, etc., £14,000; public works and irrigation, £58,000.

In 1878, 617 schools underwent inspection by the Government; 51,488 children were on the books, the average attendance being 29,679. Of these schools, 54 passed first class, 176 second class, and 343 third class. The average Government grant to each school aided during the year was £29, and the total education grant, exclusive of departmental salaries, was £18,572. Elementary education has made progress during the eleven years the present system has been in operation. The collegiate school in Kingston offers higher education. Among educational institutions, the Church of England high school, the Calabar institution or Jamaica Baptist College, and Wolmer's free school, founded in 1729 by John Wolmer for the free education of poor children, as well as the Mico School, require mention. The ecclesiastical establishment is regulated by Law No. 30 of 1870 which provided for gradual disendowment. This law created a synod, to consist of clergymen and lay representatives, and it continued to each existing rector, island curate, and stipendiary curate the payments from the state so long as they fulfilled their functions. Under this law the estimates for 1880 show as still on the establishment five rectors, twenty island curates, and three stipendiary curates, the total amount for the Church of England being £9749; this, with £367 to the Church of Scotland, and £100 to the church of Rome, makes up the ecclesiastical establishment. Besides the state paid clergymen, there are about forty clergymen paid out of the Diocesan Church Fund. Besides three American church missionaries at Kingston, there are about twenty Presbyterian ministers, thirty Wesleyan, eight of the London Missionary Society, fifty Baptist, one Independent, six United Methodist Free Church. The Moravians have fourteen stations and seventeen missionaries. There are two synagogues.

Kingston, the capital is on the south coast. It was founded in 1693, and is built on a plain which rises from the shore with a gradual ascent to the foot of the Liguanea mountains. This plain is covered with country residences and sugar estates. The town population in 1871 was 4393 whites, 13,291 colored, and 16,630 blacks. It is now estimated at over 40,000. The seat of government was recently transferred from Spanish Town to Kingston, and the principal civil and judicial business is transacted there. The chief retail business street is Harbor Street. Port Royal Street is the chief thoroughfare of the wholesale merchants, who keep wharves which line the seaboard of the town. The public buildings possess little architectural interest. The Victoria Market (opened in 1872) and public landing-place at the foot of King Street (where Rodney's statue was brought from Spanish Town), form a very fine market-place. The court-house in Harbor Street is a handsome building. The public hospital (with 170 beds), the law library, the chancery registrar's office (with its piece of tapestry of the royal and island arms, which used to be carried before the governor on state occasions), the court of vice-admiralty, the public library and museum in East Street, are also worthy of mention. The parish church in King Street is one of the oldest churches in the island, dating probably from 1692. It contains the tombs of William Hall (1699) and Admiral Benbow (1702). The only bank is a branch of the Colonial Bank, besides the Government Savings Bank. Up-Park Camp, to the north-east of the city, is the headquarters of a West India regiment.

Jamaica was discovered by Columbus and possession taken in the name of the king of Spain on the 3d of May, 1494. He called it St. Jago, but it is known by its Indian name Jamaica, "the isle of springs." It is sometimes written Xamayca. The inhabitants belonged to the gentler Indian tribes, not to the fierce Caribs. In June, 1503, Columbus was driven by a tempest into a bay on the north side, now St. Ann's Bay. After his departure the island remained unvisited until 1509, when his son Diego, having established his right in the council of the Indies to the governorship of Hispaniola, sent Don Juan d'Esquivel to take possession of the island, in opposition to Alonzo d'Ojeda, who claimed it under a royal grant. Thenceforward, under the rule of the Spaniards, the Indian population diminished, until in 1655, when the island fell into the possession of the English, the race was practically extinct. The controversy respecting the rights of the descendants of Columbus continued for a long time. About the year 1523 Diego Columbus founded St. Jago de la Vega, St. James of the Plain, which was the official capital, under the name of Spanish Town, until Kingston was recently selected. Attention had been gradually given to agriculture, the cotton plant, sugar cane, and various kinds of corn and grass having been introduced. In 1596, during the alliance of Queen Elizabeth with the Low Countries, and the consequent war with Spain, Sir A. Shirley, a British admiral, invaded Jamaica, but made no attempt at occupation. In the reign of Charles I. Colonel Jackson defeated the inhabitants at Passage Fort. Shortly afterwards the island was divided into eight districts in the nominal possession of eight noble families, and the total population became extremely small. The next important event was the expedition sent by Cromwell, under Admirals Penn and Venables; failing against Hispaniola, they took possession of Jamaica on the 3d of May, 1655, the island having been in the possession of the Spaniards one hundred and sixty-one years. Under Cromwell emigrants were sent from Scotland and Ireland and other places. But the Spaniards and their negroes harassed the new comers, who died in considerable numbers. On the 8th May, 1658, an attack from Hispaniola was defeated, and soon after the remaining Spaniards were driven from the island. The slaves, called Maroons, however, who had fled to the mountains, continued formidable. Down to the end of the 18th century the disaffection of these Maroons caused much trouble. In 1661 a regular civil government was established, Colonel D'Oyley being appointed governor-general with an elective council. Next year he was succeeded by Lord Windsor, who was instructed to summon a popular assembly to pass laws. Jamaica became the resort of the buccaneers, who carried on a profitable piracy of these seas during the war with Spain. In 1670 peace was made with Spain, and the English title was recognized by the treaty of Madrid. The buccaneers were suppressed. In 1672 the Fourth or Royal African Company was formed to carry on a monopoly of the slave trade. From 1700 to 1786 the number of slaves imported was estimated at 610,000, of whom one-fifth were re-exported. In 1673 the governor sent home the first pot of sugar to the secretary of state; at this time there were 7768 whites and 9504 negroes on the island. In 1678, while the Earl of Carlisle was governor, an attempt was made to saddle the island with a yearly tribute to the crown, and to restrict the free legislative power of the assembly. The privileges of the assembly, however, were restored under Sir Thomas Lynch in 1682; it was not until 1728 that £8000 (currency) a year was settled on the crown, and the laws and statutes of England were made equally applicable to Jamaica. This amount was afterwards commuted for £6000, used by the governor for salaries, allowances, and contingencies. In 1854 this fund was merged in the ordinary civil list. The other principal event in the general history of Jamaica was the threatened invasion in 1782 by the combined fleets of France and Spain under De Grasse. It was saved by the victory of Rodney and Hood, off Dominica, in commemoration of which event a statue of Rodney, by Bacon, was erected in Spanish Town.

A great earthquake occurred in 1692, when the chief part of the town of Port Royal, built on a shelving bank of sand, slipped into the sea. In 1712 and 1722 there were dreadful hurricanes, the last causing the seat of commerce to be transferred from Port Royal to Kingston. Since then there have been a number of hurricanes, the most recent being in August, 1880, when considerable damage was done to crops, provision grounds, churches, chapels, and school-houses in the eastern part of the island.

Since 1800 the history of Jamaica has been, with some exceptions (such as the defeat by Admiral Duckworth in 1806 of the French squadron intended to invade Jamaica), confined to its domestic concerns and its relations with the mother country. In 1807, when the slave trade was abolished, there were 323,827 slaves in the island. The island was very prosperous,—sugar, coffee, cocoa, cotton, pimento, ginger, and indigo being produced; and it was also the depôt of a very lucrative transit trade between Europe and the Spanish main. The anti-slavery agitation in England, growing stronger every year, caused great excitement in the island, and there was much violence and misrepresentation on both sides of the question. The negroes revolted in 1832, under the belief that emancipation had been granted; many hundreds of lives were sacrificed, a large amount of property destroyed, and various atrocities were committed. This stimulated the agitation in England, and in 1833 the Emancipation Act was passed, the period of apprenticeship being ultimately reduced to four years. Of the £20,000,000 compensation, £6,161,927 was awarded to Jamaica, being about £19 a head on a slave population of 309,338. The wisdom of the manner in which the emancipation policy was carried out by England has been often questioned. During Sir Lionel Smith's administration, on the 1st of August, 1838, the apprenticeship came to an end, and entire emancipation was effected by an Act of the assembly. Difficulties arising between the British Government and the assembly as to the Prisons Act, a bill was introduced by Mr. Labouchere (Lord Taunton) into the House of Commons to suspend the constitution of Jamaica, the rejection of which measure occasioned the resignation of Lord Melbourne's ministry. The dispute was afterwards compromised, and under the government of Sir Charles Metcalfe an improved state of things was brought about. Education and religious instruction and better administration of justice were subjects of attention, together with schemes of agriculture to develop the varied resources of the island. The want of cheap and continuous labor was, however, a great obstacle. The introduction of laborers from Africa was objected to in England as a renewal of the slave trade. Coolie immigration was fenced about with such expensive restrictions by the home Government that no large or comprehensive scheme was possible. The earl of Elgin continued Sir C. Metcalfe's policy, and a railway was opened, 12 miles long, between Kingston and Spanish Town, but the prospects of the colony became exceedingly gloomy under the effects of the legislation of 1846 equalizing the duties on free and slave sugar. The advantages of slave labor in Cuba were so great that the utmost economy and skill of practical resident planters in Jamaica failed of success. Differences between the assembly, the council, and the home Government on the means of retrenching the public expenditure, created much bitterness of feeling, and most disastrous results were brought about, affecting seriously the credit of the island, by the assembly refusing to perform its functions and renew duties necessary for revenue. An outbreak of cholera added to the confusion and gloom. The result of this controversy was that the home Government offered an imperial guarantee for a loan of £500,000 and other financial assistance, conditionally on permanent provision being made for official salaries, on the initiation of all money grants by the crown, and on certain members of the legislature being held responsible for the expenditure of the public money. Sir Henry Barkly had the task of carrying out these arrangements. In 1854 the Incumbered Estates Act was passed, under which in recent years considerable sales of property in Jamaica have taken place. During the next decade the island was tranquil, but very much depressed. Many white people, of a superior class, had left. Public business suffered by the recriminations in the assembly, and by want of economy and good management (causing annual deficits) of the public finances. But in 1865 an event occurred which opened a perfectly new chapter in Jamaica history. On October 20 Governor Eyre reported to the secretary of state (the present Lord Cardwell) a "serious and alarming insurrection of the negro population." In this despatch the letter written by Dr. Underhill, the secretary of the Baptist Society, was referred to as causing public meetings to be held, and giving rise to excitement. Dr. Underhill subsequently asserted that it was through Governor Eyre his letter became public. The letter referred to the distress among the population, to alleged unjust taxation, to the alleged refusal of just tribunals, to the denial of political rights to the emancipated negroes. The despatches of Governor Eyre caused much discussion and excitement in England, and under date of 30th December, 1865, a royal commission was issued to inquire into the disturbances. The commissioners—Sir Henry Storks (sent out as governor), Mr. Russell Gurney, and Mr. J. B. Maule—began their work on January 23, 1866, and sat for fifty-one days. They reported on the 9th April that the disturbances in St. Thomas in the east had their immediate origin in a planned resistance to lawful authority, arising from the desire to obtain land free of rent, want of confidence in tribunals, feelings of hostility towards political and personal opponents, while not a few contemplated the death or expulsion of the white inhabitants. Had more than a momentary success been obtained, the ultimate overthrow of the insurgents would have been attended with a still more fearful loss of life and property. The commissioners attributed the speedy termination of the outbreak to the skill, promptitude, and vigor of Governor Eyre in the early stages; they viewed the military and naval operations as prompt and judicious; but they thought martial law was continued too long, and that the punishments inflicted were excessive. The commissioners expressed an opinion that the conduct of Gordon, a member of the assembly, whose trial by court martial and execution caused great controversy in England, had been such as to convince both friends and enemies of his being a party to the rising, yet they could not see any sufficient proof either of his complicity in the outbreak at Morant Bay, or of his having been a party to a general conspiracy. The case was warmly taken up in England by the Jamaica committee under the leadership of Mr. J. S. Mill. A charge was made against Mr. Eyre, resulting in an elaborate exposition of martial law by Chief Justice Cockburn, and the stoppage of the prosecution by the grand jury ignoring the bill. On the 20th December, 1866, the assembly passed an Act rendering it lawful for the Queen to create and constitute a Government for the island; the same was passed by the council on the 22d, and on the 23d it received the governor's consent.

Thus the constitution which had existed for two hundred years was swept away. It was composed at the time of a governor, a privy council, a legislative council, an assembly of forty-seven elected members, and a paid body called the executive committee, who were practically responsible ministers of the crown, holding office at the governor's pleasure. The present constitution is that of an ordinary crown colony. It was established by an imperial Act, and an order in council, dated 9th April, 1866, and subsequent orders. There is only one chamber, called a legislative council. In 1880 this consisted of the governor as president, eight officials (viz.: colonial secretary, senior military officer, attorney general, director of roads, collector general, auditor general, assistant colonial secretary, and crown solicitor), and eight non-officials, nominated by the crown,—all councillors holding office at the royal will and pleasure. No proposal is admitted or debate allowed on any matter affecting revenue, unless introduced by the governor or by his direction. Sir J. P. Grant was governor from 1866 to 1874, and reforms and changes were vigorously effected. The revenue was better collected. Irrigation and other public works were begun. But the sugar industry has continued in a state of great depression, though Sir A. Musgrave, who was appointed governor in 1877, reported in 1880 that the public debt had been reduced from £719,000 to £485,000 (excluding loans for special purposes), that there had been no increase of taxation since 1867, that savings banks deposits had increased from £58,913, in 1868 to £207,000 in 1879 (the Government paying interest at 4 per cent.), and that the industrious negroes, especially those with small holdings growing provisions, coffee, cocoa, or possessing small sugar mills, were fairly prosperous. These results are attributed by officials to the change from representative to crown government, although the latter has been much criticized as too arbitrary, and tending to a narrow officialism. The number of parishes for purposes of local government has been reduced from twenty-two to fourteen. Each parish has its own hospitals, almshouses, etc., managed by its municipal board, the chairman of whom is the custos, nominated by the governor. The members are appointed by the custos, subject to the governor's approval. Each parish also has a road board. The judicial establishment consists of the chancellor (the governor), a vice-chancellor and chief justice, two puisne judges of the supreme court, attorney general, crown solicitor, etc.; there are seven district courts, somewhat on the model of county courts in England, the judges being barristers sent out from England. There are also four stipendiary magistrates, and a police magistrate for Kingston. The constabulary was placed on its present footing in 1867, and is modelled on the system of the Irish (semi-military) constabulary. Parochial medical officers paid by Government attend the parochial institutions, constabulary, and immigrants. These officers are allowed private practice in addition. The island is in telegraphic communication with England, and indeed with the world, and has also an inland telegraphic service. The Government have purchased the 25 miles of railway from Kingston to Old Harbor, and are about to construct 47 miles more. Steam communication is very frequent between England, United States, and the colony.

JAMES (Ἰάκωβος). This name, the Hebrew *Yakob* or Jacob, belongs to several persons mentioned in the New Testament, of whom the first that appears in the Gospels is

1. *James the son of Zebedee.* He was among the first who were called to be Christ's immediate follow-

ers and afterwards chosen to be his apostles, and is one—the others being Peter, Andrew, and John (the brother of James)—of the always first-mentioned and, as the narrative shows, most remarkable group of the apostolic band. In all the enumerations of the twelve (Matt. x. 2; Mark iii. 17; Luke vi. 14; Acts i. 13), his name appears early in the list, twice occupying the second place after Peter's. The call of James and John (the fullest account of which is given in Luke v. 1–11; comp. Mark i. 20) took place on the same occasion when Peter and Andrew, the other pair of brothers, were taken from their humble fisher's trade to be fishers of men. After this we next find James noticed as one of the persons present (Mark i. 29) when Jesus restored Simon Peter's wife's mother, who was sick of a fever.

His brother and he were surnamed by our Lord (Mark iii. 17) "Boanerges," a name derived from two Aramaic words signifying "Sons of thunder," as it is interpreted by the evangelist. The name has been explained as having reference to the powers of their eloquence in preaching, or even from their being present when the voice like thunder spake to Jesus from the cloud (John xii. 29). It is more probable, especially as one meaning of the word translated "thunder" is "rage, anger," that the name was given to them by the Lord because he perceived the fiery impetuosity of their nature. Two instances (Luke ix. 54; Mark x. 32–41) are recorded in the Gospels from which we can discern somewhat of this character of the sons of Zebedee.

James is included among those who after the ascension waited at Jerusalem (Acts i. 13) for the descent of the Holy Ghost on the day of Pentecost. This is one of the passages in which the name of James is placed before those of John and Andrew, and we may judge from the little we are told of him subsequently that he was a most zealous and prominent member of the Christian community. For when a victim is to be chosen from among the apostles who should be sacrificed to the animosity of the Jews, it is on James that the blow falls first. The brief notice is given Acts xii. 1, 2: "Now about that time Herod [Agrippa I.] the king put forth his hands to afflict certain of the church. And he killed James the brother of John with the sword."

Eusebius (*H. E.*, ii. 9) has preserved for us from Clement of Alexandria the circumstance that the accuser of the apostle, "beholding his confession and moved thereby, confessed that he too was a Christian. So they were both led away to execution together, and on the road the accuser asked James for forgiveness. Gazing on him a little while, he said, 'Peace be with thee,' and kissed him. And then both were beheaded together." Other legends which tell of the apostle's preaching in Spain, and of the translation of his body to Compostella, are to be found in the *Acta Sanctorum*, July 25 (vol. vi. pp. 1–124).

2. *James the son of Alphæus.* He also was one of the apostles, and is mentioned in all the four lists (Matt. x. 3; Mark iii. 18; Luke vi. 15; Acts i. 13) by this name, but in no other place. It is, however, thought by some that he is the same with

3. *James the Lord's brother.* In Matt. xiii. 55 and Mark vi. 3 the brethren of the Lord are named James, Joses, Judas, and Simon. It is also to be remarked that they are in both places spoken of as the children of the carpenter, that is, of Joseph the husband of the Virgin Mary. But it has been urged that they were called sons of Joseph and Mary because the children of two families,—of Mary the Virgin and Mary the wife of Clopas, her half sister,—were brought up together. Those who in this way make James the Lord's brother to be a son of Alphæus require to establish (*a*) that Clopas is the same name as Alphæus, (*b*) that Mary the wife of Clopas (John xix. 25) was the sister of the Virgin Mary, and (*c*) that this Mary, wife of Clopas, is the same who is called (Matt. xxvi. 56; Mark xv. 40) Mary the mother of James and Joses, and (Mark xvi. 1; Luke xxiv. 10) simply the mother of James, in which four passages the same person is evidently intended. But the identity of the names Alphæus and Clopas is by no means certain. Those who maintain it take Clopas as the Aramaic Chalpai, and Alphæus to be a Græcized form thereof. But when we turn to what might be supposed the best source of evidence on this point, viz., the Peshito version of the New Testament, instead of finding the two names treated as the same word, we find in all cases Chalpai where the Greek has Alphæus, and where Clopas or Cleopas occurs, it is simply transliterated Kleopha. The same is the case with the Jerusalem Syriac.. The identity of these names is thus far from being established. Then in John xix. 25 the versions and best authorities are in favor of making four persons of those there mentioned: "his mother and his mother's sister, and Mary the wife of Clopas and Mary Magdalene." This is the Peshito rendering, and, even if the conjunction were not there, it is not uncommon in Scriptural enumeration to find names given in pairs without any conjunction, while to make Mary the wife of Clopas the Virgin's sister would be to assume two Marys in the same family of sisters, which is not very probable. Whether Mary wife of Clopas was the mother of a James (called in one place "the little") and of Joses can neither be asserted nor denied from the evidence in the Gospels; but, when the other two assumptions have so little foundation to rest on, it seems impossible to consider the son of Alphæus the same person with the "brother of the Lord."

Further, James, the Lord's brother, was bishop of Jerusalem (comp. Gal. i. 19 with Gal. ii. 9–12), and was president of the church in its earliest days (Acts xii. 17, xv. 13, xxi. 18). Such a position required him to be a resident in Jerusalem, while had he been an apostle (as the son of Alphæus was) we should have expected, him to take his share of the missionary labor of publishing the gospel in distant lands. But this bishop of Jerusalem was the author of the epistle of St. James. He simply styles himself in the introduction thereto "a servant of God and of the Lord Jesus Christ." He who could thus write with the certainty of being identified must have been the most famous person of his name in the church, must have been what St. Paul, in a passage (Gal. ii. 9) where he places James before both Peter and John, calls him, "a pillar" of the Christian society. And again Jude when commencing his epistle, calls himself the brother of James, with no other mark of distinction. Here too the same James must be intended, and when we read St. Jude's epistle (17, 18) we find him distinguishing himself from the apostles, and as it were disclaiming the apostolic dignity. This is as it would be if James and Jude were both brethren of the Lord and were not apostles, but we should certainly expect one or other would have left some indication in their letters had they been of the number of the twelve, and most surely neither of them would have been likely to give us reason for believing that he was not an apostle.

The two passages (1 Cor. xv. 7; Gal. i. 19) from which it might be argued that James the brother of the Lord was an apostle cannot be relied on, for we find the same title given to Barnabas, and it is certain that the name "apostle" began to be more widely applied after the ascension than it is in the Gospels.

Once more, the brethren of the Lord are expressly said (John vii. 5) not to have believed on Jesus at a period much later in his ministry than the appointment of the twelve; while in the mention of them in Acts i. 14 there is given first a list of the eleven, who are said all to have "continued in prayer with the women and Mary the mother of Jesus and with his brethren." Such a studied severance of the brethren of the Lord from the number of the apostles is very significant, while the position which they hold in the list may well be due to the fact that it was only at a late period that they had become disciples of Jesus. The change in their opinions has been thought by many to be sufficiently accounted for by the statement of St. Paul (1 Cor. xv. 7) that after his resurrection Jesus "was seen of James." Such a demonstration of the truth of what others had long believed and Jesus himself had taught could not fail to work conviction on a mind which, if we may accept the tradition of the "Gospel according to the Hebrews" (which also testifies to this appearance of Christ to James), was somewhat inclined to believe, even before the crucifixion.

It seems right therefore to conclude that James the son of Alphæus, one of the apostles, was a different person from James the Lord's brother and bishop of Jerusalem. Of the history of the former we are told nothing except that he was an apostle. The latter is spoken of by St. Peter (Acts xii. 17) as if he were at that time the recognized head of the Christian community in Jerusalem. Again (Acts xv. 13), after the debate at Jerusalem about the circumcision of the Gentiles, it is he who sums up the arguments and declares the sentence of the council, as if he were the chief person among them. In Acts xxi. 18, on St. Paul's last visit to Jerusalem, he holds the same position, and receives the visit of St. Paul in the presence of all the presbyters. In Gal. i. 19, ii. 9 he is placed foremost among "the pillars" of the church of Jerusalem.

From the New Testament we learn no more of the history of James the Lord's brother, but Eusebius (*H. E.*, ii. 23) has preserved for us from Hegesippus the earliest ecclesiastical traditions concerning him. By that authority he is described as having been a Nazarite, and on account of his eminent righteousness called "Just" and "Oblias." So great was his influence with the people that he was appealed to by the scribes and Pharisees for a true and (as they hoped) unfavorable judgment about the Messiahship of Christ. Placed, to give the greater publicity to his words, on a pinnacle of the temple, he, when solemnly appealed to, made confession of his faith, and was at once thrown down and murdered. This happened immediately before the siege. Josephus (*Antiq.*, xx. 9, 1) tells that it was by order of Ananus the high priest, in the interval between the death of Festus and the arrival of his successor Albinus, that James was put to death; and his narrative gives the idea of some sort of judicial examination, for he says that along with some others James was brought before an assembly of judges, by whom they were condemned and delivered to be stoned.[1]

Other less important bearers of this name are (4) James, of whom all we know is that he was the "son of Mary" (Matt. xxviii. 56; Mark xv. 40, xvi. 1; Luke xxiv. 10) and the brother of a certain Joses (comp. Mark xv. 40 with xvi. 1), and that he is called "the little," ὁ μικρός (A. V. "the less," wrongly); and (5) James, who was either the father or brother of Judas, one of the apostles. The Greek gives (Luke vi. 16; Acts i, 13) "Judas of James." The ellipsis may, as has been shown by Winer, be supplied either by the word "father" or "brother." The A. V. supplies "brother." But, as in both these lists within a line of the name of this Judas a similar form "James of Alphæus" occurs, which is in both places rendered James the "son" of Alphæus, as it is also in both the other lists of the apostles in St. Matthew and St. Mark, it seems natural to suppose that the evangelists intended the same noun to be supplied in both cases. If this be so, the James here mentioned would be a person otherwise unknown, but the father of the apostle Judas, who is distinguished as Lebbæus and Thaddeus, and also by St. John (xiv. 22) as "Judas not Iscariot."

JAMES, THE GENERAL EPISTLE OF. Of the author of this epistle enough has been said in the previous article (3); it only remains to add in connection with the introductory words thereof that probably the same reason actuated both St. James and St. Jude to leave out any mention that they were "brethren of the Lord." We need not enter into the question of what relationship is intended by those words, though, from the mention of Joseph on each occasion where the "brethren" are spoken of, it is probable that they were really his children by a former marriage. Thus Jesus would be younger than those who are called "his brethren," and their behavior in rejecting his teaching for so long a time may have been partly a result of their growing up with him and regarding him as a younger member of the same family, and from familiarity becoming less willing than strangers would be to acknowledge anything which looked like an assertion of superiority. But, whatever the reason for their former unbelief, it is easy to see that, when they had at length come to own Jesus as their Lord, humility would check the mention of the relationship in which they might claim to stand to Jesus, as would also a desire not to appear to place themselves in a position of close connection with Christ, to which none others could lay claim.

The epistle is addressed "to the twelve tribes which are of the dispersion." The word "dispersion" (*διασπορά*) was employed in the New Testament times to signify the Jewish population in every part of the then known world. Jews were to be found in Persia, Egypt, Asia Minor, and indeed in all the lands surrounding the Mediterranean Sea. When the writer addresses them as "the twelve tribes" he gives us the key to the character of his epistle. It was written to Christians who had been converts from Judaism, but to whom their ancient faith was still of the very highest importance, indeed, of somewhat more importance than it ought to have been. We can see therefore why the language of this epistle partakes so largely of the character of the preaching of John the Baptist (comp. Jas. i. 22, 27 with Matt. iii. 8; Jas. ii. 15, 16 with Luke iii. 11; Jas. ii. 19, 20 with Matt. iii. 9; and Jas. v. 1–6 with Matt. iii. 10–12) and of that of our Lord's earliest teaching in the Sermon on the Mount (*cf.* especially Jas. i. 2, 4, 5, 9, 20; ii. 13, 14; iii. 17–18; iv. 4, 10, 11; v. 2, 10, 12, 15), and why it is so largely illustrated by the language of books like Ecclesiasticus and the Book of Wisdom, which were specially esteemed by the Jews of Alexandria and other Hellenistic centres of Judaism (see Jas. i. 1, 5, 8, 11, 12, 17, 19, 20, 23, 25; ii. 21; iii. 5, 6; iv. 14). We should judge from this that the bishop of Jerusalem, in the earlier days of the Christian church, availed himself of his central position to circulate among the scattered Judæo-Christian populations, of whom representatives would constantly be within his reach, such a letter as was suited to stimulate the new converts to more truly Christian life, and to check errors into which, from their attachment to the older faith, they were prone to fall. The epistle contains many exhortations to accept a higher standard for the conduct of life, though a considerable section (i. 22–ii. 26) applies more specifically to the dangers that beset Jewish converts of trusting to a faith which produced no results in the form of Christian love.

But it was not only for those who were scattered into distant parts of the world that the epistle was written. It bears marks of its relation to a time of special trial and hardship, and has much to say of how trials and sufferings are to be borne. "Count it all joy when ye fall into divers temptations" is the opening language; and the writer returns to the same theme at the close of his letter; "Be ye also patient," "Stablish your hearts," "Behold, we count them happy which endure." Such words agree best with the dispersion of the first Christian brotherhood after the death of Stephen, and with that persecution by Herod Agrippa I. in which James the brother of John was put to death. It is an additional indication that the epistle was written about those times that in it there is no word of that contention which soon agitated the whole Christian church about the circumcision of the Gentiles, and about which James pronounced the sentence of the council of Jerusalem in 51 A.D. The persecution which ensued on the martyrdom of Stephen (33 A.D.) is too early a date after the ascension for us to think it probable that Christianity could have had enough representatives among the dispersion to make such an epistle as the present necessary. It seems better therefore to refer it to that larger persecution in which the one James suffered death, and after which the other James comes into special prominence in Christian church history. This would lead to the conclusion that the epistle, primarily addressed to the Jewish Christians throughout Palestine, but intended also for others who lived beyond the limits of the Holy Land, was written at Jerusalem, from which James the Just seems never to have departed, and that it should be dated some time after 44 A.D., the date of Herod's persecution, and antecedent probably by several years (for the agitation which led to the council must have existed for some time) to the council at Jerusalem (51 A.D.).

---

[1] For a discussion of these traditions, and on the question whether the text of Josephus is interpolated, consult Credner, *Einleitung*, p. 581; Hilgenfeld, *Einl.*, p. 523 *seq.*; Wieseler in *Jahrb. f. D. Theol.*, 1878, p. 99 *seq.* Compare also Jerome's account of James in his book *De vir. ill.*, 2, where further traditions from the Gospel according to the Hebrews are given.

The epistle contains nothing to indicate where it was written, but at the same time there is nothing in the imagery and illustrations employed by the writer which would be out of character with one writing in Palestine. It is therefore probable that, since tradition represents James as constantly resident in Jerusalem, the epistle was written there. He uses the Jewish name "synagogue" (ii. 2) for the place of assembly for worship, which would perhaps be longer preserved among the Christians in Jerusalem than elsewhere; but on the other hand he speaks (v. 14) of the "elders of the church" (ἐκκλησία) just as we find St. Luke doing in the Acts of the Apostles. He mentions the "burning wind" (καύσων) spoken of in the Gospels (Matt. xx. 12; Luke xii. 55), and his language (iii. 4) about ships and the storms by which they are driven is such as would be natural in one who knew by experience of the tempests that sometimes sweep suddenly over the Sea of Galilee, with which this James must have been familiar as well as the son of Zebedee.

The epistle appears to have been written with a view, in the first place, to comfort some who were undergoing severe trials. This is clear from the opening sentence, "Count it all joy when ye fall into divers trials." But the words also seem to show that there was a spirit prevailing among those for whom the letter was first intended which did not tend to that perfect patience under sufferings that should characterize the faithful Christian. And so the writer passes on to notice a want of perfect trust in God, and a too great regard for temporal things, concerning which they are exhorted to foster such a mind as shall make changes in worldly affairs, when they are for the worse, yet still no cause for sorrow. For the only perfect gifts are of God's own sending, and in His gifts as in Himself there is no change. The epistle next dwells on that which was the great danger with Jewish converts, the profession of a belief in God and Christ without a corresponding Christian life; they are further exhorted to avoid sins of the tongue and sins of presumption, while those to whom wealth had become the chief object in life are severely condemned. But before the close the writer turns once more to his first theme, the commendation of patience under sufferings, which he enforces by the examples of the prophets and of Job. Then with certain cautions about the use of oaths, some precepts for conduct under sorrow, joy, sickness, or the consciousness of sin, the epistle is brought to a close, and has not the apostolic benediction, a feature which also marks the letter as one of the earliest of the Christian writings. The time of trial alluded to suits well with the date which has been suggested, when Herod's persecutions made it necessary for the Christians in Jerusalem to meet in secluded rooms, and to exercise the utmost precaution about all whom they admitted to their meetings. We know too, from the statements of Josephus, that it was from the wealthy Sadducees that the Christians in Jerusalem experienced most persecution, and that they especially were adverse to Christianity because of the preaching of the resurrection of Jesus. The followers of Jesus were, as we know, at this time just beginning to be called Christians, and this name soon became (if it was not at first given as) a name of reproach. These circumstances seem to be specially noticed in this epistle (ii. 6, 7). To the necessities of those days then the letter appears to be first directed, though it contains precepts eminently profitable for those who, having held firm to the belief in the unity of God (ii. 19), were disposed, even after the acceptance of the teaching of the gospel, to think that an intellectual assent to what was set forth was enough, without any effort to build up on the groundwork of faith the superstructure of Christ-like virtues.

In the time of Eusebius (325 A.D.) the epistle of St. James was reckoned among the books not fully accepted by the church. He says (*H. E.*, iii. 25) "among the controverted books, which are yet well known and recognized by most in the epistle circulated under the name of James." But among the apostolic fathers we have quotations from it in the writings of Clement of Rome (1 *Ep. ad Cor.*, cc. 10, 12) and perhaps of Hermas (*Pastor*, mand. xii. 5). Further, in the Syriac version of Melito's apology there are some passages which bear a striking resemblance to the words of St. James, and may have been quotations, (see Cureton's *Spicil. Syr.*, pp. 42, 48); and the Peshito Syriac version contains the epistle. Origen in his commentary on John (*Works*, xix. 6) speaks of the epistle as in "circulation under the name of James," and he quotes from it in another place (*Works*, xii. 129) as that of James, without any comment. Dionysius of Alexandria, who was at the head of the catechetical school there (245), quotes from the epistle. These are all the notices of the epistle on which dependence can be placed before the council of Laodicea (363), when it was included among the canonical books. But there seems no doubt that the words "well known and recognized by most," used by Eusebius indicate that the epistle was by him regarded as a part of Scripture, for in other portions of his works he alludes to it as if he so esteemed it, and evidence of its recognition in the Syrian church speaks strongly in favor of its authenticity. For that church was most likely to have the best knowledge concerning the origin and early circulation of the epistle. We can account for the slight extent to which it was known from the fact that it was addressed, by a bishop who never moved from his home, to one section only of the Christian church, and was not likely to gain such wide acceptance at first as the epistles of St. Paul, whose missionary labors made his name and his writings well known in different countries. Moreover, the tone of the epistle is practical and not doctrinal, and for this reason also it would be less likely to be noticed in the writings of the Christian fathers. Indeed, this feature of the epistle led Luther, who thought there was in it some contradiction to St. Paul's teaching on the doctrine of justification by faith, to call it *eine rechte stroherne Epistel* (ed. of German N. T., 1522), "a veritable epistle of straw." But language like this is due to the distorted way in which the great Reformer looked at the subject. His day called for prominence to be given to the Pauline view of justification. St. James's day had different needs. The character of those for whom this epistle was intended and their special dangers are sufficient to account for the way in which St. James emphasizes what St. Paul would as stoutly have maintained in a like case, that "faith without works is dead."

The view given above, which dates the epistle before the rise of the Pauline controversey, has been ably maintained by many recent theologians, especially in Germany, in opposition to the Tübingen school. See Schueckenburger's *Annotatio*, 1832; Huther's *Commentar*, 1858, 3d ed. 1870; Neander, *Pflanzung*, 4th ed. 1847, p. 564, *seq.;* Ritschl, *Altkath, Kirche*, 2d ed., 1857, p. 109, *seq.*, and *Rechtf. und Versöhn.*, 1874, ii., 277, *seq.;* Weiss, *Bib. Theol. des N. T.*, 1st ed. 1868, 2d ed. 1873; Beyschlag in *Stud. und Krit.*, 1874, i.; Hofmann, *Heilige Schrift*, vii. 3, 1876. Other scholars, while defending the genuineness of the epistle, recognize in it distinct allusions to the Pauline theology, and so prefer a later date. So, for example, Ewald (*Geschichte*, vi. 591, *seq.; Sendsch. an d. Heb. u. Jakobos Rundsch.*, 1870), who takes the epistle as directed against mistaken inferences from Paul's teaching. The Tübingen school, on the other hand, regards the epistle as directly anti-Pauline, and at the same time denies that it is genuine. So Baur, *Paulus*, 2d ed. 1867, Anh. 2; Schwegler, *Nachap, Zeital.*, 1846, i. 413, *seq.;* Hilgenfeld, *Einl.*, 1875, and in *Z. f. w. T.*, 1877, p. 87, *seq.;* Blom. *De Brief van Jacobus*, Dort, 1869, and in *Theol. Tijdsch.*, 1872, p, 241, *seq.* See also Holtzmann in Schenkel's *Bibellex*, s. v. "Jakobosbrief." The argument turns mainly on the interpretation of the doctrine of faith and works in chap. ii. 24, which formally at least is in direct opposition to Rom. iii. 28. In other words, Luther's difficulty is still the chief turning-point of the argument. Now it is certain that the antithesis between Paul and James is not really so sharp as it appears in the verses just cited, because the two do not attach the same meaning to the word "faith." In fact, James's faith without works is not Paul's justifying faith, but the useless faith without love spoken of in 1 Cor. xiii. We have to deal with two types of doctrine using the same terms in different senses, so that it is not inconceivable that the two may really be capable of such reconciliation in the practical Christian life as to make their divergences unimportant. But, say Baur and his school, there is no proof and great internal improbabilty that any type of doctrine existed before Paul, maintaining justification by faith alone, precisely in Pauline terms, and using the very illustrations of Abraham and Rahab which occur in the Pauline theology, and the kindred epistle to the Hebrews. Starting with this difficulty, and indicating in detail the proofs of the author's familiarity with the peculiar terminology of the great Pauline epistles, the Tübingen school urge also that James ii. 5, i. 12, presuppose acquaintance with Rev. ii. 9, 10, and even that the allusion to Rahab (ii. 25) proves the author to have read Heb. xi. 31. Further, it is contended that the supposed marks of an early date, in the condition of the churches addressed, are capable of another interpretation, and that the persecution alluded to may be best understood of the time of Domitian. Finally, the language of the epistle is regarded as a proof that the date is not very early, and the author different from the thoroughly Hebrew figure of James as described by Hegesippus. The weight of these arguments is plainly very unequal, and the ultimate solution of the controversy must mainly be in the region of Biblical theology, where one side has often been tempted to minimize the difference between James and Paul, while the other has not done justice to the positive value of the teaching of our epistle, often speaking of it as a mere ineffective polemic against Paul by one who did not understand him. Compare further Alford, *Gk. Test.;* Wordsworth, *Gk. Test.;* Bishop Lightfoot's *Essay on the Brethren of the Lord;* Davidson's *Introduction to the N. Test.;* Plumptre, *St. James;* Semler, *Paraphrasis Ep. Jacobi*, 1781; Monod, *Introduction à l'ép. de S. Jacques*, 1846; Wiesinger, "Der Brief des Jakobus," in Olshausen's *Bibelwerk*, 1854; Boon, *De Jacobi epistolæ cum Siracidæ libro convenientia*, 1860; Reuss, *L'Épître de Jacques*, 1878. (J. R. L.)

JAMES I. (1394–1437), king of Scotland, third son of Robert III. and of Annabella Drummond of Stobhall, was born at Dunfermline in 1394. A second son, John, did not survive infancy. David, duke of Rothesay, the eldest son, had died under suspicious circumstances while committed to the care of the king's brother the duke of Albany, to whom had also been delegated the virtual government of the kingdom; and the king, in order to secure the safety of the surviving son, resolved in 1405 to place him under the protection of the king of France. The prince, however, on his way thither fell into the hands of the English, and Henry IV. determined not to admit him to ransom. On the death of his father, April 13, 1406, James became nominal sovereign, but, as he was still retained in captivity in England, the duke of Albany continued regent, and was succeeded, on his death in 1419, by his son Murdoch. At first James was confined in the Tower of London, but in 1407 he was removed to the castle of Nottingham, where he enjoyed as much liberty as was compatible with detention, and was treated in all respects by his governor, Sir John Pelham, as a member of the household. The physical and intellectual training begun at St. Andrews under Bishop Wardlaw was completed by the most accomplished tutors, so that he not only attained to high proficiency in all kinds of manly sports, but reached perhaps a more varied and thorough culture than any of his contemporaries. His figure was not much if at all above the middle height, and, though thickset, was finely proportioned. His agility was no less remarkable than his strength; he not only excelled in throwing the hammer and putting the stone, but in all kinds of athletic feats demanding suppleness of limb and quickness of eye. As regards his intellectual attainments, he is reputed to have been well acquainted with philosophy, and it is evident from his subsequent procedure as a sovereign that he had made a special study of jurisprudence; while, besides being a proficient in instrumental and vocal music, he cultivated the art of poetry with a success not surpassed by any previous English writers with the exception of his models Gower and Chaucer. Henry V., on succeeding his father in 1413, removed James to close confinement in the tower, but shortly afterwards took him to Windsor, and in 1417, with the view of detaching the Scotch auxiliaries from the French standard, invited him to accompany him in his expedition against France. From this time, and especially after the death of the duke of Albany in 1419, James was treated with much consideration; and, having given a pledge of his friendly intentions towards England by his marriage with Lady Jane Beaufort, February 2, 1424, he finally obtained his release in the end of March of the same year, the Scottish nation agreeing to pay a ransom of £40,000, in name of expenses for his maintenance while in captivity.

With the reign of James I., whose coronation took place at Scone on the 21st May, may almost be said to begin the substitution in Scotland of constitutional sovereignty, regulated by definite principles and laws and modified by a regard to the opinions and interests of the subjects, for the indefinite authority of the king and the arbitrary rule of the nobles. It is true that after his death the lawless contests of the nobles broke out as fiercely as ever, but by his energetic repression of their violence during his lifetime, and more especially by the virtual creation of statute law modelled on that of England, and the additional importance assigned to parliament, the leaven was partly prepared which was to work towards the destruction of their unlicensed influence. During a session of the parliament held at Perth on the 12th March, 1425, James suddenly arrested a large number of the nobles, including the duke of Albany and his two sons, whom along with the earl of Lennox he caused to be executed. With similar strategy he at a parliament held at Inverness in 1427 arrested Donald of the Isles and fifty of his chiefs. Donald, however, on making all due submission, received his liberty; but when, in violation of his oath he made an abortive attempt to assert his independence, the king, on his making unconditional surrender, confined him to Tantallon castle. As was natural, the energetic rule of the king, and especially his stringent coercion of the nobles, aroused a secret purpose of revenge; and, acting on the inspiration of the earl of Athole, uncle of the king, Sir Robert Graham and other accomplices, with a band of three hundred Highlanders, suddenly, on the evening of the 20th or morning of the 21st February, 1437, entered the apartment of the king in the priory of the Dominicans at Perth, and stabbed him to death with their daggers.

Although the constitutional reforms introduced by James I., and the general tenor of his reign, showed that in him were united in a rare degree decision in action with far-sighted sagacity, his merits as a statesman have been cast in the shade by his achievements in literature. It is also worthy of mention that it was owing chiefly to his representations when in captivity that the pope was induced to grant a bull for the erection of a university at St. Andrews. The *Poetical Remains* of James I. were first published in 1783, edited by William Tytler. The principal poems of which he is the reputed author are *The King's Quair*, *Christis Kirk on the Grene*, and *Peblis to the Play*, and he also wrote several minor pieces. A manuscript of the *King's Quair* formerly belonging to Selden is preserved in the Bodleian library at Oxford. The poem, which is divided into seven cantos, and is written in the seven-lined stanzas of Chaucer, was composed during his captivity in England, to celebrate his love for the lady whom he afterwards married. It is allegorical in form and somewhat tedious in its minute description of details, but always preserves a smooth and harmonious versification, while it contains many finely imaginative passages inspired by true and tender feeling, and characterized by a charming simplicity and grace akin to those of his master Chaucer. One reason why many have doubted that James could be the author of *Christis Kirk on the Grene* is its entire dissimilarity in manner and style to the *King's Quair*. Pope's line, "A Scot will fight for Christ's Kirk o' the Green" is sarcastic, but undoubtedly chronicles a fact. The poem is a humorous delineation of a phase of Scotch rustic life, and its spirit and graphic vigor are not unworthy of Burns, who indeed has received from it more than one suggestive hint, and in *The Holy Fair* and *The Ordination* has imitated its refrain. The oldest evidence for assigning it to James I. is that of the Bannatyne MS. collection made by George Bannatyne in 1568; and, if this evidence is not conclusive for James I., it is so against James V., the only other probable author. There is no printed edition earlier than 1663. Since then several separate editions have appeared, and it has also been printed along with *The Gaberlunzie Man* as the work of James V. That James I. was the author of the poem receives a certain amount of corroboration from its resemblance in subject and style to *Peblis to the Play*, the first words of which are quoted by John Major in describing a ballad which he attributes to James.

The contemporary authorities on the reign of James I. are principally Wyntoun's *Cronykil*, and Bower's continuation of Fordun's *Scotochronicon*. To the succeeding century belong the histories of John Major, Hector Boece, and Bishop Lesley. The modern histories of Pinkerton, Tytler, and Burton are of course well known. In regard to questions connected with his character as an author, see Sibbald's *Chronicles of Scottish Poetry;* Walpole's *Royal and Noble Authors;* Chalmers's *Historic Remains of Scottish Kings;* Tytler's *Scottish Worthies;* Pinkerton's *Ancient Scottish Poems;* Ritson's *Historical Essay on Scottish Song;* Washington Irving's *Sketch Book;* Prescott's *Miscellanies;* and David Irving's *History of Scottish Poetry*. An account of the murder of James I., professedly translated from the Latin of John Shirley in 1440, has been published in an Appendix to Pinkerton's History; in vol. ii. of *Miscellanea Scotica*, Glasgow, 1818; and in Galt's novel, *The Spaewife*.

JAMES II. (1430–1460), twin son of James I., was born in 1430, and, Alexander his elder brother having died in infancy, was shortly after the assassination of his father crowned king at Holyrood. During his minority the house of Douglas used every endeavor to extend their influence,—William, who succeeded to the earldom in 1443, ultimately making no pretension to conceal his claims to independent sovereignty, and at the festivities in 1449, in honor of the king's marriage to Mary of Gueldres, with ostentatious bravado bringing in his train as many as 5000 followers. Shortly after the king attained his majority he in 1452 invited Douglas to become his guest in Stirling castle, and, on his refusing to break the "bands" he had made with the other nobles, in sudden passion stabbed him with a dagger, after which Sir Patrick Grey completed the assassination with a poleaxe. It was not till 1454 that the struggle following this act of violence, which involved all Scotland in a series of intermittent contests, was brought to a close by the flight of the Douglas and the forfeiture of his estates to the crown. His own kingdom being freed from distraction, James resolved to take advantage of the protracted intestine conflict in England, known as the Wars of the Roses, to wrest from the English the possessions they held in the south of Scotland; but while conducting the siege of Roxburgh castle he was killed by the bursting of a cannon, 3d August, 1460.

JAMES III. (1452–1488), king of Scotland, son of James II., was born 1st June, 1452, and shortly after the death of his father was crowned king at Kelso. The custody of the young prince was entrusted to Bishop Kennedy of St. Andrews, but in 1466 he was seized at Linlithgow by Lord Boyd, who in this way succeeded in obtaining the governorship of the royal fortresses, and also won the apparent friendship of the king. James, was, however, as fickle and faithless as he was weak and pliant, and while Lord Boyd's eldest son, who had been created earl of Arran, and had married the king's sister, was absent in the summer of 1469 on an embassy to bring home the king's bride, Margaret of Denmark, the enemies of the Boyds set agencies in motion for having them tried for their seizure of the king. The earl of Arran, obtaining news of their machinations before landing, returned to Denmark; Lord Boyd fled to England; but Sir Alexander, brother of Lord Boyd, suffered execution, and the estates of the family were forfeited. James, whether the fault was his own or not, was sadly unfortunate in his connection with his near relations. While his brother-in-law was a fugitive from his vengeance, his two brothers were also, whether justly or not, the objects of his animosity and dread. The earl of Mar, the younger brother, died at Craigmillar castle in circumstances so suspicious that he was generally believed to have been murdered; and the duke of Albany the elder, making his escape from Edinburgh castle to France, afterwards in 1482 came to an agreement with Edward IV. to hold the kingdom as his vassal. The rivalry of Albany was the more formidable because James by the preference which he showed for artists and musicians and by his retired and reserved manners had alienated the majority of the nobility. While James in the summer of this year was leading an army against England, the nobles, headed by Douglas, suddenly at Lauder seized Cochrane and several of the king's other favorites, and, having hanged them before his eyes, returned with their royal captive to Edinburgh castle. On this Albany suddenly made his appearance, and, having demanded and received the king's liberty, assumed with apparently no objection on the part of James the sovereignty of the kingdom, until an accusation for treasonable connections with England compelled him to flee thither. For some years after this Scotland enjoyed both outward and inward tranquillity, but the jealousy of the nobles against the king's favorites induced them in 1488, along with the young prince, afterwards James IV., to raise the standard of rebellion. The two armies met at the stream of Sauchieburn, near Stirling, but hardly had they come to blows when the king fled in panic from the field. In his flight he was thrown from his horse, and being received into the cottage of a miller near Bannockburn, was there (June 11) stabbed to death by a person unknown, undoubtedly a straggler from the hostile army.

JAMES IV. (1472–1513), king of Scotland, son of James III., was born March 17, 1472, and on the death of his father in 1488 was crowned king at Scone, probably on June 26th. As he not only adopted an entirely opposite policy with the nobles from his father, but also showed great affability towards the lower classes of his subjects, among whom he delighted to wander incognito, few kings of Scotland won such general popularity or passed a reign so untroubled by intestine broils. His libertinism was overlooked on account of his open and friendly bearing, and was to some extent atoned for by his hardiness and courage and his just and temperate rule. So slight were the attempts at insurrection on his accession to the throne that they scarcely required repression; and, although in 1491 Lord Bothwell and others entered into an agreement with Henry VII. to seize his person, the circumstances were always such as either not to require or not to favor the carrying out of the project. Indeed, Henry seems throughout to have greatly preferred the friendship of the Scotch monarch either to his active hostility or his enforced submission; and accordingly, although James had welcomed "Perkin Warbeck," the pretender to the English throne, and made a futile invasion of England in support of his claims, Henry after Warbeck left Scotland in 1497 was willing to forget all old causes of enmity. In September of that year a truce of seven years was negotiated between the two monarchs, and in August, 1503, the alliance was confirmed by the marriage of James with the princess Margaret, of England—a union which led eventually in default of the Tudors to the accession of the Stuart dynasty to the English throne. Of the peace with England James took advantage to establish order in the Highlands, where he introduced a more complete legal jurisdiction. After the accession of Henry VIII. it became apparent that the friendly relations with England were no longer possible; and, James, having several private grounds of quarrel, was induced by the king of France to venture in 1513 on an invasion of England. His methods of warfare seem, however, to have been formed chiefly according to notions borrowed from the knightly tourneys, the organization of which had made him famous throughout Europe; and on the threshold of his enterprise he was slain on the 9th September, at Flodden Field, his death and the disastrous rout of his army being due to his rash and quixotic bravery.

JAMES V. (1512–1542), king of Scotland, son of James IV., was born at Linlithgow, 10th April, 1512, and crowned king at Scone, in October, 1513. At first the regency was vested in his mother, but after her marriage with the earl of Angus in 1514 the office was transferred by the estates to the duke of Albany. The English forbore to follow up their victory at Flodden, but the close connection of Albany with France now aroused the jealousy of Henry VIII., and Scotland was continually exposed to more or less serious attacks from the English until Albany, to whose arrogant bearing and French manners and habits not even the enmity against him of Henry could reconcile the estates, finally in 1524 took his departure to the country of his choice. Upon this James, through the scheming of Henry, was "erected" king in the Tolbooth of Edinburgh, ruling the kingdom by the advice of his mother and the lords in council. In 1526 James was persuaded to choose as his governor the earl of Angus, who kept him in close confinement until May, 1528, when he made his escape from Falkland, and put such vigorous measures in execution against Angus as compelled him to flee to England. In 1532 Angus, taking advantage of the discontent in the south of Scotland caused by the king's conduct towards the Armstrongs, and of the distracted condition of the Highlands, aided an English raid on the borders; but shortly afterwards negotiations for peace were begun, and a treaty was finally signed in 1534. In January, 1537, James was married to Madeleine of France, but, she dying in July of the same year, he in June, 1538, espoused Mary of Lorraine. Henry VIII. was by no means satisfied with the influence he exercised in Scotch affairs, or the amount of deference he received from his nephew; and, his jealousy receiving special provocation from the interest taken by James in foreign politics, he in 1542 despatched an expedition against Scotland, which failed from want of a commissariat. James determined to make reprisals, but owing to the indecision of the nobles, who had no love of the enterprise, his army was scattered at the rout of Solway Moss on the 25th November. On the 14th December following James died at Falkland. His successor was his daughter Mary, born seven days before his death. Though possessing a weak constitution, which was further impaired by his irregular manner of life, James manifested great vigor and independence as a sovereign, both in withstanding the machinations of his uncle and opposing the influence of the nobles. The persecutions to which the Protestants were exposed during his reign were, however, due to the excessive influence exercised by the ecclesiastics, especially David Beaton, archbishop of St. Andrews. The king's habit of mingling with the peasantry secured him a large amount of popularity, and has led many to ascribe to him the authorship of three poems descriptive of scenes in lower class life—*Christis Kirk on the Grene*, *The Gaberlunzie Man*, and *The Jolly Beggar*. There is no proof that he was the author of any of these poems, but from expressions in the poems of Sir David Lyndsay, who was on terms of special intimacy with him, it would apppear that he occasionally wrote verses.

JAMES I. (1566–1625), king of England. This sovereign, James VI. of Scotland, in whom the crowns of Scotland and England were united, was the son of Mary Queen of Scots and of Henry, Lord Darnley, and was born in the castle of Edinburgh, 19th June, 1566. His mother while in captivity having been forced to abdicate the sovereignty, James was crowned king at Stirling July 29, 1567. The regency was vested in the earl of Murray, who by his masterly political skill and force of character held the various factions in complete restraint until his assassination at Linlithgow in February, 1570. The absence of his authoritative will at once allowed free scope to the various elements of disorder latent in the kingdom, and during the regency of Lennox, who was mortally wounded in a fray at Stirling with the adherents of Mary, September, 1571, and of the earl of Mar his successor, who died in October, 1572, strife and confusion held almost rampant sway. The earl of Morton, the next regent, being possessed, however, of some of the high qualities of his predecessor Murray, succeeded with assistance from Elizabeth of England in quelling the last embers of insurrection, and afterwards held in check the interested ambition of the nobles, until in 1578 they succeeded in discrediting his influence by the scheme of placing the government nominally in the hands of the boy monarch. In June, 1581, Morton suffered death for his connection with the murder of Darnley. James, to whom were thus early entrusted the functions of sovereignty, had spent his infancy under the care of the earl of Mar, on whose death he was taken charge of by the earl's brother, Alexander Erskine. For his principal tutor he had George Buchanan, who inspired him with a genuine interest in learning and a strong ambition to excel in poetical composition; he was also so far influenced by the Reformed type of religion as to have imbibed a love for theological argument, although he always cherished a strong distaste towards both Calvinistic doctrine and the Presbyterian form of government. His character was indeed formed amidst moral and intellectual surroundings strangely mingled and inharmonious, in addition to which the nature he inherited was rather a medley of isolated capacities than a definite and distinct idiosyncrasy. From the first compelled to adopt an attitude hostile to his mother, and, at the same time that he could not but resent her imprisonment by Elizabeth, unable to trust in her intentions towards himself, he seems to have regarded her death both as a relief and as a calamity and disgrace. As he knew that each party in the state, the Catholics, the nobles, the Presbyterians, wished to make him their tool, he resolved to act towards them as suited his convenience; but, although he possessed a certain sharp shrewdness and foresight as well as no small knowledge of character, his inability to take a comprehensive view of affairs, or to form a truly courageous resolution, made his policy often rash and reckless in regard to matters seemingly small, and always shifting and irresolute in regard to affairs of the highest moment. The moral courage he possessed was not inconsistent with physical cowardice; indeed, the chief element in it was an overweening self-conceit, to which the consciousness of superior intellectual attainments gave the consummating touch; and thus it was that the very difficulties of his position gradually nourished within him the conviction of the divine right inherent in his office, and caused all his conduct, wavering and uncertain as it was, to be inspired by the one purpose of building up his kingly prerogative.

Taking advantage of the weakness of the royal authority during the king's minority, the General Assembly of the Scottish Church resolved in 1581 to substitute Presbyterianism for Episcopacy, and James, being shortly afterwards seized by the nobles at the raid of Ruthven, was unable to put his veto on their procedure, until after the overthrow of those implicated in the conspiracy, when in 1584 the estates passed an act denouncing their assumption of legislative power. In 1585 James was, however, besieged in Stirling by the exiled lords, and compelled to pardon them and dismiss his favorite, Arran. As their influence was moreover backed by Elizabeth, and as the hopes of James were even thus early directed towards succeeding her on the English throne, he discovered it to be advantageous to disguise his sentiments towards the Presbyterians. The destruction in 1588 that overtook the Armada of the Catholic Philip of Spain deprived James of all anxiety regarding the effects of his mother's testamentary disposal of her crown to that monarch, but it naturally inclined him for a time to a more close alliance with the Protestants, the result of which was seen, not only in his marriage in 1589 to the Protestant princess Anne of Denmark, but in an Act of the estates in 1592, which sanctioned the formal abolition of Episcopacy. In 1594 he also found it necessary to reduce the Catholic lords of the north of Scotland, but in 1597 he deemed it prudent to balance the influence of the Presbyterians, and also to flatter the hopes of the Catholics of England by securing the revocation of the forfeiture of the estates of the banished nobles, and permitting them to return. Previous to this his action against the preacher of a sermon in which Elizabeth was attacked as an atheist led to a "No Popery" riot in Edinburgh. The breach between him and the Presbyterians was still further widened by the statute of 1599, appointing a certain number of ministers to a seat in parliament with the title of bishop, and by his publication in the same year of his *Basilicon Doron*, in which he promulgated his views in regard to the divine rights of kings. With the exception, however, of his peculiar experiences in connection with the mysterious Gowrie conspiracy at Perth (August 5, 1600), the remainder of his reign in Scotland until his succession to the English throne in 1603 was quiet and uneventful; and the only fact of notable importance connected with his subsequent government of that kingdom is his suspension of the meetings of the General Assembly, until by the banishment and imprisonment of Melville and its principal leaders he was able in 1610 to convene an Assembly which agreed to the organization of a modified Episcopacy. The peculiar union of talents and defects which constituted the character of James made him perhaps the most unfit successor of Elizabeth that could have been chosen. His strutting pomposity was rendered strangely ludicrous by a personal appearance the several defects of which were heightened by their contrast with each other, and it was also constantly interfered with by his want of a proper sense of decorum. If he displayed great cleverness in avoiding immediate political difficulties and in gaining for the moment his own ends, he was incapable of adapting himself mentally to his new position as sovereign of England, and his fussy self-importance made it almost inevitable that he should mortally offend the political temperament then in England so peculiarly sensitive. Indeed, the traditional policy which the circumstances of Scotland had rendered almost a second nature to the Stuarts was repugnant to the susceptibilities of England, and utterly alien to her political constitution, and in the case of James all the worst defects of this policy were exaggerated. Thus his seeming shrewdness in small matters, and his witty and terse political axioms, only secured him the reputation of being the "wisest fool in Christendom;" and, while his absurd personality cast ridicule on his kingly pretensions, the general character of his political procedure estranged from him every party in the state, and called into action influences which in the subsequent reign wrought the overthow of the monarchy whose prestige he had almost hopelessly tarnished. Having narrowly escaped a plot of the Catholics to seize his person shortly after his arrival in London, James resolved to flatter their hopes by granting them toleration, but his proclamation in February, 1604, against the Jesuits revealed the hollowness of his professions and led to the futile gunpowder conspiracy of November, 1605. Its discovery dissipated for the time the alienation already begun between him and the Commons on account of his imprudent assertion of his prerogative against the Puritans at the Hampton Court conference, and the subsequent disagreements in regard to ecclesiastical reform and a union with Scotland. Against the goodwill of the Commons, which showed itself in the readiness with which a subsidy was granted for his debts, he, however, trespassed almost immediately by abusing the royal custom of placing impositions on merchandise. All attempts at a compromise on the subject having failed, James in February, 1611, dissolved the parliament, and a second parliament which he summoned in 1614 proving equally recalcitrant was also dissolved, the fact that it was not allowed the opportunity of transacting business earning for it from the courtiers the name of the "addled parliament." To help in filling the vacuum in his treasury, James had recourse with small success to the odious practice of demanding benevolences, and, in addition to various other misuses of his prerogative, to the excessive increase of monopolies, and to the virtual sale of peerages and other high offices. The administration of the affairs of the kingdom was at the same time gradually withdrawn from the council, and the whole executive authority entrusted to favorites. As the breach between him and his subjects gradually widened he became more anxious—both in order to supply himself with money, and to obtain the support of an influential external authority—for an alliance with Spain, and in 1617 negotiations were entered into for a marriage between the young prince Charles and the Spanish infanta. But on the part of Spain those proposals were never seriously entertained. Their only result was to impart such irresolution to the policy of James in reference to the Bohemian insurrection as to afford Spain the opportunity of seizing the Palatinate; and by continuing to dangle the possibility of the marriage before the eyes of James the emperor succeeded in delaying his interference till the Palatinate was lost. Still intent on his purpose of the Spanish marriage, to which he had ruthlessly sacrificed the life of Sir Walter Raleigh, James despatched his favorite Buckingham along with Charles to Madrid, and the return of the baffled and disappointed wooer in 1624 dissipated the last lingering sentiment of respect which the English nation may have cherished towards the king. Buckingham and Charles now virtually overrode the royal prerogative, and at their instance not only was war declared against Spain, but on the condition of granting toleration to the Catholics of England, a treaty of marriage between Charles and Henrietta Maria of France was signed at the close of 1624. James died on March 25, 1625.

James inaugurated his literary career in 1584 by the publication of the *Essayes of a Prentice in the Divine Art of Poetry*, and in 1591 he published *Poeticall Exercises at Vacant Houres*. His other compositions in verse include a paraphrase of the Revelation of St. John and a version of the Psalms. As he deemed it necessary to give to the world his opinion on almost every subject of importance which then occupied public attention, his prose disquisitions are legion, but the best known are *Demonologie*, 1597; *Basilicon Doron*, 1599; and *Counterblast to Tobacco*, 1616. A collected edition of his prose writings was published in 1616, edited by the bishop of Winchester. Some of his poetical translations are not without merit, but both his prose and poetry, though displaying occasional wit and cleverness and some faculty of composition, are studded with absurdities, and but for the fact that their author was a monarch would scarcely deserve a reference.

The original authorities for the reign of James I. are the state-papers published in the series of the Master of the Rolls; the *Register of the Privy Council of Scotland* (vol. ii. 1569-78, by Burton, 1878; vol. iii., 1578-85, by Masson, 1880); the *Letters and State-Papers during the reign of James the Sixth*, published by the Abbotsford Club; the *Letters* of the children and other relations of James, published by the Maitland Club, in facsimile form, from the originals in the Advocates' Library, Edinburgh; the letters published under the title of the *Court and Times of James I.*, 1846; his correspondence with Cecil, published by the Camden Society; the correspondence in the *Cabala;* Camden's *Annals;* Goodman's *Court of James I.*, edited by J. S. Brewer, 1839; Calderwood's *History of the Church of Scotland;* Melville's *Diary; Historie and Life of James the Sext*, 1566-96, *with a short continuation to* 1617, published by the Bannatyne Club, Edinburgh, 1825; the secret histories by Osborne, Weldon, Heylin, and Peston, edited by Sir Walter Scott; Arthur Wilson's *Life and Times of James I.*, London, 1653. See also, in addition to the histories of Burton, Tytler, Gardiner, Ranke, and others, Harris's *Historical and Critical Account of the Writings of James I.*, 1573; Irving's *History of Scottish Poetry;* and Disraeli's *Literary and Political Character of James I.*

JAMES II. (1633–1701), king of England, and as king of Scotland James VII., second surviving son of Charles I. and Henrietta Maria, was born at the palace of St. James's, October 15, 1633, and was created duke of York in January, 1643. During the civil war he was taken prisoner by Fairfax at Oxford in 1646, but in 1648 he made his escape to Holland. After the second failure of the Stuart cause he served for some time in the French army under Turenne, but at the command of his brother he in 1656 accepted a military commission from Spain. At the Restoration in 1660 he was appointed lord high admiral and lord warden of the Cinque Ports. For the management of the civil administration of the navy he had the qualification of industry and careful regard to details; and if his victory over the Dutch in 1665 was principally a happy stroke of good luck, and his drawn battle with De Ruyter in 1672 was more to his antagonist's credit than to his, still the fact that his career as an admiral was free from disaster shows that his seamanship must have been at least respectable. Outside, however, the sphere of practical routine, James was blind and insensate, and his whole political conduct—while it indicated that he could stoop to compromise and deception when he deemed these necessary—was marked by a heedlessness and perverse obstinacy possible only to a rigid and contracted understanding preoccupied with a single purpose. He possessed the vices of his race without its virtues and redeeming points, and in him the propensity to despotism developed itself in a form unmitigated by any mildness or amiable weakness of temper, unenlightened by any gift of foresight or practical wisdom, and unadorned by any personal accomplishment. Although at the Restoration his sympathies were so little Catholic that he supported the policy of Clarendon, whose daughter Anne he secretly married in September, 1660, publicly acknowledging the union in the December following, he soon thereafter became a convert to Romanism, and in 1672, in opposition to the expostulations of his brother, openly avowed his change of faith. Anne Hyde having died in 1671, he also persuaded his brother to defy the wishes of both Houses of Parliament by permitting him in 1673 to marry the Catholic princess Mary of Modena. On account of the Test Act, passed in this year, he had been compelled to resign his office of admiral, and, although the marriage in 1677 of his daughter Mary to William, prince of Orange, somewhat allayed the distrust with which he was regarded, it was deemed advisable on the discovery of the Popish plot in 1679 that he should retire for a time to Brussels. Afterwards he was appointed lord high commissioner to Scotland, where his arbitrary bigotry found congenial employment in the persecution of the Covenanters; but in 1684 Charles ventured to dispense in his case with the Test Act, and restored him to his office of admiral.

The influence of the loyal enthusiasm which surrounded the last days of Charles in 1685 was felt in the calm acquiescence with which the nation witnessed James's succession to the throne on February 6, and his coronation on April 23, 1686. The trust awakened by his promise to preserve the Government both in church and state as by law established was indeed almost immediately rudely shaken by his public celebration of mass, by his prohibition of preaching against Catholicism, and by his appointment of Catholic officers to the army; but that the goodwill at least of the Commons was still strong was manifested by the grant of a revenue of two millions, and by the enactment of severer measures against treason. If the loyalty of the nation had began to waver, it was also for the time strengthened by the premature and headstrong attempts at rebellion by Argyle in Scotland, and Monmouth in England. The renewal of the Covenanting persecutions had, however, branded the name of James with the hatred of the Scottish people, and the butchery of the Bloody Assizes, which in England followed the discomfiture of Monmouth, left behind it a widespread horror, the repression of which only wrought effects on the mind of the nation the deeper and more ineffaceable. But James was too intent on his one aim—the establishment of irresponsible depotism—to scrutinize or consider the indirect consequences of his acts. In that aim was necessarily involved the restoration of Popery, because James was a Papist, but happily the accidental prominence given to this secondary and subordinate aim made the other impossible of success. In his imprudent zeal to accomplish his purpose, James outran the wishes even of Rome, but that was because the purpose which to the one was secondary was to the other primary. James required both a large standing army and freedom from the control of parliament; but for these ends a foreign source of money supply was at first necessary, and this he could only obtain by an arrangement which, while it was unpalatable to himself and loathsome to the nation, was far from acceptable to the pope,—namely, by becoming the temporary vassal of Louis of France, whose ambitious designs, notwithstanding his intense and virulent Catholicism, had awakened the jealousy of Rome. Besides, many of the individual acts of James were prompted by the Jesuits, with whom the pope was then at feud. The progress of James's ill-starred design was marked by clear and well-defined steps. While all England was shocked by the cruelties following the revocation by Louis of the edict of Nantes, James resolved to demand the repeal of the Test Act, and when this was refused by parliament he fabricated by means of corrupted judges a semblance of legal sanction for his disregard of its provisions, and not only encamped an army on Hounslow Heath, chiefly officered by Catholics, but manifested his determination that henceforth to be a Catholic should be a recommendation and not a bar to the highest offices of state, by creating Father Petre and five Catholic peers privy councillors. An appearance of liberality was indeed given to his policy by a declaration of indulgence to Protestant dissenters, but this only quickened suspicion as to his ultimate purpose. Moreover, while a commission was illegally appointed to restrain the discussion of political subjects by the clergy, the publication of Romanist sentiments was freely permitted, monasteries and Catholic schools were being rapidly augmented, and an attempt was made to swamp the Protestantism of the universities by conferring the principal dignities as they became vacant on Catholics. This final step, and a second declaration of indulgence of April, 1688, which contained a provision for the prosecution of those clergymen who might refuse to read the declaration in their pulpits, dissipated the last atoms of veneration in the minds of the Tories for the divine right of the king; and after the birth of a son to James in May of the same year nearly every party in the state was prepared to support the invitation to William of Orange to aid in the restitution of the liberties of the country. The discussion of the motives which induced William to accept this invitation, and the results which followed his landing in England, belong properly to the article on WILLIAM III. James, finding the bulwarks of despotism crumbling around him, after refusing the advice of a council of lay and temporal peers to open negotiations with William, made a pretence of yielding only to gain time to escape, and by his cowardly flight, which he persevered in even after being intercepted and brought back to London, rendered the coronation of Mary and William indispensable. All hope in England was for the time lost, and as by his action on the Test Act he had alienated the sycophantic estates of Scotland, the rising in the Highlands afforded no permanent benefit to his cause; but in Ireland it might be possible for him still to enjoy, though in diminished lustre, the glories of sovereignty until he should be restored to his wider dignities. If his policy towards Ireland had been dictated by the position in which he was now placed, it failed of its purpose, for even before the arrival of William he discovered that he had to fight his way to dominion, and finally, notwithstanding the aid of French troops, his craven irresolution in the face of danger lost him the battle of the Boyne, July 1, 1690, after which he made a hurried escape to France. An expedition to England in his favor was projected by Louis in 1692, but was frustrated by the defeat of the French fleet off Cape La Hogue on May 17, and another invasion planned to follow on the success of an assassination plot on February 10, 1696, was foiled by the discovery of the treachery. James died at St. Germain, September, 1701.

The principal contemporary authorities for the reign of James are the *Diaries* of Evelyn, Pepys, and Luttrell; Burnet's *History of His Own Times;* Sir William Temple's *Memoirs; Life of James II.*, London, 1705; Bishop Kennet's *History of England; The Ellis Correspondence*, London, 1829. and the *Life of James II., collected out of Memoirs written by his own hand*, by J. C. Clarke, 1816. See also the *Life* by C. J. Fox; C. T. Wilson, *James II. and the Duke of Berwick*, 1876; and the histories of Macaulay, Lingard, and Ranke.

JAMES, or, in full, JAMES FREDERICK EDWARD STUART (1688–1766), prince of Wales, called by his adherents James III. of England, but better known as the Pretender, was the son of James II. and Mary of Modena, and was born in St. James's Palace, London, June 10, 1688. The general opinion prevailing at the time of his birth that he was a supposititious child seemed to be confirmed by a variety of circumstances, but it has been completely overthrown by undoubted facts. Shortly before the flight of the king to Sheerness, the infant prince along with his mother was sent to France, and afterwards he continued to reside with his father at the court of St. Germain. On the death of his father he was immediately proclaimed king by Louis XIV. of France, but a fantastic attempt to perform a similar ceremony in London so roused the anger of the populace that the mock pursuivants barely escaped with their lives. A bill of attainder against him received the royal assent a few days before the death of William III. in 1702, and the Princess Anne, half-sister of the Pretender, succeeded William on the throne. An influential party still, however, continued to adhere to the Jacobite cause; and an expedition planned in favor of James failed of success chiefly in all probability because his falling ill of measles, on the eve of its departure, enabled the English to assemble so powerful a fleet as rendered disembarkation inadvisable. A rebellion in the Highlands of Scotland was inaugurated in September, 1715, by the raising of the standard "on the braes of Mar," and the solemn proclamation of James Stuart, "the Chevalier of St. George," in the midst of the assembled clans, but its progress was arrested in November by the indecisive battle of Sheriffmuir, and it was practically extinguished a few weeks afterwards by the surrender at Preston. Unaware of the gloomy nature of his prospects, the Chevalier landed in December at Peterhead, and advanced as far south as Scone, accompanied by a small force under the earl of Mar; but, on learning of the approach of the duke of Argyle, he retreated to Montrose, where the Highlanders dispersed to the mountains, and he embarked again for France. A Spanish expedition sent out in his behalf in 1718 under the direction of Alberoni was scattered by a tempest, only two frigates reaching the appointed rendezvous in the island of Lewis. In 1719 James was married at Avignon to the Princess Clementina of Poland, by whom he had two sons, Charles Edward, and Henry, afterwards Cardinal York. His licentious habits soon led to a separation from his wife, and his indolence and irresolution having completely unfitted him for the *rôle* of aspirant to the English throne, the hopes and affections of his adherents were gradually transferred to his son Charles Edward, of whose career an account is given in vol. v., p. 369–70. James spent the remainder of his years at Rome, where he was regarded with very little esteem both by the pope and the populace. The papal soldiers mounted guard at the Palazzo Muti, where he resided, and the pope issued an order that he should be styled king of England, but the Italians were in the habit of naming him the king *here* in contradistinction to the king *there*, that is, in England. Latterly his regular income was 12,000 scudi from the pope, which only was supplemented by the donations, probably not very large, of the adherents of the cause in England. Horace Walpole, writing in 1752, thus describes him, "He is tall, meagre, and melancholy of aspect. Enthusiasm and disappointment have stamped a solemnity on his person which rather awakens pity than respect. He seems the phantom which good nature divested of reflection conjures up when we think of the misfortunes without the demerits of Charles the First. Without the particular features of any Stuart, the Chevalier has the strong lines and fatality of air peculiar to them all." For several of the last years of his life the Chevalier was so infirm in health that he was unable to leave his bed-chamber. He died at Rome, January 12, 1766, and was interred in the church of St. Peter's.

The Jacobite cause in Scotland has given rise to some of the finest specimens of national ballad literature. Two volumes of *Jacobite Relics* were published in 1819–1821, but the collection is very miscellaneous. An edition of Jacobite songs appeared at Glasgow in 1829, and a more complete collection was published in 1861, edited by Charles Mackay. See *History of the Jacobite Club*, London, 1712; *Secret Memoirs of Bar-le-duc*, 1716; Macpherson's *Original Papers; The Decline of the Last Stuarts*, printed for the Roxburghe Club, 1843; Chambers's *History of the Rebellion*, 1824; Jesse, *The Pretenders and their Adherents*, 1858; Thackeray, *Henry Esmond;* Debrosse, *L'Italie il y a Cent Ans*, 1836; Lacroix de Marlès, *Histoire du Chevalier de Saint-Georges et du Prince Charles Edouard*, 1868 and 1876; Doran, *Man and Manners* *at the Court of Florence*, 1875; Id., *London in the Jacobite Times*, 1877.

JAMES, George Payne Rainsford (1801–1860), English novelist, was born in George Street, Hanover Square, London, in 1801, and was educated at Greenwich and afterward in France. He began to write early, and had, according to his own account, composed the stories afterwards published as *A String of Pearls* before he was seventeen. Contributing plentifully to newspapers and magazines, he came under the notice of Washington Irving, who is said to have encouraged him to produce (in 1822) his *Life of Edward the Black Prince*. His next attempt was *Richelieu*, which was finished in 1825, and was well thought of by Sir Walter Scott (who apparently saw it in manuscript), but was not brought out till 1829. Perhaps Irving and Scott, from their natural amiability and invariable habit of encouraging literary aspirants, were rather dangerous advisers for a writer so well inclined by nature to abundant production as James. But he took up the ball of historical romance writing at a lucky moment. Scott had firmly established the popularity of the style, and James in England, like Dumas in France, reaped the reward of their master's labors as well as of their own. For thirty years the author of *Richelieu* continued to pour out novels of the same kind, though of varying merit. The full list of his works in prose fiction, verse narrative, and history of an easy kind includes between seventy and eighty items, most of them being three-volume novels of the usual length. The best examples of his style are perhaps *Richelieu*, 1829; *Philip Augustus*, 1831; *Henry Masterton* (probably the best of all), 1832; *Mary of Burgundy*, 1833; *Darnley*, 1839; *Corse de Léon*, 1841; *The Smuggler*, 1845. His poetry does not require special mention, nor does his history, though for a short time in the reign of William IV. he held the office of historiographer royal. After writing vigorously in all these styles for about twenty years, James in 1850 went to America with his family. He was appointed consul at Richmond, Virginia, and held that post from 1852 to 1858. In September of the latter year he was appointed to a similar post at Venice, where he died May 9, 1860.

James has been compared to Dumas, and the comparison holds good in respect of kind, though by no means in respect of degree of merit. Both had a certain gift of separating from the picturesque parts of history what could without much difficulty be worked up into picturesque fiction, and both were possessed of a ready pen. Here, however, the likeness ends. Of purely literary talent James had little. His plots are poor, his descriptions weak, his dialogue often below even a fair average, and he was deplorably prone to repeat himself. His "two cavaliers," who in one form or another open most of his books, have passed into a proverb, and Thackeray's good-natured but fatal parody of *Barbazure* is likely to outlast *Richelieu* and *Darnley* by many a year. Nevertheless, though James cannot be allowed any very high rank even among the second class of novelists, the generation that read him, and those chiefly youthful persons who read him now and will read him for some time to come, so long as he is attainable on the bookstalls, are not wholly without excuse. He had a considerable portion of the narrative gift, and, though his very best books fall far below *Les trois Mousquetaires* and *La Reine Margot*, there is a certain even level of interest, such as it is, to be found in all of them. James never resorted to illegitimate methods to attract readers, and deserves such credit as may be due to a purveyor of amusement to the public who never caters for the less creditable tastes of his guests.

JAMES, John Angell (1785–1859), preacher and author, was born at Blandford, Dorsetshire, June 6, 1785. After obtaining at school a knowledge of reading, writing, ciphering, and a little Latin, he was at the age of thirteen bound to a seven years' apprenticeship with a linendraper at Poole, with the view of assisting his father in his business at Blandford; but about the close of his term of apprenticeship he began to form the resolution of becoming a preacher, and in 1802 he went to prosecute his studies at the theological college of Gosport. After remaining there for a year and a half, he happened to pay a visit to Birmingham, where his preaching was so highly esteemed by the congregation of Carr's Lane Independent chapel that they invited him to "exercise his ministry amongst them," and accordingly, after finishing his short theological course, he was settled there in the beginning of September, 1805, and ordained on the 8th of May of the following year. For seven years his success as a preacher was comparatively small, but about 1814 his eloquence almost suddenly acquired for him a popularity which attracted large crowds wherever he officiated in England, and never faded during the long term of his subsequent ministry. At the same time his numerous religious writings, the best known of which are *The Anxious Inquirer* and *An Earnest Ministry*, acquired a wide circulation both in England and in America. He died at Birmingham, October 2, 1859. The degree of D.D. was conferred on James by the college of Princeton, New Jersey, and also by the university of Glasgow.

A collected edition of James's works appeared in 1860–64. See *A Review of the Life and Character of J. Angell James*, by J. Campbell, 1860; *True Greatness, a brief Memoir of J. A. James*, 1860; and *Life and Letters of J. A. James*, edited by R. W. Dale.

JAMESON, Anna (1794–1860), was born in Dublin in 1794. Her father, Mr. Brownell Murphy, who was a miniature and enamel painter of some celebrity, took part in his early days in the political commotions which then agitated Ireland. His removal to England in 1798 confined his attention fortunately to his more peaceful calling, in which he attained considerable skill, but his daughter's mind seems to have been influenced in the highest sense by the circumstances that surrounded her birth; she was distinguished from her tenderest years by that ardor and courage and keenness to supply the needs and redress the injuries of others which marked her career through life.

At sixteen years of age she undertook the office of governess in the family of the marquis of Winchester, and later in that of Mr. Littleton, afterwards Lord Hatherton. Between these two engagements she accompanied a young pupil, one of a party of travellers, to Italy, a tour which gave rise to a narrative of what she saw and did, written in an imaginary character. This, her first literary production, the merits of which she little appreciated, did not make its appearance until after her marriage with Mr. Robert Jameson, a barrister, in 1825, when it was advertised by a friend under the title of a *Lady's Diary*, and ultimately published by Mr. Colburn as *The Diary of an Ennuyée*. Mrs. Jameson's marriage was not a happy one; but, if not more unfortunate than many of her sex in this form of trial, she set the example of a rare discretion under it. Her marriage troubles were made no excuse for appealing against the laws of the land or the usages of society. The *Diary of an Ennuyée* attracted much attention. Italy was no such beaten ground then, nor a traveller with ardent feelings for art and nature so common, as both have become since. The authoress has been blamed for assuming the disguise of an invalid, who dies on her way back; but such a tinge of romance made no difference in the truth of her descriptions, while it procured them more readers.

In 1829 Mr. Jameson was appointed puisne judge in the island of Dominica. It was decided to be impracticable for her to accompany him, and meanwhile Mrs. Jameson visited the Continent again with her father. Traces of this journey appear in *Visits and Sketches at Home and Abroad*. Hitherto the subjects she had treated had been limited to impressions of outer scenes and passing things, or to abridgments of history, as in her good schoolbook *Female Sovereigns.* The first work in which her powers of original thought became embodied were her *Characteristics of Shakespeare's Women*, which appeared in 1832. These analyses of the great poet's heroines are unsurpassed for delicacy of critical insight and fineness of literary touch. They are the result of a penetrating but essentially feminine mind, applied to the study of individuals of its own sex, detecting characteristics and defining differences not perceived by the ordinary critic and entirely overlooked by the general reader.

In 1833 Mrs. Jameson paid her first visit to Germany, the literature and art of which country may be said to have then first roused the curiosity of English minds. Dresden and Tieck and Retsch, Frankfort and Dannecker, Weimar and, if not Goethe, who had died the year before, yet the homage which more than restored him to life, successively occupied her. Nor was she proof to the spell of the modern German art which the late King Louis of Bavaria had evoked in his capital. Those conglomerations of hard lines, cold colors, and pedantic subjects which decorated Munich were new to the world, and Mrs. Jameson's enthusiasm first gave them the reputation which has long since faded away.

It was in 1836 that Mrs. Jameson was summoned by her husband to join him in Canada. She started with many a regret for the life she was leaving, and was not long left in doubt as to the fruitlessness of the step. He failed to meet her, even by a letter, at New York, and she was left to make her way alone at the worst of seasons to Toronto. After six months' experiment she felt it useless to prolong a life far from all ties of family happiness and opportunities of usefulness. Before leaving, she undertook a journey to the depths of the Indian settlements in Canada; she explored Lake Huron, and saw much of emigrant and aboriginal life unknown to travellers, which she afterwards embodied in her *Winter Studies and Summer Rambles.* She returned to England in 1838. It was at this period that Mrs. Jameson first devoted her attention to the subject of art. She began by making careful notes of the chief private collections in and near London which had hitherto received no systematic description. This *Companion to the Private Galleries* was soon followed by the *Handbook to the Public Galleries.* These works were useful compilations, and had a certain circulation; but the authoress laid claim to no powers of real discrimination, and many of her verdicts, in which she only followed those that went before her, have been since superseded by exacter knowledge. These works, however, led on to those by which her literary career has been specially distinguished,—her series of *Sacred and Legendary Art.* The time was ripe for such contributions to the traveller's library. The *Acta Sanctorum* and the *Book of the Golden Legend* had had their readers, but no one had ever pointed out the connection between these tales and the works of Christian art. The painters employed by convent or church had introduced the local or family saints according to contract, and the faithful had retained the tradition of their names; but for the modern Protestant traveller the whole was a *terra incognita.* The way to these studies had been pointed out in the preface to Kugler's *Handbook of Italian Painting* by Sir Charles Eastlake, who had intended pursuing the subject himself. Eventually he made over to Mrs. Jameson the materials and references he had collected. They could not have been placed in better hands. She recognized the extent of the ground before her as a mingled sphere of poetry, history, devotion and art. She directed the taste of her readers with judgment and even enthusiasm; and, with the same penetration that had guided her in her literary tasks, she threw many a light on a master's intentions which had escaped both artists and critics.

Another service Mrs. Jameson rendered to the English public, and that the most valuable of all, has still to be noticed. She began her literary career by analyzing books, she proceeded to analyze works of art, and she ended by analyzing society. It was a natural supplement to a course of varied personal experience and no little struggle that her attention should be directed to the great moral questions of the day, and especially to those affecting the education, occupations, and maintenance of her own sex. Her early essay on *The Relative Social Position of Mothers and Governesses* is a masterpiece. She knew both sides; and in no respect does she more clearly prove the falseness of the position she describes than in the certainty with which she predicts its eventual reform.

To Mrs. Jameson we owe the first popular enunciation of the principle of male and female co-operation in works of mercy and education. Her mind was peculiarly to be trusted with the advocacy of such tenets—it had become as clear and judicious by experience as it was ardent and vigorous by nature. In her later years she took up a succession of subjects all bearing on the same principles of active benevolence, and the best ways of carrying them into practice. Sisters of charity, hospitals, penitentiaries, prisons, and workhouses all claimed her interest—all more or less included under those definitions of "the communion of love and communion of labor" which are inseparably connected with her memory. To the clear and temperate forms in which she brought the results of her convictions before her friends in the shape of private lectures, subsequently printed, may be traced the source whence living reformers and philanthropists took counsel and courage.

Mrs. Jameson died in March, 1860. She left the last of her *Sacred and Legendary Art* series in preparation. It was completed, under the title of *The History of our Lord in Art*, by Lady Eastlake.

(E. E.)

JAMESON, or **Jamesone, George** (*c.* 1587-1644), a Scotch portrait painter, was born, probably in 1587, at Aberdeen, where his father was architect and a member of the guild. After studying painting under Rubens at Antwerp, with Vandyck as a fellow pupil, he returned in 1620 to Aberdeen, where he was married in 1624 and remained at least until 1630, after which he took up his residence in Edinburgh. The department of painting which he chiefly practised was portraiture in oil, but he also painted a few historical subjects and landscapes. His portraits are generally less than life size. According to Walpole they are characterized by "delicacy and softness, with a clear and beautiful coloring;" but, although undoubtedly the instructions of Rubens had left their influence on his style, he has no claim to the title of the Vandyck of Scotland by which he is often known, and perhaps owed even his exceptional fame in Scotland as much to chance as to his own merits. Having been employed by the magistrates of Edinburgh to copy several portraits of the Scottish kings for presentation to Charles I. on his first visit to Scotland in 1633, the king rewarded him with a diamond ring from his own finger. This circumstance appears to have at once established his fame, and he soon found constant though not very remunerative employment in painting the portraits of the nobility and gentry of his native land. He also painted a portrait of Charles, which he declined to sell to the magistrates of Aberdeen for the price they offered. The largest collection of the works of Jameson is said to be that in Taymouth castle, and, besides those in the houses of several of the gentry of Scotland, there are a few in the colleges of Aberdeen. He died at Edinburgh in 1644.

JAMESON, Robert (1774–1854), regius professor of natural history in the university of Edinburgh, was born at Leith, July 11, 1774. After an education at Leith grammar school and Edinburgh university, he became assistant to a surgeon in his native town; but, having studied natural history under Dr. Walker in 1792 and 1793, he felt that his true province lay in that science, for which indeed he had had a predilection from boyhood. The course of his studies during the next few years is to be traced in his scientific papers and books. He went in 1800 to Freiberg to study for nearly two years under the learned Werner, and spent other two in Continental travel. On his return to Edinburgh in 1804, when he succeeded Dr. Walker in the chair of natural history, he became, in lectures, writings, and controversy, perhaps the first great exponent in England of the Wernerian geological system; and it is to his credit that, when he found that theory untenable, he frankly and honestly announced his conversion to the views of Hutton. As a teacher, Professor Jameson was no less remarkable than Werner for his power of imparting his own enthusiasm to his students, and from his classroom there radiated an influence which gave a marked impetus to the study of geology in Britain. It was his energy also that, by means of Government aid, private donation, and personal outlay, amassed the greater part of the splendid collection which now occupies the natural history department of the Edinburgh Museum of Science and Art. In 1808 Jameson founded the Wernerian Natural History Society, and in 1819, along with Sir David Brewster, he originated the *Edinburgh Philosophical Journal*, which after the tenth volume remained under his sole conduct till his death, which took place April 19, 1854. His bust, presented by the Wernerian Society to the museum some years before his death, now stands in the university library hall.

Professor Jameson was the author of *Mineralogy of Arran and the Shetland Islands*, 1798, incorporated with *Mineralogy of the Scottish Isles*, 2 vols. 4to, 1800; *Mineralogical Description of Scotland*, vol. i, pt. 1, "Dumfriesshire," 1804 (this was to have been the first of a series embracing all Scotland); *System of Mineralogy*, 1804; *Characters of Minerals*, 1804; *Elements of Geognosy*, 1809; and *Manual of Minerals and Mountain Rocks*, 1821; besides a number of occasional papers, of which a list will be found in the *Edinburgh New Philosophical Journal* for April, 1854, along with a biographical sketch of the author.

JAMESTOWN, a village in Chautauqua county, New York, is situated on the Chautauqua Outlet at the southern end of Chautauqua Lake, about 55 miles south-southwest of Buffalo. It may be conveniently reached by rail, or by steamer from Mayville at the north end of the lake, and its vicinity is steadily rising into favor as a summer resort. The manufactures include alpaca, woollens, pianos and furniture, sashes and blinds, edge-tools and iron. The population, which in 1870 was 5336, was 7264 in 1880.

JÁMI. Núruddín 'Abdurrahmán ibn Ahmed (1414–1492), called el Jámí from his birthplace Jám in Khorásán, was the last great poet and mystic of Persia. See PERSIA.

JAMIESON, JOHN (1759–1838), author of the *Scottish Dictionary*, was born in Glasgow, where his father was a Dissenting clergyman, March 3, 1759, He was educated at Glasgow university, and subsequently attended classes in Edinburgh. After six years' theological study, Jamieson was licensed to preach in 1779. From 1780 till 1797 he was pastor of the Secession (Antiburgher) congregation of Forfar; and from 1797 till his death on July 12, 1838, he occupied the pulpit of the Antiburgher church in Nicolson Street, Edinburgh.

Jamieson's name stands at the head of a tolerably long list of works in the *Bibliotheca Britannica;* but by far his most important book is the laborious and erudite compilation, best described by its own title-page,—*An Etymological Dictionary of the Scottish Language; illustrating the words in their different significations by examples from Ancient and Modern Writers; shewing their Affinity to those of other Languages, and especially the Northern; explaining many terms which though now obsolete in England were formerly common to both countries; and elucidating National Rites, Customs, and Institutions in their Analogy to those of other nations; to which is prefixed a Dissertation on the Origin of the Scottish Language*. This appeared in 2 vols. 4to, at Edinburgh in 1808, followed in 1825 by a *Supplement*, in 2 vols. 4to, in which he was assisted by scholars in all parts of the country. Both appeared together in later editions; in 1879 the first volume of an edition, in which the *Supplement* is incorporated in the body of the work, was published. Abridgments of the *Dictionary* have been issued in 1818, and in many subsequent years. Among Jamieson's other works may be mentioned *The Use of Sacred History*, 2 vols., 1802; *Hermes Scythicus, or the Radical Affinities of the Greek and Latin Languages to the Gothic*, 1814; and various essays, sermons, and poems. .For his *Vindication of the Doctrine of Scripture and of the Primitive Faith concerning the Deity of Christ*, 1795. a reply to Dr. Priestley, Jamieson received the degree of D. D. from the college of New Jersey.

JAMNIA (*'Ιαμνία* or *'Ιάμνεια*), the Greek form of the Hebrew name Jabneel (Josh. xv. 11) or Jabneh (2 Chron. xxvi. 6), the modern Arabic *Yebna*, a city of Palestine, on the border between Dan and Judah, situated 13 miles south of Jaffa, and 4 miles east of the sea shore. The modern village stands on an isolated sandy hillock, surrounded by gardens, with olives to the north, and sand-dunes to the west. It contains a small Gothic church, now a mosque. The place belonged to the Philistines in Biblical times, was taken by Judas Maccabæus (2 Mac. xii. 8, 9), and is mentioned by Strabo (xvi. 2) as a very populous village. The population was mainly Jewish (Philo, *Leg. ad Caium*, § 30), and the town is principally famous as having been the seat of the Sanhedrin from 70 to 135 A. D. In 1144 a crusading fortress was built on the hill; it is often mentioned under the name Ibelin. There was also a Jabneel in Lower Galilee (Josh. xix. 33), called later Caphar Yama, the present village *Yemma*, 12 English miles south of Tiberias; and another fortress in Upper Gallilee was named Jamnia (Joseph., *Vita*, 37).

JAMRUD, a ruined fort in Pesháwar district, Punjab, India, situated in 34° N. lat. and 71° 24′ E. long., at the mouth of the Khyber Pass, 1670 feet above sea-level. It was occupied by Hari Sinh, Ranjit Sinh's commander, in 1836; but in April, 1837, Dost Muhammad sent a body of Afgháns to attack it. A battle ensued, in which the Síkhs gained a doubtful victory, with the loss of their general, Hari Sinh. During the military operations of 1878–79 Jamrúd became a place of considerable importance as the frontier outpost on British territory towards Afghánistán.

JAMS AND JELLIES are conserves of the pulp and juice of succulent and juicy fruits prepared by boiling with sugar. They differ from each other only in the fact that jam is a thick pulpy opaque preparation, sometimes of the entire fruit—rind, pulp, and kernel—and sometimes of fruits only partly broken, as in the case of black currant jam, while jellies are pure transparent gelatinous preparations of juices alone. The preparation of these preserves was formerly a purely domestic art; but of recent years manufactures of very large dimensions have sprung up for the preservation of many of the commoner fruits, as an example of which the marmalade trade may be cited, marmalade being simply a form of jam. The principal fruits commonly used for jam-making are varieties of plums, apricots, cherries, black currants, gooseberries, strawberries, raspberries, mulberries, cranberries, oranges, and quinces; rhubarb stalks are also employed. Jellies have a wider signification than is comprehended in the above definition, which embraces fruit jellies alone, as many jellies have for their basis isinglass and other gelatin-yielding bodies of animal origin, and starches also form with boiling water a kind of jelly. Fruit jellies owe their property of gelatinizing to the presence or development of a gummy principle in their composition, called pectin. Except in its gelatinizing effect pectin is in no way related to gelatin, being indeed a non-nitrogenous body closely allied to cellulose. Pectin is only found in very ripe fruits, but an allied body, pectose, which is abundant in growing and partially ripened fruits, is easily transformed into pectin by the action of heat, and such a transformation takes place in the boiling of the juices of acid unripe fruits.

In the preparation of jellies it is essential to obtain the juices as free from all pulp and cloudiness as possible, therefore the less the fruits are squeezed the more transparent will be the resulting jelly. To get the juice to flow freely from hard fruits it is necessary in most cases to heat and in some instances to boil them. The quantity of sugar required for the preservation of jams and jellies varies from two-thirds to equal weight of the fruit or juice, and the boiling should be conducted at a gentle heat as short a time as possible after the addition of the sugar, which by long or violent boiling tends to become syrupy, this destroying the gelatinizing property. Jellies are principally prepared from red, white, and black currants, gooseberries, grapes, apples, raspberries, cherries, bilberries, pomegranates, quinces, and various other juicy fruits. Jams and jellies for preservation are poured into earthenware jars; the surface of the preserves is then covered with a disk of paper dipped in brandy, and the jar tightly tied over with membrane or gummed paper, and stored in a cool dry situation. They must be prepared from clean dry fruit, and it is essential that cane and not beet sugar should be used for their preservation. Wet or otherwise damaged fruit, and all fruits preserved with beet sugar, are peculiarly subject to mouldiness, an evil against which some amount of precaution is necessary at all times. The domestic uses of these preparations, and the esteem in which they are held, are known universally. They have a refrigerating and gently laxative influence, and the citrate, malate, or tartrate salts they contain give them a positive value as anti-scorbutics, in addition to the pleasant and refreshing taste and flavor they possess. While these preserves have the same anti-scorbutic efficacy as the respective fresh fruits from which they are prepared, they are free from the tendency to induce choleric disorders which frequently attends the consumption of uncooked fruits, and the sugar with which they are prepared possesses its own proper nutritive value as an article of food.

JAMU, or **Jummoo**, a town in Kashmír state, Punjab, India, headquarters of Jamu province, in 32° 43′ 52″ N. lat. and 74° 54′ 14″ E. long. on the Távi, a tributary of the Chenab, among the mountains of the outer Himálayan range. The town and palace stand upon the right bank of the river; the fort overhangs the left shore at an elevation of 150 feet above the stream. The lofty whitened walls of the palace and citadel present a striking appearance from the surrounding country. An adjacent height commands the fortress, rendering it untenable against modern artillery. Extensive and handsome pleasure grounds and ruins of great size in the suburbs attest the former prosperity of the city when it was the seat of a Rájput dynasty of independent Rájás, whose dominions extended into the plains and included the modern district of Siálkot. It was afterwards conquered by the Síkhs, and formed part of Ranjít Sinh's dominions. For its subsequent acquisition by Ghuláb Sinh, see Kashmir. The population is estimated at about 8000.

JANESVILLE, chief town of Rock county, Wisconsin, U. S., was founded in 1836, and received its city charter in 1853. It contains numerous churches and schools, including the State institute for the blind. Rock River, flowing through the city, supplies water-power for five flour-mills, two woollen factories, and a cotton factory; and the manufactures comprise boots and shoes, carriages and farm machinery, and beer. The population in 1870 was 8789; in 1880, 9018.

JANGIPUR, or **Jahángírpur**, the chief town of the subdivision of the same name, in Murshidábád district, Bengal, situated on the left bank of the Bhágirathí, in 24° 28′ N. lat. and 88° 6′ 45″ E. long. The town is said to have derived its name from having been founded by the Mughal emperor Jahángír. During the early years of British rule it was an important centre of the silk trade, and the site of one of the Company's commercial residences. Jangipur is best known as the toll station for registering all the traffic on the Bhágirathí. The number of boats registered there annually is about 10,000; the amount of toll is £8000, or about one-third of the total gross revenue derived from the Nadiyá rivers. The population in 1872 was 11,361.

JANIN, **Jules Gabriel** (1804–1874), a remarkable instance of a certain kind of critic, was born at St. Étienne, the great manufacturing town of the department of the Loire, on December 24, 1804, and died at his house near Paris in June, 1874. His father was a lawyer, and he was well educated, first at St. Étienne, and then at the famous Collége Louis-le-Grand at Paris. He betook himself to journalism very early, and worked on different papers, the *Figaro*, the *Quotidienne*, etc., until in 1836 he fixed himself as dramatic critic of the *Débats*. Long before this, however, he had made a considerable literary reputation, for which indeed his strange novel *L'Âne Mort et la Femme Guillotinée* (1829) would have sufficed. *La Confession*, which followed, was less remarkable in substance but even more so in style; and *Barnave*, in 1831, sustained the literary reputation of the author, though the violent attacks it contained on the Orleans family did not, when they were taken with his subsequent conduct, increase his reputation for consistency. From the day, however, when Janin became the theatrical critic of the *Débats*, though he continued to write books indefatigably, he was to most Frenchmen a dramatic critic and nothing more. His system was odd enough. He called himself "prince of critics," a self-presented testimonial in which the mixture of irony and vanity (in all senses of the word) which marked all his work may be detected. He was outrageously inconsistent, and judged things from no general point of view whatsoever, though at least latterly his judgment was usually good-natured. But few journalists have ever been masters of a more attractive fashion of saying the first thing that came into their heads, and if he had called himself a prince of journalists he would not have been far wrong. After many years of *feuilleton* writing he collected some of his articles in the work called *Histoire de la Littérature Dramatique*, which, as may be gathered from what has been said, by no means deserves the title. In 1865 he made his first attempt upon the Academy, but was not successful till five years later. Meanwhile he had not been content with his *feuilletons*, written persistently about all manner of things. No one was more in request with the Paris publishers for prefaces, letterpress to illustrated books, and all the other hackwork which usually engages in France men of letters of a somewhat higher class than those who generally devote themselves to it in England. He travelled (picking up in one of his journeys a curious windfall, a country house at Lucca, which fell to him in a lottery), and wrote accounts of his travels; he wrote numerous tales and novels, for the titles of which we have no space here, and composed many other works, of which by far the best is the oddly entitled *Fin d'un Monde et du Neveu de Rameau*, in which, under the guise of a sequel to Diderot's masterpiece, he showed to considerable advantage his great familiarity with the late 18th century. He married in 1841; his wife had money, and he was always in easy circumstances. In the early part of his career he had many quarrels, notably one with Felix Pyat, but latterly, partly owing to his critical authority and partly to his good temper and hospitality, he was a very popular man with his craft, and at his death his library was said to contain the greatest number of gift and dedication copies of contemporary works that had ever been brought to the hammer. Even in the few years since his death, however, his reputation has rapidly faded, and except with those who know how to look at literature in the largest and most tolerant way, it is not likely to revive. His *Âne Mort* is really a most remarkable book. Written half in parody, half in deliberate pursuance of the romantic ideas, it anticipated by fifty years in point of time and far excelled in point of literary value the recent performances of the naturalist school. Those who wish to know what Janin might have been should read this, *Barnave*, and the *Fin d'un Monde.* But for the most part his work is mere improvisation, and has no elements of vitality in it except a light and vivid style.

JANINA, Jannina, Joannina, or, as the name is frequently written according to its actual Albanian pronunciation, Yanina, a town of European Turkey in southern Albania, or—to retain the ancient designation—Epirus. The position of Janina is strikingly picturesque. At the foot of the grey limestone mass of Mount Mitzekeli (1500 ft.), which forms part of the fine range of hills running north from the Gulf of Arta, there lies a valley (the Hellopia of antiquity) partly occupied by a lake; and on the slopes of a slight eminence, stretching down to the western shore, stands this town of St. John. It has greatly declined from the state of barbaric prosperity which it enjoyed in the beginning of this century, when it was the seat of Ali Pasha, estimated to have from 30,000 to 50,000 inhabitants. The fortress—Demir-Kule, or Iron Castle, which like the principal seraglio was built on a promontory jutting down into the lake—is now in ruins. But the town still possesses fourteen mosques, each embosomed by a cluster of trees, and there are also seven churches, two synagogues, a Greek college, a library, and a hospital. As the centre of a vilayet it contains a governor's residence (rebuilt in 1870). Sayades (opposite Corfu) and Arta are the places through which it receives its imports. A considerable activity in trade and industry is maintained by the Greek population, the rich gold and silver embroidery for which the town has long been famous being still one of the notable articles in its bazaar. According to M. Moreau, the French consul (*Bull. de la Soc. de Géogr.*, Paris, 1876), Janina contained 16,230 inhabitants in 1875, of whom 4136 were Mahometans, 8989 Christians, and 3105 Jews. Synvet (*Les Grecs de l'Empire Ottoman*, Constantinople, 1878) reckons the Greeks alone at 14,362 (the island on the lake being included). The vilayet of Janina, previous to the cessions made to Greece in 1881, comprised the sandjaks of Janina, Argyrocastro, Berat (Avlona), Prevesa, and Thessaly, and the sandjak contains the districts of Janina (town and country), Aidwat, Prevena, Cognitza, Metzovo, and Philates. The lake (perhaps to be identified with the Pambotus of antiquity) is 6 miles long, and has an extreme breadth of 3 miles. In time of flood it is united with the smaller lake of Labchistas, which lies to the north. According to Guido Cora's investigations in 1878, the greatest depth does not exceed 32 feet. There are no affluents of any considerable size, and the only outlets are underground passages or katavothra extending for many miles through the calcareous rocks.

The theory supported by Leake (*Northern Greece*) that the citadel of Janina is to be identified with Dodona, is now generally surrendered in favor of the claims of a more southern site. As Anna Comnena, in describing the capture of the town (*τὰ 'Ιοάννινα*) by Bohemond in 1082, speaks of the walls as being dilapidated, it may be supposed that the place existed before the 11th century. It is mentioned from time to time in the Byzantine annals, and on the establishment of the lordship of Epirus by Michael Angelus Comnenus Ducas, it became his capital. During the 14th century it was frequently attacked by the Albanians; but it was still in possession of the successors of Michael when the forces of Sultan Amurath appeared before it in 1430 (*cf.* Hahn, *Alban. Studien*, pp. 319-322). Since 1431 it has continued under Turkish rule. In modern times it became famous as the seat of the tyrant Ali (1788–1822). See Ali Pasha, vol. i. p. 505.

Descriptions of Janina will be found in Holland's *Travels*, 1815; Hughes' *Travels in Greece, etc.*, 1830; Tozer, *The Highlands of Turkey*, 1869. See also Major R. Stewart, "On the Phys. Geogr. of Epirus," in *Journ. Roy. Geogr. Soc.*, 1869.

JANIZARIES, or Janissaries (Turkish, *Yeñi*, new, and *'askari*, soldier). See Army, vol. ii. p. 539.

JANSEN [Jansenius], Cornelius (1585–1638), bishop of Ypres, and the author of the celebrated *Augustinus*, was born, of humble Catholic parentage, at Acquoy or Ackooi, a small village near Leerdam, and 7 miles to the northeast of Gorcum, Holland, on 28th October, 1585. After completing his preliminary studies at Leerdam and Utrecht, he in 1602 proceeded to Louvain, where he studied for a short time at the Jesuit college; but afterwards, becoming dissatisfied with the doctrines there taught on the hotly discussed questions of free will and grace, he transferred himself to the college of Adrian VI., where he came under the influence of a pious and learned teacher, Jacobus Jansonius by name, who is described as having been an ardent disciple of Augustine and a follower of Michael Bajus (see Bajus), whose doctrinal views had been condemned by Pius V. and Gregory XIII. At the same time he formed an acquaintance, which grew into intimate friendship, with the like-minded Vergerius (see Du Vergier de Hauranne), who afterwards became abbé of St. Cyran. Having graduated in philosophy at Louvain in 1604, Jansen went to Paris for the benefit of his health, which had suffered from the ardor with which he had pursued his studies in theology with a view to a doctor's degree. Here he remained for some time, supporting himself by teaching; afterwards he accompanied Vergerius to Bayonne, the native place of the latter, where they spent several years together, Du Vergier ultimately becoming canon of the cathedral, and Jansen head of the episcopal college. Every available moment of their time was devoted to the study of the fathers and especially of Augustine. In 1617 Jansen returned to Louvain, whither he had been urgently summoned by Jansonius, who greatly desired to have there a man of real learning and energy who should be able to counteract the growing influence of the Jesuits. On his arrival he undertook the principal charge of the newly founded college of St. Pulcheria, but this appointment he did not long retain, feeling, it is said, a growing aversion to philosophical pursuits, and desiring to possess the utmost possible leisure that he might devote himself wholly to theology. In 1619 he became doctor in that faculty. The reputation which he even then enjoyed as a theologian is well indicated by the fact that he was formally requested by the papal nuncio to undertake a reply to the recently published *De Republica Ecclesiastica* of Marco Antonio de Dominis, archbishop of Spalatro, while the direction in which his sympathies so strongly ran was at the same time not obscurely indicated by the fact that he excused himself from complying with the invitation. In 1624, and again in 1626, he undertook a journey to Spain, on behalf of the university, with reference to certain encroachments of the Jesuits on its exclusive privileges; in the second of these missions he was successful, the members of the Society of Jesus in the Low Countries being ordered to continue to observe the restrictions which had been laid upon them in 1612. In 1630 Jansen was made regius professor of Biblical exegesis; and in the same year, in connection with the recent introduction of the Reformed religion into Bois-le-Duc, he entered upon a controversy about Protestantism with the learned Voetius, the issue of which conclusively showed that he had grievously underestimated his adversary's strength. In 1635 he published a pseudonymous work entitled *Alexandri Patricii Armacani, Theologi, Mars Gallicus, seu de justitia armorum et fœderum Regis Galliæ libri duo*, embodying an argument and remonstrance against the policy of France in its recent alliance with the Protestant Gustavus Adolphus. For this supposed service to Spain he was rewarded in 1636 with the bishopric of Ypres. He was preparing for the press his great work upon St. Augustine, which had occupied him for twenty-two years, when he was cut off by sudden illness on May 6, 1638. By his last will the MSS. of this work were bequeathed to his chaplain Lamæus, and his friends Fromondus and Calenus, to be published "quam fidelissime;" at the same time he declared his obedience to the Roman See should any alterations be desired.

The title of the first work of Jansen against Voetius was *Alexipharmacon;* it called forth *Notæ in Alexipharmacon,* to which he replied in his *Spongia,* 1630. On the publication of Voet's *Desperata Causa Papatus* in 1635, Jansen handed over the further management of the controversy to Fromond, whose *Crisis* (1636) was met with Schook's *Desperatissima Causa Papatus.* Among other works of Jansen are mentioned *Tetrateuchus sive Commentarius in IV. Evangelia* and *Pentateuchus sive commentarius in V. libros Moysis.* See Leydecker, *Historia Jansenismi* (Utrecht, 1695).

JANSENISM. The *Augustinus, seu doctrina S. Augustina de humanæ naturæ sanitate, ægritudine, et medicina, adversus Pelagianos et Massilienses* of Jansen, published in 1640, is a work in three folio volumes. The first of these is devoted to an historical exposition of the Pelagian and Massilian (semi-Pelagian) heresies; the second sets forth the Augustinian doctrine as to the state of innocence and the fallen state; while the third treats, in ten books, of the grace of Christ the Saviour. The sting of the work is to be found mainly in the epilogue, which draws a parallel, in various particulars, between the errors of the Massilians and those "recentiorum quorundam," the Jesuits being referred to. Its bearing upon previous controversy had become well known long before its publication: and while it was still in the press at Louvain strenuous efforts were made by the Jesuit party there, through the papal internuncio, to induce the university to prohibit its appearance, on the ground that various popes had forbidden that anything should be written on the delicate subject of the grace of God without express papal permission. These efforts not only failed to attain their immediate object, but had the effect of greatly stimulating public interest in the *Augustinus* when it appeared; and as soon as it arrived in Paris it was forthwith reprinted with the written approval of six of the most eminent doctors of the faculty of theology there. In 1641 the reading of the book, thus flung into the arena of theological controversy and ecclesiastical intrigue, was prohibited by the Inquisition; no opinion, however, was pronounced as to its doctrine, and the counter-agitation of the Jesuits in relation to it was condemned as inconsistent with the spirit of the papal injunctions already referred to. But the dispute did not admit of being thus quietly repressed, and accordingly, in 1643, the bull *In eminenti* of Urban VIII. was published, renewing and confirming the constitutions of Pius V. and Gregory XIII., as well as the decrees of Paul V. and of himself, and forbidding the reading of the *Augustinus,* not only on the ground that its appearance had not been sanctioned, but also because it contained various errors. This bull encountered a very general resistance in the Netherlands, on the part both of the university of Louvain and of the clergy at large; but ultimately, through the intervention of the Spanish Government, it was accepted (1651), subscription to it, however, not being insisted on. At the Sorbonne also it was badly received, and the dissatisfaction it had caused in France found expression in the *Apology for Jansen* by Arnauld in 1644, which was followed by a second in 1645. The strength of these *Apologies* lying largely in the fact that no particular doctrines of Jansenius had been condemned as heretical in the papal bull, the Jesuits, inflexible in their determination to secure the effectual condemnation of a book which told so powerfully against their distinctive theology, immediately set about obviating this weakness in their attack, and various attempts were accordingly made to formulate, in the shape of definite propositions, the heresy which they believed to exist. In 1646 eight such propositions were stated by Habert, "theologal" of Notre Dame, to be submitted to the judgment of the pope; subsequent successive adjustments reduced them in 1650 to five, which in the name of eighty-five French prelates were forwarded for condemnation to Rome. They were as follows:—(1) There are some commandments of God which just men, although willing and anxious to obey them, are unable with the strength they have to fulfil, and the grace by which they might fulfil them is also wanting to them; (2) in the state of fallen nature inward grace is never resisted; (3) in the fallen state merit and demerit do not depend on a liberty which excludes necessity, but on a liberty which excludes constraint; (4) the semi-Pelagians admitted the necessity of an inward prevenient grace for the performance of each particular act, and also for the first act of faith, and yet were heretical inasmuch as they maintained that this grace was of such a nature that the will of man was able either to resist or obey it; (5) it is semi-Pelagian to say that Christ died or shed his blood for all men without exception. The pope long resisted the pressure with which he was urged to pronounce upon these theses in an adverse sense; it is easy to understand why he should steadily have inclined to the old and simple expedient of enjoining silence upon disputants on either side of the controversy; for, if the Jansenist propositions had a Calvinistic ring about them, there was no denying that they also admitted of an Augustinian and therefore presumably of an orthodox interpretation. At length, however (May 1653), Innocent X. in the bull entitled *Cum occasione impressionis libri* pronounced the first four points heretical, while the fifth was declared to be false, with the addition that, if it was intended to convey the meaning that Christ died only for the elect, it was impious and blasphemous as well as heretical. This bull was accepted and promulgated in France and the Netherlands with the royal consent, and the victory of the Jesuits was quite decisive. The Jansenists still seemed indeed to have one line of defence left to them; they expressed themselves willing to condemn the five propositions in their heretical sense, but not as propositions of Jansen. This position, however, ceased to be tenable when, in September, 1654, the pope declared that the propositions were found in the *Augustinus* of Jansen, and that their condemnation, as doctrines of Jansen, was imperative. Arnauld nevertheless, with whom were the other Port Royalists (see PORT ROYAL), refused to yield. In the second of his "Letters" to a person of quality (the Duc de Luines), he argued that, while the Holy See had authority to decide with respect to doctrine, and every good Catholic owed submission not only "de respect" but also "de croyance" to such determinations, yet it might be mistaken on the question of "fact" whether a given book contained certain statements or not. The commotion which ensued called forth in January, 1656, the first and second of the *Provincial Letters* of Pascal, but these brilliant controversial efforts did not suffice to avert the expulsion of Arnauld from the Sorbonne (31st January, 1656). In the following year the theological faculty of Paris drew up a formula avowing full acceptance of the bull of Alexander VII., in which it had been specifically declared that the five propositions contained *de facto* Jansenist error. This document, sanctioned by the king in 1661, the clergy and all inmates of conventual establishments were called upon to sign, all who refused being treated as heretics. The leading Jansenists were compelled to go into hiding, and the nuns of Port Royal were subjected to imprisonment and other harsh treatment. Many of the clergy, with whom were four bishops, persisted in their refusal to sign, until at last, in September, 1668, the compromise called the "peace of Clement IX." was arranged, in virtue of which, by the omission of a single word ("purement"), assent was no longer required to the proposition that Jansen had actually taught the five propositions in a "purely" heretical sense. The respite from controversy and persecution thus secured was not of long duration. The Jesuits were quite unable to make a moderate use of the power of which they were now so fully ascertained. Arnauld was driven into Holland, where he found congenial society and apt disciples in Catholic circles, and particularly at Delft. In 1705 a bull was obtained from Clement XI. in which the heretical character of Jansen's teaching, in Jansen's sense, was authoritatively asserted, and thus the peace of Clement IX. was destroyed. This measure ultimately led, in 1710, not only to the breaking up of the establishment at Port Royal, but also to the destruction of the very buildings. Louis XIV. was further induced to approach the pope for a decision upon the doctrine contained in Quesnel's *Réflexions morales sur le Nouveau Testament*, a work of practical edification, which, published in 1693–94, had attained great popularity in France, and been recommended by many bishops, including the cardinal-archbishop of Paris, De Noailles, but was suspected of latent Jansenism. In this way the bull *Unigenitus* (1713) was obtained, in which no fewer than one hundred and one propositions taken from Quesnel were condemned as erroneous and heretical. The result was to divide the French Church into two parties, the acceptants or constitutionists, and the appellants or anticonstitutionists; but again the Jesuit influence was able to secure the ultimate defeat (1728) of Noailles and his party, and in 1730 the bull was formally registered as the law of the kingdom. Oppressed Jansenism now changed its method of defence. Reports of miracles wrought in the cemetery of St. Medard, Paris, at the grave of François de Paris, a young Jansenist deacon who had died in 1727, began to be circulated; and the spot became a pilgrimage centre daily visited by thousands of fanatics. It was in vain that the place was walled up (giving occasion to the witty epigram "De par le Roi, défense à Dieu De faire miracle en ce lieu"); portions of earth which had been taken from the grave were equally efficacious, and the number of convulsionary prophets of coming ruin to the state and church continued to increase. Repression by imprisonment and other violent means was vainly attempted; but as the novelty of the movement wore off the excitement gradually died down; and after the middle of the 18th century, the appellants or Jansenists of France ceased to make any figure in the public view. Their cause may be said to have been buried in the grave of François de Paris. In Holland the history of the disciples of Jansen followed a different course. The Catholics there, though steadfastly refusing to be called Jansenists, became deeply imbued with his views; at their head was the archbishop of Utrecht, who on this account was deprived by the pope in 1704. In 1723 the chapter there secured the consecration of a successor (which the pope had steadily refused) by an appellant bishop; in similar circumstances bishops were consecrated at Haarlem and Deventer also, and the separatist church thus constituted still subsists, though its members in 1869 were under 6000. Its adherents claim to be disciples of St. Augustine and members of the Catholic Church, of which they recognize the pope as the visible head, although they deny his infallibility.

For the earlier stages of the history of Jansenism, see Leydecker, *Historia Jansenismi*, 1695, and the anonymous work of Gerberon, *Histoire Générale du Jansenisme*, 1700. Modern authorities are Sainte-Beuve, *Port-Royal*, 1840–48, 3d ed. 1867; Reuchlin, *Geschichte v. Port-Royal*, 1839–44; and Bouvier, *Étude critique sur le Jansénisme*, 1864.

JANSSEN, or JANSEN (sometimes JOHNSON), CORNELIUS (1590–1665), painter, was born at Amsterdam about 1590. About 1618 he went to England, where he was patronized by James I. and the court. Under Charles I. he continued to paint the numerous portraits which adorn very many of the mansions and collections of England; but in 1648, after the outbreak of civil war, he retired to Holland, where his brush was busy till his death in 1665. Janssen's pictures, chiefly portraits, are distinguished by clear coloring, delicate touch, good taste, and careful finish. He generally painted upon panel, and often worked on a small scale, sometimes producing replicas of his larger works. A characteristic of his style is the very dark background, which throws the carnations of his portraits into rounded relief.

JANSSENS, or JANSENS, VAN NUYSSEN, ABRAHAM (1567–1632), painter, was born at Antwerp in 1567. He studied under Jan Snellinck, was a "master" in 1602, and in 1607 was dean of the master-painters. Till the appearance of Rubens he was considered perhaps the best historical painter of his time. The styles of the two artists are not unlike. In correctness of drawing Janssens excelled his great contemporary; in bold composition and in treatment of the nude he equalled him; but in faculty of color and in general freedom of disposition and touch he fell far short. A master of chiaroscuro, he gratified his taste for strong contrasts of light and shade in his torchlights and similar effects. Good examples of this master are to be seen in the Antwerp museum and the Vienna gallery. The stories of his jealousy of Rubens and of his dissolute life are quite unfounded. He died at Antwerp in 1632.

JANSSENS, or JANSENS, VICTOR HONORIUS (1664–1739), painter, was born at Brussels in 1664. After seven years in the studio of an obscure painter named Volders, he spent four years in the household of the duke of Holstein. The next eleven years Janssens passed in Rome, where he took eager advantage of all the aids to artistic study, and formed an intimacy with Tempesta, in whose landscapes he frequently inserted figures. Rising into popularity, he painted a large number of cabinet historical scenes; but, on his return to Brussels, the claims of his increasing family restricted him almost entirely to the larger and more lucrative size of picture, of which very many of the churches and palaces of the Netherlands contain examples. In 1718 Janssens was invited to Vienna, where he stayed three years, and was made painter to the emperor. The statement that he visited England is based only upon the fact that certain fashionable interiors of the time in that country have been attributed to him. Janssen's coloring was good, his touch delicate, and his taste refined. He died in 1739.

JANUARIUS, ST., or SAN GENNARO, the patron saint of Naples, according to the Roman Breviary, was bishop of Benevento, and flourished towards the close of the 3d century after Christ. On the outbreak of the persecution by Diocletian and Maximian, he was taken to Nola and brought before Timotheus the governor of Campania on account of his profession of the Christian religion. After he had withstood various assaults upon his constancy, he was at last sentenced to be cast into the fiery furnace, through which he passed wholly unharmed. On the following day, along with a number of fellow martyrs, he was exposed to the fury of wild beasts, which, however, contrary to their nature, laid themselves down in tame submission at his feet. Timotheus, again pronouncing sentence of death, was struck with blindness, but immediately healed by the powerful intercession of the saint, a miracle which converted nearly five thousand men on the spot. The ungrateful judge, only roused to further fury by these occurrences, caused the execution of Januarius by the sword to be forthwith carried out. The body was ultimately removed by the inhabitants of Naples to that city, where the relic became very famous for its miracles, especially in counteracting the more dangerous eruptions of Vesuvius. His clotted blood, preserved in a glass phial, even to this day is wont to liquefy and bubble up as if but recently shed whensoever it is placed within sight of the martyr's head. So far the Breviary. This liquefaction of the blood, which is brought about at least twice a year, on May 1 and on September 19, the day assigned to this saint in the Roman calendar, is a miracle the recurrence of which is observed by believing Neapolitans on each occasion with various festivities extending over a whole week. The Januarius of Cordoba, to whom along with Saints Faustus and Martialis, a special local office is assigned in the Spanish Breviary, has a story which bears a general resemblance to the preceding; he also is stated to have suffered under Diocletian and Maximian, but the scene of his martyrdom was Cordoba. His day is October 13, and the invention of his remains is commemorated on November 26. The number of minor saints of this name is very considerable; the cognomen appears to have been somewhat common.

JANUARY, the first month in our present calendar, consists of thirty-one days. It was, however, not the first month of the year in the British Isles till the reformation of the calendar was made in 1752, when the legislature, by an Act passed in the preceding year, altered the mode of reckoning time from the Julian to the Gregorian style. At this period it was directed that the legal year which had commenced in some parts of the country on March 25, and in others with January, should thenceforward be appointed to begin always on the 1st of January. January derives its name from the God Janus, who had two faces looking in opposite directions, and Macrobius states that it was dedicated to him because, from its situation, it might be considered to be retrospective to the past and prospective to the opening year. The consecration of the month took place by an offering of meal, salt, frankincense, and wine, each of which was new. On the first of this month all enmities were suspended, presents were exchanged, consuls installed, etc. The principal festivals now observed in this month are the following:—Jan. 1, New Year's Day, Feast of the Circumcision; Jan. 6, Epiphany, Twelfth-Day; and Jan. 25, Conversion of St. Paul. See CALENDAR.

JANUS, a Roman god, after whom the month of January was named. His temple was open in war and closed during peace, and the ceremony of closing it for the third time in Roman history was performed by Augustus, 29 B.C., when he had established his authority over the whole empire. This temple, which was in reality only an arch or gateway, facing east and west, stood near the forum. When most of the Roman gods were merged in Greek divinities, Janus retained his native character. Amid the obscurity that hangs over the genuine Roman religion, it is difficult to determine the nature and origin of Janus. It is probable that he was the chief deity of one of the races which were united in the Roman people, and that his worship was maintained beside, but overshadowed by, that of Jupiter, the chief deity of another of these races. The hill of Janus, Janiculum, lay on the north or Etruscan side of the Tiber, and was doubtless the seat of his original worshippers. An Etruscan origin is thus suggested, and most authorities accept this hypothesis. The Romans themselves thought that Janus and the feminine Jana, *i.e.*, Diana, were sun and moon; and the names are commonly assimilated to the Greek Zήν, *i.e.*, Δίην. If, however, Janus was an Etruscan god, belonging to the Etruscan element in Rome, he must then be identified with the Etruscan deity Ani, the form of the name being prompted by the word *janua*, as Janus is the god of opening and beginning. The god is represented with two faces looking in opposite directions, a design found on the coins of the Etruscan Volaterra, but possibly due to the influence of Greek art.

See Preller, *Röm. Myth.*; Gerhard, *Griech. Myth.*, ii.; Hartung, *Relig. der Römer*; Schwegler, *Röm. Geschichte*, etc.; Deecke, *Templum von Piacenza.* Mommsen in his history proposes a different view.

JAPAN.

THE empire of Japan consists of a long chain of islands separated from the eastern coast of Asia by the Seas of Japan and Okhotsk, and extending from 24° to 50° 40′ N. lat., and from 124° to 156° 38′ E. long. It commences with the Kurile Islands and descends in a southwesterly direction to the Loochoo group, to which the Japanese Government reasserted their claim in 1875. The southern portion of the island of Saghalien was ceded to Russia in exchange for the Kuriles. The whole empire is called by the natives *Dai Nippon*, or "Great Japan;" but *Nippon* or *Nihon* is often employed alone. *Nippon* means literally "sun's origin," *i.e.*, the land over which the sun first rises, and thus denotes the position the empire occupies in the extreme East. The principal islands may be enumerated as follows:—

Plate IX.

1. The main island, which does not bear any special name. In many of the older geographical works it is stated that *Nippon* is the distinctive appellation of this one island, but by the Japanese themselves the name is applied only to the whole country.
2. Kiushiu (lit., "the nine provinces").
3. Shikoku (lit., "the four provinces").
4. Yezo.
5. Sado.
6. Tsushima.
7. Hirado (often wrongly written Firando).
8. Awaji.
9. Oshima ("Vries Island") and the chain adjacent to it, terminating with Hachijô (misspelt on charts Fatsisio).
10. Iki, with several smaller isles.
11. The Oki group.
12. The Gotô group.
13. The Bonin group.
14. The Riukiu (Loochoo) group.
15. The Kurile group (Chijima; lit., "the thousand islands").

Owing to the lack of reliable surveys, it is exceedingly difficult to form a correct estimate of the area of the Japanese empire. A few years ago the Government instituted surveying operations under the direction of skilled foreign engineers, and an ordnance map of the city of Tôkiô has already been prepared and published; but any correct calculation of the size of the whole country can hardly be obtained for some years to come. In a work on general geography published a few years ago by the Education Department at Tôkiô, the area of Japan is stated to be 24,780 square *ri*, which measurement, taking the linear *ri* as equal to 2.45 English miles, gives a total of about 148,742 miles, or nearly one-fourth more than the area of the United Kingdom. This estimate, however, is founded on maps which are far from correct.[1]

Divisions.

The old division of Japan into provinces was made by the emperor Seimu (131–190 A.D.), in whose time the jurisdiction of the sovereign did not extend further north than to a boundary line running from the Bay of Sendai, on the east coast

---

[1] Even in ordinary Japanese maps there are noticeable very glaring discrepancies as to distances, etc. The common measurement of length is the *ri*, equivalent, as has been said above, to about 2.45 miles. The *ri* usually contains 36 *chô*, though in the extreme western portion of the country 50 *chô* are sometimes reckoned to the *ri*. In hilly regions we often meet with what is termed the "mountain *ri*," which is one-half of the ordinary one. In former days, in stating distances along the roads, etc., the space occupied by temple enclosures was not reckoned, and thus the traveller had often to traverse a far longer route than that actually noted in the guide-books. The minor linear measures are the *sun*, or inch, 10 of which make the *shaku*, which is as nearly as possible equivalent to our foot; 6 *shaku*, or 71½ English inches, make up the Japanese *ken*, while the *jô* contains 10 *shaku*. See recent works on Japanese weights and measures by Mr. W. Bramsen.

of the main island, to near the present treaty port of Niigata on the west coast. The northern portion beyond this line was then occupied by barbarous tribes, of whom the Ainos (still to be found in Yezo) are probably the remaining descendants. The whole country was then divided into thirty-two provinces. In the 3d century the empress Jingô, on her return from her victorious expedition against Corea, portioned out the empire into five home provinces and seven circuits, in imitation of the Corean system. By the emperor Mommu (696–707) some of the provinces were subdivided so as to increase the whole number to sixty-six, and the boundaries then fixed by him were resurveyed in the reign of the emperor Shômu (723–756). The old division is as follows:—

I. The *Go-kinai*, or "five home provinces," *i.e.*, those lying immediately around Kiôto, the capital, viz.:—

Yamashiro[1]	also called Jôshiu.	Idzumi,	also called *Senshiu*.
Yamato,	" Washiu	*Setsu*,	" Sesshiu.
Kawachi,	" Kashiu.		

II. The seven circuits, as follows:—

1. The *Tôkaidô*, or "eastern-sea circuit," which comprises fifteen provinces, viz.:—

Iga	or Ishiu.	Kai	or *Kôshiu*.
Isé	" *Seishiu*.	*Sagami*	" *Sôshiu*.
Shima	" Shishiu.	Musashi	" *Bushiu*.
Owari	" *Bishiu*.	Awa	" *Bôshiu*.
Mikawa	" *Sanshiu*.	*Kadzusa*	" Sôshiu.
Tôtômi	" *Enshiu*.	*Shimôsa*	" Sôshiu.
Suruga	" *Sunshiu*.	*Hitachi*	" Jôshiu.
Idzu	" Dzushiu.		

2. The *Tôzandô*, or "eastern-mountain circuit," which comprises eight provinces, viz.:—

Ômi	or *Gôshiu*.	Kôdzuké	or *Jôshiu*.
Mino	" Nôshiu.	Shimotsuké	" *Yashiu*.
Hida	" Hishiu.	Mutsu	" *Ôshiu*.
Shinano	" *Shinshiu*.	*Déwa*	" Ushiu.

3. The *Hokurikudô*, or "northern-land circuit," which comprises seven provinces, viz.:—

Wakasa	or *Jakushiu*.	*Etchiu*	or Esshiu.
Echizen	" Esshiu.	*Echigo*	" Esshiu.
Kaga	" *Kashiu*.	*Sado* (island)	" Sashiu.
Noto	" Nôshiu.		

4. The *Sanindô*, or "mountain-back circuit," which comprises eight provinces, viz.:—

Tamba	or Tanshiu.	*Hôki*	or Hakushiu.
Tango	" Tanshiu.	Idzumo	" *Unshiu*.
Tajima	" Tanshiu.	Iwami	" *Sékishiu*.
Inaba	" *Inshiu*.	*Oki* (group of islands).	

5. The *Sanyôdô*, or "mountain-front circuit," which comprises eight provinces, viz.:—

Harima	or *Banshiu*.	*Bingo*	or Bishiu.
Mimasaka	" *Sakushiu*.	Aki	" *Geishiu*.
Bizen	" Bishiu.	*Suwô*	" Bôshiu.
Bitchiu	" Bishiu.	Nagato	" *Chôshiu*.

6. The *Nankaidô*, or "southern-sea circuit," which comprises six provinces, viz.:—

Kii	or *Kishiu*.	*Sanuki*	or Sanshiu.
Awaji (island)	" Tanshiu.	*Iyo*	" Yoshiu.
Awa	" *Ashiu*.	*Tosa*	" *Toshiu*.

7. The *Saikaidô*, or "western-sea circuit," which comprises nine provinces, viz.:—

Chikuzen	or Chikushiu.	*Higo*	or Hishiu.
Chikugo	" Chikushiu.	*Hiuga*	" Nisshiu.
Buzen	" Hôshiu.	*Ôsumi*	" Gûshiu.
Bungo	" Hôshiu.	Satsuma	" *Sasshiu*.
Hizen	" Hishiu.		

III. The two islands, viz.:—

1. Tsushima or *Taishiu*.
2. *Iki* " Ishiu.

Upon comparing the above list with a map of Japan it will be seen that the main island contains the *Go-kinai*, *Tôkaidô*, *Tôzandô*, *Hokurikudô*, *Sanindô*, *Sanyôdô*, and one province (Kishiu) of the *Nankaidô*. Omitting also the island of Awaji, the remaining provinces of the *Nankaidô* give the name *Shikoku* ("the four provinces") to the island in which they lie; while the *Saikaidô* coincides exactly with the large island of *Kiushiu* ("the nine provinces"). This name *Kiushiu* must not be confounded with that of the one province of *Kishiu* on the main island.

In 1868, when the rebellious nobles of Ôshiu and Déwa, in the *Tôzandô*, had submitted to the *mikado* (the emperor), those two provinces were subdivided, Déwa into Uzen and Ugo, and Ôshiu into Iwaki, Iwashiro, Rikuzen, Rikuchiu and Michinoku (sometimes also called Mutsu). This increased the old number of provinces from sixty-six to seventy-one. At the same time there was created a new circuit, called the *Hok'kaidô*, or "northern sea circuit," which comprised the eleven provinces into which the large island of Yezo was then divided (viz., Oshima, Shiribéshi, Ishikari, Téshiwo, Kitami, Ifuri, Hitaka, Tokachi, Kushiro, and Nemuro) and the Kurile Islands (Chijima).

Another division of the old sixty-six provinces was made by taking as a central point the ancient barrier of Osaka on the frontier of Ômi and Yamashiro,—the region lying on the east, which consisted of thirty-three provinces, being called the *Kuantô*, or "east of the barrier," the remaining thirty-three provinces on the west being styled *Kuansei*, or "west of the barrier." At the present time, however, the term *Kuantô* is only applied to the eight provinces of Musashi, Sagami, Kôdzuké, Shimotsuké, Kadzusa, Shimôsa, Awa, and Hitachi,—all lying immediately to the east of the old barrier of Hakoné, in Sagami.

Chiu-goku, or "central provinces," is a name in common use for the *Sanindô* and *Sanyôdô* taken together. *Saikoku*, or "western provinces," is another name for Kiushiu, which in books again is frequently called *Chinsei*.

Each province (*kuni*) is divided into what may be termed departments (*kôri*). The latter vary in number according to the size of the province. In the old system there were altogether six hundred and twenty-nine departments, but the addition of the *Hok'kaidô* has raised the number to considerably over seven hundred.

For purposes of administration the whole of the empire except the *Hok'kaidô* was again divided in 1872 into three cities (*fu*) and seventy-two prefectures (*ken*). The three cities are Yedo, Ôzaka, and Kiôto. In 1869 Yedo also received the name of Tôkiô, or "eastern capital," as opposed to Saikiô (the new name for Kiôto), or "western capital." This was in consequence of the removal of the emperor's court from his old capital to Yedo. It may, however, be here remarked that, whilst the Japanese invariably speak of *Tôkiô Fu*, "the city of Tôkiô," they use the name *Kiôto Fu*, "the city of Kiôto," and not, as might have been supposed, *Saikiô Fu*. The limits of the prefectures (*ken*) were irrespective of the boundaries of the provinces. There were originally seventy-two, but a gradual process of amalgamation has considerably reduced the list; and in August, 1876, a Government notification fixed the prefectures at only thirty-five, the names of which are given in the following table:—

The Home Provinces (1½)—Sakai, Hiôgo (part)—apart from the two cities of Ôzaka and Kiôto.
Tôkaidô (8)—Ibaraki, Chiba, Saitama, Kanagawa, Yamanashi, Shidzuoka, Aichi, Miyé—apart from the city of Tôkiô.
Tôzandô (11)—Awomori, Iwadé. Miyagi, Fukushima, Akita, Yamagata, Tochigi, Gumma, Nagano, Gifu, Shiga.
Hokurikudô (2)—Niigata, Ishikawa.
Sanindô (1)—Shimané.
Sanyôdô (3½)—Hiôgo (part), Okayama, Hiroshima, Yamaguchi.
Nankaidô (3)—Wakayama, Ehime, Kôchi.
Saikaidô (5)—Ôida, Fukuoka, Kumamoto, Nagasaki, Kagoshima.

From the above list it may be noted that in many instances a single *ken* now contains several provinces or portions of different provinces. In 1878–9 a separate prefecture (called the Okinawa *ken*) was created, including the Riukiu (Loochoo) group. Until that time Riukiu was governed by a king of its own, but being in fear of its powerful neighbors, China and Japan, it had for many years sent tribute to both. A question of double allegiance thus arose, which was solved by Japan asserting its sovereignty; the king received the title of noble of Japan, and the Okinawa *ken* was established. Whether this action on the part of the Japanese Government may not embroil them with China is a point not yet definitety settled.

---

[1] The names given in italics are those more commonly used. Those in the first column are generally of pure native derivation; those in the second column are composed of the Chinese word *shiu*, a "province," added to the Chinese pronunciation of one of the characters with which the native name is written. In a few cases both names are used.

Smaller islands.

The total number of islands in the Japanese group, exclusive of the four main ones, is stated to be over three thousand. Many of these are mere barren rocks, uninhabited and uncultivated. Others, again, are of considerable size and exceedingly fertile, particularly the countless islets in the *Suwo Nada*, commonly known to Europeans under the name of the "Inland Sea," lying between the main island on the north and the islands of Shikoku and Kiushiu on the south. The whole coast-line, too, is dotted with islands and rocks of all sizes. Ôshima, also called Vries Island, at the mouth of the Bay of Yedo, is one of considerable importance. It has many inhabitants, and its volcanic soil is fairly productive. It is the most northerly of a chain which extends as far south as the 27th degree of north latitude. The Bonin group, termed by the Japanese the Ogasawara Islands, lies far out at sea, to the south of the entrance of Yedo Bay; it consists of two large islands, separated from each other by 50 miles of sea, and a host of islets. The Japanese Government reasserted their sovereignty over the Bonins in 1878. The Kurile Islands are merely a chain of barren rocks, and the few inhabitants are chiefly occupied in the fisheries and in hunting the sea-otter. Due south from the province of Satsuma lie several minor groups, terminating with the Riukiu Islands. The Gotô group (lit. "the five islands") extends in a westerly direction from the province of Hizen, in Kiushiu, to which it belongs.

Bays.

Coast line.—The bays along the coast are often of considerable size. The Japanese, strange to say, have no names for either their bays or their straits, the appellations found on maps and charts having been given by European navigators. Yedo Bay is perhaps the best known to foreigners, but Sendai Bay (on the east coast) and that running up to the north of the island of Awaji, and commonly called Ôzaka Bay, are also famous. Owari Bay, in the province of that name, is of considerable size. The Bay of Kagoshima, in the province of Satsuma, is long and narrow; it is well known to foreigners as having been the scene in 1863 of an attack on Kagoshima (the castle-town of the lord of Satsuma) by a British squadron. The entire coast-line teems with smaller bays and harbors, in many of which good anchorage can be found. An English man-of-war, the "Sylvia," has for several years been employed as a surveying vessel to obtain soundings of the principal inlets and draw up charts of the coast.

Straits.

The straits best known to foreigners are the Straits of Tsugaru (often miscalled Saugur in maps), which separate Yezo from the northern portion of the main island; the Straits of Akashi and of Idzumi, near the Island of Awaji, at the eastern entrance of the "Inland Sea;" and the Straits of Shimonoséki, at the extreme western end of that sea, separating the main island from Kiushiu. The attack on Shimonoséki in 1864 by an allied squadron of English, French, Dutch, and American vessels, in retaliation for injuries inflicted upon foreign shipping passing through the straits by the batteries erected by the lord of Chôshiu (in which province Shimonoséki is situated) is a matter of historical note. The current in these straits is so swift that vessels have difficulty in stemming it unless under steam.

Capes.

It will suffice to name a few of the almost countless promontories and capes along the coast. On the extreme north of the main island we have Riuhi-zaki and Fujishi-zaki in the Tsugaru Straits. Inuboyé no saki lies on the east coast just below the mouth of the Tonégawa. Su-saki in Awa and Miura no misaki (called by foreigners Cape Sagami) mark the entrance to the Bay of Yedo. Cape Idzu is in the province of that name, and at the southern extremity of the province of Kishiu are Idzumo-zaki and Shiwo no misaki. Muroto-zaki and Ashizuri no misaki are the chief promontories on the south coast of the island of Shikoku, both being situated in the province of Tosa. Tsutsui-zaki in Hiuga, and Sata no misaki (better known to Europeans as Cape Chichakoff) in Ôsumi are the extreme southern points of the island of Kiushiu. In the island of Yezo there are several noticeable promontories.

Harbors.

The number of harbors and trading-ports called by the natives *ô-minato* ("large harbors") is stated to be fifty-six, but many of these would no doubt be inaccessible to foreign vessels of heavy tonnage. They are, however, admirably adapted for the accommodation of coasting junks and fishing craft, and these vessels have no lack of places of refuge in heavy weather. In many instances the entrances are blocked by one or more small islands or rocks, which render the anchorage within even more secure. In Yezo the port of Matsumae is the one best known. The Bay of Yedo abounds with harbors, some being situated within the mouths of the rivers. In Idzu, Shimoda is one that deserves special mention; the water is there very deep, and it is a common occurrence for vessels beating up towards the entrance of Yedo Bay to seek shelter in it. Shimidzu in Suruga is also a well-known place; a long sandy promontory covered with fir trees defends the port from the sea on the south. In the province of Shima are Toba and Matoya, both magnificent harbors. The "Inland Sea" is, of course, especially rich in this respect, the harbor of Mitarai, between two islands near the province of Aki, being a favorite place of call. In Shikoku, Takamatsu in Sanuki is the best known. Kiushiu is abundantly supplied, Kagoshima in Satsuma being one of the largest and best. The harbors on the northwest coast of the main island are also numerous, and each of the islands Tsushima, Iki, and Sado possesses one. The ports thrown open to foreign trade since the year 1859 are Yokohama, Hiôgo (Kôbé), and Niigata on the main island, Nagasaki in Kiushiu, and Hakodaté in Yezo.

Mountains.

Mountains.—Japan, as might reasonably be expected in a country where volcanoes are so numerous, is very hilly; and in some districts there are many mountains of considerable height. The most extensive plains are those of the Kuantô and Echigo, and the north of Ôshiu. The provinces of Mikawa, Mino, and Owari are also very flat. Halfway between Tôkiô (Yedo) and Kiôto lies the great watershed of the east of Japan, the table-land of Shinano, elevated some 2500 feet above the level of the sea. The ridges around or forming part of it are very lofty, particularly those of the province of Hida. The plain of Yedo lies to the east of this table-land, about 1800 feet below, while to the north the hills gradually slope away to the province of Echigo. Another range of considerable height runs due north from Aidzu to Tsugaru, thus dividing the old provinces of Ôshiu and Déwa. The province of Kai is almost entirely surrounded by mountains, and the hill scenery in Kishiu and near Kiôto is exceedingly fine. Shikoku possesses some large ridges, and the south of Kiushiu, especially in the provinces of Higo and Hiuga, is also by no means deficient. Even in the wide rice-plains throughout the country there may often be seen minor elevations or hills, rising abruptly, in some cases to a considerable height. The mountain best known to foreigners is Fuji-san,—commonly, but most erroneously, termed Fusiyama or Fusi-no-yama in geographical works. It rises more than 12,000 feet above high-water level, and is in shape like a cone; the crater is 500 feet deep. It stands on the boundary line of the three provinces of Kai, Suruga, and Sagami, and is visible at a considerable distance seaward. It is regarded by the natives as a sacred mountain, and large numbers of pilgrims make the ascent to the summit at the commencement of summer. The apex is shaped somewhat like an eight-petaled lotus flower, and offers from three to five peaks to the view from different directions; it is visible from no less than thirteen different provinces. Though now apparently extinct, it was in former times an active volcano, and Japanese histories mention several very disastrous eruptions. The last of these occurred in 1707, when the whole summit burst forth into flames, the rocks were shattered and split by the heat, and ashes fell even in Yedo (about 60 miles distant in a direct line) to a depth of several inches.[1] After Fuji-san may be mentioned Gassan in the province of Uzen, Mitaké in Shinano, the Nikkô range in Shimotsuké, Ôminé in Yamato, Hakusan in Kaga, Tatéyama in Etchiu, Kirishima-yama in Hiuga, Asosan in Higo, Tsukuba-san in Hitachi, Onsen-ga-také in Hizen, Asama-yama in Shinano, Chôkaizan in Ugo, and Iwaki in Michinoku. There are several active volcanoes in the country, that best known to foreigners being Asama-yama. This mountain is 8500 feet in height. The earliest eruption of which records now exist seems to have taken place in 1650; after that the volcano was only feebly active for one hundred and thirty-three years, when there occurred a very severe eruption in 1783. Even so lately as 1870 there was a considerable emission of volcanic matter, at which time, also, violent shocks of earthquake were felt at the treaty port of Yokohama. The crater is very deep, with irregular rocky walls of a sulphury character, from apertures in which sulphurous fumes are constantly sent forth. At present very little is known in regard to the heights of the mountains, but the subject is one that has attracted the attention of foreign residents in Japan for several years past. The following is an approximate estimate:—

1. Fuji-san	12,365 feet	(above high-water mark at the town of Numadzu).
2. Asama-yama . . .	8,500 "	
3. Nantai-zan (the loftiest hill in the Nikkô range) . . .	7,800 "	
4. Ôyama, in Sagami .	5,400 "	
5. Tsukuba-san . . .	5,000 "	
6. Onsen-ga-také . .	4,100 "	(according to Siebold).

Rivers.

Rivers.—The rivers of Japan, although very numerous, are in no case of any great length. This of course is easily explained by the fact that the islands are narrow and hilly. The longest and widest river is the Tonégawa, which rises in the province of Kôdzuké, and flows due east to the Pacific, throwing off, however, at Sékiyado in Shimôsa, a branch that flows into Yedo Bay near the capital.[1] The length of the Tonégawa is over 170 miles. At Sékiyado (which is a large and thriving river-port) the water is no less than 40 feet in depth, while a few hundred yards above that town foot-passengers can ford the stream without any great difficulty. The Shinano-gawa and Kiso-gawa, both of which take their rise in the province of Shinano, rank next to the Tonégawa. The former flows first in a northwesterly direction, next due north, and then northeast through Echigo to the sea at Niigata; the Kiso-gawa flows to the westward and then to the south, between the provinces of Mino and Owari, and finally falls into the sea at Kuwana. The Ôi-gawa rises in the southwest of Kai, and traverses the province of Tôtômi; it is less remarkable for the length of its course than for the great breadth of its bed, which near the mouth is 2½ miles across, its current being also very swift. The Fuji-kawa, flowing due south from the mountains of Kai through the province of Suruga, is famous as being one of the swiftest streams in all Japan. In the north, the Sakata-gawa flows due west from the range of mountains separating the provinces of Uzen and Rikuzen, and enters the Sea of Japan at the town of Sakata, from which it takes its name. Nearly all the rivers are fed by countless tributary streams, which in many cases form a complete network in the lower portions of the country, and thus greatly facilitate transport from the interior to the coast. On the Tonégawa and a few other streams of greater depth small river steamers ply for several miles; but in general large flat-bottomed boats, drawing as a rule but a few inches of water, are employed. It is by no means uncommon to see boats of this description in process of construction even in remote country villages on the banks of streams in which the depth of water is but from 12 to 18 inches at ordinary times. Floods are of frequent occurrence, especially at the commencement of summer, when the melting of the snows on the mountain ranges causes at times an almost incredible downflow from the higher lands to the plains. These floods invariably occasion great destruction of property, as the bridges spanning the rivers are only built of wood and turf, supported by piles. In some localities, notably in the western portion of the province of Shimôsa, traversed by the southern branch of the Tonégawa, large tracts of rice-land are almost entirely destroyed by the fine sand from the bed of the river, swept over the fields during inundation. In addition to boats, long rafts of timber are constantly to be seen descending the larger rivers; the logs are floated down in a rough state, to be afterwards thinned and sawn up at the seaport towns where the timber trade is carried on.

Lakes.

Lakes.—Japan contains a large number of lakes, but only one—the Biwa Lake, in the province of Ômi—is worthy of special notice on account of its size. Its length is about 50 miles, and its greatest breadth about 20 miles. At a village called Katada, some 10 miles from its southern extremity, it suddenly contracts to a breadth of only a mile and a half, after which it again slightly expands. This lake derives its name from a fancied resemblance to the *biwa* or Japanese lute; the scenery around it is particularly beautiful, and it is a favorite resort for sightseers from Kiôto. An ancient Japanese legend asserts that in the year 286 B.C., in the reign of the emperor Kôrei, there occurred a terrible earthquake, when the earth opened and Lake Biwa was formed; at the same time rose the mountain called Fuji-san. In Ômi there is a small hill called Migami, which in shape slightly resembles Fuji-san, and this fact is quoted by the natives in support of the theory connecting the lake with the sacred mountain; and the inhabitants of Ômi were privileged to undertake the ascent of Fuji-san after only seven days' purification, instead of one hundred days', the prescribed term for all other persons. After Biwa may be noted the lakes of Chiuzenji, Suwa, and Hakoné, all of which lie far above the level of the sea. That of Chiuzenji is situated at the foot of the mountain called Nantai-zan, in the Nikkô range in the province of Shimotsuké. The scenery in its vicinity has given rise to the proverb that he who has not seen Nikkô should not pronounce the word "beautiful." The lake of Suwa is in the province of Shinano, and can be reached by a road called the Nakasendô, running northwest from Tôkiô through the heart of the country to Kiôto. The Hakoné Lake lies in the range of hills bearing the same name just to the east of Fuji-san; the water is exceedingly cold, and of great depth. A Japanese legend, indeed, asserts that it has never been fathomed. The hill scenery around it is very picturesque, and large numbers of foreign residents from Tôkiô and the neighboring port of Yokohama visit it during the summer months. The Inawashiro Lake, in the province of Iwashiro, is said to be about 10 miles in length. It is fed by two streams flowing from the east and northeast, while out of it flows the Aka-no-gawa, which falls into the sea near Niigata. It is surrounded by hills of no great elevation; the temperature there is cool, and in winter the streams are frozen for several weeks. On the boundary line of the provinces of Hitachi and Shimôsa there are also large tracts of water, or lagoons (Japanese *numa*), fed by the Tonégawa; these, though not actually lakes, may almost be classed under that heading, as their connection with the river itself consists in many cases of but one narrow outlet. Those of chief note are the Ushiku-numa in Hitachi, and the Imba-numa, Téga-numa, and Naga-numa in Shimôsa. The country in this vicinity is as a rule exceedingly flat, but the Imba-numa is for some distance along its eastern shore bordered by small hills, thickly wooded down to the water's edge, the whole forming a very pretty landscape. The lagoons are well stocked with fish, the large eels found in the Ushiku-numa being especially prized for excellence of flavor: in the winter months they teem with wild fowl. The inhabitants of the numerous villages along the shores are, in fact, almost entirely maintained by fishing and shooting or trapping.

---

[1] According to Japanese tradition, it was upheaved in a single night from the bottom of the sea, about twenty-one and a half centuries ago, and its history has been carefully recorded. From July to September the wants of the pilgrims are supplied by temporary restaurants distributed along the principal routes of ascent, one of which is from the east by Subashiri, another from the north by Yoshida, and a third from the south by Murayama. The white vestments usually worn by the pilgrims are stamped by the priests at the top with various seals and images. Sir Rutherford Alcock and a party of Englishmen ascended the mountain in 1860, and since then it has frequently been visited by Europeans. The height as then estimated by Lieutenant Robinson was 14,177 feet; but a mean of several subsequent measurements gives only 12,200. In the great crater there are neither sulphuric exhalations nor steam. According to Dr. Von Drasche this is a circular bowl about 700 or 800 feet deep. The lavas are mainly dolomitic; those forming the walls of the crater are composed of anamesite, in which here and there grains of felspar are visible. The Japanese poets never weary in celebrating the praises of Fuji-san, and its conical form is one of the most familiar objects in Japanese painting and decorative art. See the notice of Sir R. Alcock's ascent in *Journal R. G. Soc.*, 1861; of A. Jeffrey's ascent in August, 1872, in *Proc. of R. Soc.*, 1873; and of Dr. Von Drasche's in his "Bemerkungen über die japanischen Vulkanen Asa-yama . . . . und, Fusiyama," in *Jahrbuch K. K. Geol. Reichsanstalt*, 1877; also J. Rein's "Der Fuji-no-yama und seine Besteigung," in Petermann's *Mittheilungen*, 1879.

[1] See Naumann's excellent paper, "Ueber die Ebene von Yedo," in Petermann's *Mittheilungen*, 1879.

Minerals.

Minerals.—Japan is particularly rich in minerals among which may be specially mentioned gold, silver, iron, copper, coal, and stone of various kinds. The gold was first discovered and melted in the year 749 A.D., during the reign of the emperor Shômu; it came from the department of Oda in the province of Ôshiu, and in the following year more was found in the province of Suruga. During the long period of Japan's seclusion from the rest of the world, the gold discovered remained in the country, and the amount augmented year by year; and this no doubt tended in a great degree to convey to the earlier foreign visitors the impression that the supply was far more abundant than was actually the fact. The quantity of bullion exported by the Portuguese during their stay in Japan (1550–1639) may be estimated at the least at fifty-nine and a half millions sterling, or an average of £660,000 yearly. Dr. Kaempfer even speaks of some years with an export of two and a half millions of gold. From 1649 to 1671 the Dutch also exported large quantities, together with silver and copper, and the total value of gold and silver alone sent out of Japan during the 16th and 17th centuries may be estimated at nearly one hundred and three millions sterling. At an exhibition held in Kiôto in 1875 were shown about twenty samples of gold ore found in different provinces. The ore is generally poor, and many gold-yielding places are now lying unworked, because the increased cost of labor renders it very difficult to work them with profit. Pure auriferous quartz has been found in the provinces of Satsuma and Kai, gravel in Ôsumi, and quartz in Rikuchiu and at the mine of Aikawa in the island of Sado. The mode in which the Japanese work the gold ores nearly resembles Western methods. They understand perfectly the separation of even the smallest quantities of gold dust from stones and gravel by means of a system of washing and levigation. They do not, however, possess any good process for the separation of gold from silver, and hence all Japanese gold contains a greater or less proportion of the latter metal. Silver ore was discovered accidentally in the year 667 A.D., in the island of Tsushima; this ore produced the first Japanese silver metal, in the year 674. From 1400 to 1600 it was obtained and melted in Japan in far larger quantities than at the present time. It generally occurs in comparatively small quantities as an admixture in several copper and lead ores. The principal mines are in the provinces of Jôshiu, Iwami, and Setsu; but it is also found mixed with lead in Hida, Iwashiro, Echizen, Echigo, Rikuchiu, Suwô, Hiuga, and Higo. Of the numerous iron ores to be found, the principal is magnetic iron ore, which forms the main basis of the Japanese iron industry. Loadstone was discovered in the year 713 in the province of Ômi. The exact date of the first manufacture of iron is unknown; it is certain only that the Japanese have worked their iron ores from the 10th century onward. The principal seats of the industry are in the provinces of Idzumo, Bingo, Ôshiu, Hiuga, Tajima, Wakasa, Bizen, Bitchiu, Shinano, Tôtômi, Kai, Suruga, and Satsuma. The best steel is manufactured in Harima, Hôki, Idzumo, and Iwami. The excellent temper of the Japanese sword-blades is well known. The most noted smiths formerly resided in the provinces of Sagami, Bizen, and Kishiu, and in the neighborhood of Kiôto. Japanese legends assert that the first sword was forged in the reign of the emperor Sūjin (97–30 B.C.), but this statement is of course open to considerable doubt. Copper was, it is said, smelted in Japan for the first time in the year 698 at Inaba in the province of Suwô; and in the year 708 the first Japanese copper coin was cast, in the province of Musashi. Since the 10th century enormous quantities of ore have been smelted, and this metal formed the chief trade of the Dutch and Chinese at Nagasaki from 1609 to 1858,—the amount exported by the former being more than four millions of piculs and by the latter undoubtedly still more.[1] It is perhaps the metal most commonly found in Japan, and is used for all kinds of household goods, doors to storehouses, ornaments, temple-furniture, mirrors, bronzes, smoking utensils, and current coinage. It is found and smelted in all parts of the country, particularly in the northern and western provinces, and its export figures considerably in the trade returns of the treaty ports during the past few years. As a rule Japanese copper is exceedingly free from the presence of injurious metals. After the year 1600 many bronze guns were cast in Japan, the workmanship being exceedingly good; these old guns are often to be seen even now, though by far the larger number, together with the temple bells, etc., made from the same material, have been broken up and exported as old bronze by European merchants. Of other metals Japan also produces lead, quicksilver, and tin. Coal is found in large quantities, particularly in Kiushiu, where the province of Hizen contains the well-known mines of Karatsu, and in the island of Takashima, near the treaty port of Nagasaki. Coal-fields also exist in the large northern island of Yezo. Nearly all the steamers plying between Japan and China coal at Nagasaki, where this trade attracts a good deal of enterprise. The numerous quarries throughout the empire afford large quantities of stone. Marble and granite are found principally in the provinces of Shinano, Mino, and Kôdzuké; freestone is also procured from Setsu and Idzu. The huge blocks of which the ramparts of the castle at the capital are built were originally brought from the latter province. In the old castle of Ôzaka, in Setsu, there is an enormous piece of granite measuring thirteen paces in length and about 9 feet in height. The foundations of all the more ancient temples throughout the country are formed of large blocks, and these, together with the long flights of steps, still remain to prove the durability of the old style of architecture. It is strange, however, that at the present moment stone is but sparingly used for building purposes; even in the great cities the dwelling-houses are almost entirely constructed of timber, stone being used only for bridges and for edifices on a larger scale than ordinary.[1]

---

[1] 1 picul = 133⅓ ℔. avoirdupois.

Climate.

Climate.—The climate of Japan, as might naturally be expected in view of the great length of the chain of islands, varies to a considerable extent in different localities.[2] Thus we find that while the Riukiu and Bonin groups, lying close to the tropics, enjoy perpetual summer, the Kurile Islands in the far north of the empire share the arctic temperature of Kamtchatka. The climate is, on the whole, favorable for Europeans, although its frequent changes often prove trying to foreign residents. All the mountain ranges are wrapped deep in snow throughout the winter months; indeed, from many peaks snow never entirely disappears. In the northern provinces it has been known to fall to a depth of no less than 8 feet, and the province of Echigo is specially noted in this respect. At the treaty port of Niigata, in that province, small bamboo sheds are built out from the fronts of the dwelling-houses so as to form a covered way along which pedestrians can pass when the rest of the town is snowed up. At Tôkiô snow falls some three or four times during the winter; it covers the ground to a depth of from 3 to 5 inches on an average, but does not lie long. In January, 1876, however, a remarkably severe snowstorm occurred, when the whole city was covered to a depth of 2 feet or more; so unusual was this phenomenon deemed that a large number of photographs of the landscape were taken to perpetuate the memory of the event. Farther to the south and west the cold is not, as a rule, so intense, while in the summer months the heat is far greater. Near Yokohama and Tôkiô the summer commences in May, but the heat only becomes oppressive in July and August, when the thermometer has been known to register 104° F. At the breakup of the summer there are heavy rains, which render the interior of the houses exceedingly damp and uncomfortable. After the winter there also occurs a short rainy season. The best months for making excursions into the interior are April and October, as the weather is then generally of a mean temperature. Southerly winds blow from the middle of May, and often even from April, until the end of August. On the Sea of Japan southwest winds (known as the southwest monsoon) prevail, while in Yokohama and all parts of the country adjacent to the Pacific Ocean southerly winds predominate. The southwest monsoon sets in in April and prevails until the middle or end of September; but the regularity with which the monsoons set in and blow on the Chinese coasts is unknown in Japan. On calm days land and sea breezes alternate on the Japanese coast in the same manner as elsewhere. Mention should here be made of the violent revolving storms, known as typhoons, which are closely related to the West Indian hurricanes and to the cyclones of the Indian seas. These generally occur in the months of July, August, or September; they invariably occasion great damage, not only to shipping, but also to property on land. Large trees are often snapped asunder like mere twigs, while the roofs and chimneys of foreign-built edifices suffer severely. As a rule, one of these storms is experienced every year.

Earthquakes.

Destructive earthquakes have often taken place, while slight shocks are of frequent occurrence, several having been felt lately within the space of a few days (1881). Japanese histories furnish numerous records of these phenomena. The ancient legend of the great earthquake in 286 B.C., when Mount Fuji rose and the Biwa Lake was formed, has already been noticed; but it is not possible to procure reliable information for several centuries later than the date mentioned in that fanciful tale. The earliest authentic instance is perhaps that which is said to have occurred in 416 A.D., when the imperial palace at Kiôto was thrown to the ground. Again, in 599, the buildings throughout the province of Yamato were all destroyed, and special prayers were ordered to be offered up to the deity of earthquakes. In 679 a tremendous shock caused many fissures or chasms to open in the provinces of Chikuzen and Chikugo, in Kiushiu; the largest of these fissures was over 4 miles in length and about 20 feet in width. In 829 the northern province of Déwa was visited in similar manner; the castle of Akita was overthrown, deep rifts were formed in the ground in every direction, and the Akita river was dried up. To descend to more recent instances, in 1702 the lofty walls of the outside and inside moats of the castle of Yedo were destroyed, tidal waves broke along the coast in the vicinity, and the road leading through the famous pass of Hakoné (in the hills to the east of Fuji-san) was closed up by the alteration in the surface of the earth. Of late years these disastrous earthquakes have fortunately been of more rare occurrence, and the last really severe shocks were those felt in 1854 and 1855. In the former year the provinces of Suruga, Mikawa, Tôtômi, Isé, Iga, Setsu, and Harima, and also the large island of Shikoku, were severely shaken. It was this earthquake which destroyed the town of Shimoda, in the province of Idzu, which had been opened as a foreign port in Japan, while a Russian frigate, the "Diana," lying in the harbor at the time was so severely damaged by the waves caused by the shock that she had to be abandoned. The earthquake of 1855 was felt most severely at Yedo, though its destructive power extended for some distance to the west, along the line of the Tôkaidô. It is stated that on this occasion there were in all 14,241 dwelling-houses and 1649 fire-proof storehouses overturned in the city, and a destructive fire which raged at the same time further increased the loss of life and property.

Meteorological observations have for some time back been carefully taken at the college in Tôkiô, and efforts are now (1881) being made to start a seismological society in the capital. Japan is peculiarly a country where a learned society of this nature could gather most interesting and useful information from actual observation.

General Aspect of the Country.—The physical structure of the islands alternates between mountain ranges, rugged upland regions, wide plains, and lands consisting of an endless succession of dale and down, level fields and small ridges. Yezo has not yet become thoroughly known to foreigners; but it possesses both hills and plains, the latter being in some cases very sandy. The northern portion of the main island of Japan is exceedingly mountainous, though large moors and uncultivated steppes are to be observed on all sides. To the southeast lies the wide plain of Yedo, remarkably fertile, and closed in by lofty ranges. From this away to the west the country is hilly in the centre, with lower ground to the north and south; while in the large islands of Kiushiu and Shikoku the high ground is far in excess of the plain.

Vegetable Products.—The greater part of the cultivated land consists of rice-fields, commonly termed "paddy-fields." These are to be

Rice.

Oesterr. Ges. f. Meteor.*, 1878; and T. H. Tizard's *Contributions to the Meteorology of Japan* (London, 1876).

seen in every valley or even dell where farming is practicable; they are divided off into plots of square, oblong, or triangular shape by small grass-grown ridges a few inches in height, and on an average a foot in breadth,—the rice being planted in the soft mud thus enclosed. Narrow pathways intersect these rice-valleys at intervals, and rivulets (generally flowing between low banks covered with clumps of bamboo) feed the ditches cut for purposes of irrigation. The fields are generally kept under water to a depth of a few inches while the crops are young, but are drained immediately before harvesting. They are then dug up, and again flooded before the second crop is planted out. The rising grounds which skirt the rice-land are tilled by the hoe, and produce Indian corn, millet, and edible roots of all kinds. The well-wooded slopes supply the peasants with timber and firewood. The rice-fields yield two crops yearly. The seed is sown in small beds, and the seedlings are planted out in the fields after attaining the height of about 4 inches. The finest rice is produced in the fertile plains watered by the Tonégawa in the province of Shimôsa, but the grain of Kaga and of the two central provinces of Setsu and Harima is also very good. Prior to the revolution of 1868-9 the fiefs of the various *daimiô* or territorial nobles were assessed at the estimated total yield of rice. Until very recently there existed a Government prohibition against the export of the grain. Rice not only forms the chief food of the natives, but the
Saké. national beverage, called *saké*, is brewed from it. In color the best *saké* resembles very pale sherry; the taste is rather acid. None but the very best grain is used in its manufacture, and the principal breweries are at Itami, Nada, and Hiôgo, all in the province of Setsu. Of *saké* there are many varieties, from the best quality down to *shiro-zaké*, or "white *saké*," and the turbid sort, drunk only in the poorer districts, known as *nigori-zaké;* there is also a sweet sort, called *mirin*.

The whole country is clothed with most luxuriant
Forests. vegetation, except in some of the very hilly regions. The principal forests consist of *Cryptomeria* (Japanese cedar) and pine; the ilex, maple, mulberry, and giant camellia also abound. Some of the timber is remarkably fine, and the long avenues following the line of the different high roads afford a most grateful shade in summer. On the road from Tôkiô to the celebrated temples at the foot of the Nikkô hills is an avenue nearly 50 miles in length, of cedars and pines, some of the trees being fully 50 or 60 feet in height. Unfortunately these noble specimens are fast disappearing, as the wood-cutter's axe and saw have been ruthlessly plied during the past few years. In Japanese wood-felling a common plan is to kindle a fire at the roots of the tree; this dries up the sap in the trunk, and renders the wood harder and firmer. Two principal varieties of the pine occur, called respectively the red and the black, from the color of the bark. The former thrives in sandy ground, while the latter grows in softer black soil. It is said that if one of these varieties be transplanted to the soil bearing the other, it will also in time change in color till it resembles its new companions. The tints of the maple foliage, bright green in summer and brown-red in autumn, contribute in no slight degree to the beauty of a Japanese landscape. The mulberry tree grows well in the eastern regions, where the silkworm is reared and the silk industry carried on. The bamboo is especially useful and plentiful. Bamboo clumps are seen at frequent intervals in the rice-land; they line the river banks, and flourish equally well on the higher grounds; and it would be
Fruits. impossible to enumerate the multifarious purposes for which the cane is used. Of fruit-trees Japan possesses the orange, apple, walnut, chestnut, plum, persimmon, damson, peach, and vine. The fruit, however, is in most cases of quality far below that of European orchards. The best oranges come from the province of Kishiu; these have a smooth and very thin rind, and no seeds. The larger oranges, with thick and rough rind, grow throughout the country. The so-called apple resembles the large russet, but only in color and shape; it has absolutely no flavor, and is hard and stringy. The plum, of which there are several varieties, may be said to be the best fruit obtained, next to the orange and persimmon. This latter is exceedingly plentiful and has two varieties, the soft and the hard; it is often dried, and sold packed in boxes like figs. The peaches are not remarkable either for size or flavor. The best grapes are grown in the provinces of Kai and Kawachi; both the black and the white are found, but the fruit is small, and only continues in season for a short time. The tea-plant grows well in Japan, and tea forms one of the chief exports to foreign countries. The best leaf comes from the neighborhood of Uji, in the province of Yamashiro, to the southeast of Kiôto; but it is also largely exported from Yokohama, being produced in the fertile district in the east of the main island. The production of vegetable wax has always formed one of the principal industries of the island of Kiushiu, and the trees bearing the wax berries grow in great number on the hill slopes and round the edges of most of the cultivated fields (excepting rice-land) in the provinces of Hizen, Higo, Chikuzen, and Chikugo; in Satsuma, however, they are not so plentiful. The cotton-plant, introduced from India in 799, also thrives. The camphor tree is found in most parts of the country, particularly in some of the higher regions; on account of its agreeable smell the wood is largely used in the manufacture of small cabinets and boxes. Amongst the minor vegetable products the sweet potato is particularly plentiful; it has several varieties, that known as the Satsuma potato being perhaps the best. Watermelons and gourds of various sizes and shapes thrive in the more sandy soil; and onions, carrots, small turnips, tomatoes, and beet-root are also cultivated. The brinjal bears a dark purple fruit shaped like a pear. The long white radish, called by the Japanese *daikon* (lit. "great root"), is exceedingly common, and forms one of the chief articles of food amongst the lower classes, who eat it either raw or dried and pickled; the average size of the root is from 18 inches to 2½ feet in length, and 1½ inches or so in diameter. Beans and peas can also be grown. The climate of Yezo is said to be very favorable for both wheat and barley, and it is probable that in future years this large island may thus prove a source of considerable gain to the Japanese. In the island of Shikoku the indigo plant is found in abundance, and it also occurs in the eastern portion of the main island. The poppy is grown in Shikoku. In ferns and creepers of various kinds Japan is particularly rich, but her list of flowers is not very lengthy. The rose, peony, azalea, camellia, lotus, and iris are, however, to be seen.[1]

Animals.—As regards animal life Japan is well provided. The domestic animals comprise the
Mammals. horse, ox, dog, and cat; while the wilder tribes are represented by the bear, deer, antelope, boar, fox, monkey, and badger. In Yezo are found very large bears, so powerful as to be able to pull down a pony; in the central provinces of Shimotsuké and

---

[1] The great authority on the Japanese flora is Franchet and Savatier's *Enumeratio plantarum in Japonia sponte crescentium*, Paris, 1875-1879, 2 vols., which contains 2743 species of phanerogamic plants—700 species more, that is, than were given by Miquel, who in 1866 contributed a survey of the subject to the *Mededeelingen* of the *K. Akad. van Witensch.* (Amsterdam), and in 1870 published *Catal. Musei Botanici* (Leyden, part i., *Flora Japonica*) on the basis of the rich collections of the Leyden Museum. Much interesting matter will also be found in Rein's contributions to Petermann's *Mittheilungen*, 1875 and 1879; in the *Mittheil. der deutsch. Ges. Ost-Asiens;* and in Knipping, "Ozaka, Kiôto, etc., in Nippon," in Petermann's *Mittheil.*, 1878. It has been shown that the Japanese flora as a whole has a great similarity not only to that of the neighboring Asiatic continent but also to that of North America, the coincidences being most frequent, however, not with the flora of the eastern but with that of the western coast.

Shinano a small black species exists. The deer, antelope, and monkey are caught in nearly all the hilly regions throughout the whole country. Sheep do not thrive, although the hardier goat does—the reason assigned for this being that the "bamboo grass," with its sharp-edged and serrated blade, proves very deleterious as pasture. In the western part of the province of Shimôsa a sheep-farm was started a few years ago; but it is not yet possible to judge whether the venture will prove successful in any great degree. In the meantime sheep are usually imported from China. The Japanese horses, or rather ponies, are not very powerful animals; they stand on an average from 13 hands 2 inches to 14 hands 2 inches in height. They are thick-necked and rather high-shouldered, but fall off in the hind quarters. Large numbers of ponies are imported from China. At the Shimôsa farm experiments have been made in putting an Arab or Barb to a Japanese mare; the half-bred animal thus obtained compares very favorably with the pure native breed, being of better shape and of far superior speed. The oxen are small but sturdy, and it is probable that, if the vast tracts of moorland at present lying uncultivated in the northern provinces were utilized for breeding cattle, substantial gains would be secured. The ordinary Japanese dog is very like the Eskimo dog, and is generally white, grey, or black in color. A few, however, are red-brown, and much resemble the fox; these are used by the hunters in the pursuit of game. There are several species of monkeys, and large numbers of these animals, taken in the hills of Kai and Shinano, are brought into the Tôkiô market, where they are sold for food; the flesh is white and very palatable.

Birds.

Wild birds[1] are represented in Japan by the cormorant, the crane (*Grus leucauchen*, Jap. *Tan-chiyan*, is the national crane), wild goose (at least eight species), swan (*Cygnus musicus*), mallard, widgeon, teal (four species, including falcated teal or Yoshi-gamo), pheasant, woodcock, wood-pigeon, plover, and snipe. There are also found the bittern, the heron, and the white wader, commonly known as the "paddy-bird." Prior to 1868 there existed very stringent laws prohibiting the ordinary Japanese from shooting or snaring the crane, goose, or swan. One species of bittern was even deemed worthy of a special rank of nobility, and is to this day known as the *go-i sagi*, or "bittern of the fifth grade,"—a quaint conceit, reminding us of the well-known jest of Henry VIII. in knighting the loin of beef. Many varieties of domestic fowls exist, the tiny bantam being one of the most celebrated; there is also a large game-cock said to have been originally imported from Siam. Flocks of tame pigeons are to be seen in nearly every farm-yard. The lark, swallow, and common sparrow are as numerous as in England. One of the most beautiful birds is the drake of the species generally called the "mandarin-duck" (*Aix galericulata*, Jap. *Oshi-dori*), found on small streams in country districts. When in full plumage this drake presents an exquisite combination of bright colors, and two broad feathers, of a deep golden tint and shaped like a fan, stand erect above the back from under the wings.

Fishes.

The Japanese fisheries are marvellously productive, and afford occupation to the inhabitants of the countless villages along the coasts. Herrings are caught off the island of Yezo, and the bonito, cod, sole, crab, and lobster are found in great plenty on nearly every part of the coast. In some of the rivers in Yezo, and also in the Tonégawa, fair-sized salmon are caught; and there is also a fish very much resembling the trout. The *tai*, a large fish of the carp species, is esteemed a special delicacy: of this there are two varieties,—the red *tai*, caught in rivers with sandy beds, and the black *tai*, found at the mouths of streams where the darker soil of the sea bed commences. Eels, small carp, and fish of many other kinds are freely taken in nearly all the minor lakes and streams. The oyster is found in considerable quantities in the shallows at the head of the Bay of Yedo and elsewhere. To any student of zoology a visit to Japan would prove in the highest degree interesting.[2]

Communication.—The means of transport, although not exceptionally good, have yet improved considerably during the past few years.

Railway.

There are but two lines of railway in Japan, both very short. The first (opened to traffic in 1872) runs from Tôkiô to Yokohama, and is but 18 miles in length. Shortly afterwards a line of about the same length was completed between the port of Hiôgo and the city of Ôzaka, and this line was in 1877 extended from the latter place to the city of Kiôto, the opening ceremony taking place on the 5th of February in that year. Both these lines were opened by the emperor in person. Surveying operations have been going on for some years, with a view to the construction of other railways, and in some districts the direction of future lines has already been staked out. Mention has been already made of the great facilities for transport afforded by the network of small streams throughout the country.

Roads.

The system of roads, too, is very fair, although in remote districts the work of supervision and repair is not done so carefully as is really necessary. Of the highways the Tôkaidô is that best known to foreigners. This is nearly 307 miles in length, and connects Kiôto and Tôkiô. Its course lies along the southeastern coast of the main island, and it is the only road in the country which is named after the circuit that it traverses. Dr. Kaempfer, one of the early residents in the Dutch factory at Nagasaki, gives in his well-known *History of Japan* a graphic and entertaining account of his journey from Nagasaki to Yedo in 1691, part of which he made by the Tôkaidô. One of the most remarkable works recently completed by Japanese labor, without aid from foreign engineers, is a tunnel on this road. It is situated about 6 miles to the westward of the large town of Shidzuoka, and about 106 miles west of Tôkiô. The tunnel is cut through a high ridge of hills intersecting the Tôkaidô. The old line of road passed over the summit of the ridge, but this engineering work renders the journey far shorter and easier. A good roadway some 18 feet in breadth leads up the ridge on either side, in a zigzag direction, so as to admit of wheeled vehicles passing along it with perfect safety; and the tunnel runs through the centre of the hill, thus connecting the two roadways. The passage is about 200 yards in length; at the eastern end it is faced with stone, then the roof is supported by timber arches for some distance; a small portion is next hewn out of a stratum of solid rock; and finally the timber arches are again continued as far as the western extremity. The breadth throughout is about 12 feet, and the height about 10 feet. As the tunnel runs in a curved line, owing to the formation of the hill, and is thus very dark, lamps are placed in it at intervals; while at each end are fixed in the ground several posts, each surmounted by a brightly polished oblong plate of tin, to reflect the rays of the sun into the interior. This important work was commenced in 1873, but was not completed until March, 1876. Another road between Kiôto and Tôkiô is the Nakasendô, also called the Kiso-kaidô; this runs through the heart of the country, to the north of the Tôkaidô, and is a little over 323 miles in length. Some of the hill scenery on the western half of this road is exceptionally grand; the elevation in many parts is so great that in winter the roadway is much obstructed by snow. The longest high road in Japan is the Ôshiu-kaidô, running northward from Tôkiô to Awomori on the Tsugaru Straits. It traverses the provinces of Musashi, Shimotsuké, Iwashiro, Rikuzen, Rikuchiu, and Michinoku, and its length is given at nearly 444 miles. Two roads from Tôkiô to Niigata exist, the longer being about 264 and the shorter about 225 miles in length; the latter is said to be impassable in winter. Neither of these possesses a name, and for a considerable distance each is identical with the Nakasendô. Another road, which, though far shorter than those already mentioned, still possesses great interest for the traveller on account of the beauty of its mountain scenery, is the Kôshiu-kaidô. It unites Tôkiô and Kôfu, the chief town in the province of Kai, and is 77 miles in length; from Kôfu a continuation of it joins the Nakasendô at Shimono-suwa, in the province of Shinano, some 32 miles further. To the west of Kiôto lie many other roads, but they are of less importance because there is little traffic in the Sanindô, while that of the Sanyôdô is conducted in junks which ply on the Inland Sea. In the islands of Shikoku and Kiushiu the roads are stated to be very bad, particularly in the mountainous regions lying in the southern portion of the latter, on the confines of the provinces of Hiuga, Higo, and Satsuma.

---

[1] T. Blakiston and H. Pryer, in their "Catalogue of the Birds of Japan" (*Trans. of the As. Soc. of Japan*, 1880), mention three hundred and twenty-five species of birds, and they do not consider the list as anything like complete. Of these, one hundred and eighty species also occur in China, and about one hundred are identical with those of Great Britain. The Straits of Tsugaru (15 or 20 miles across) appear to be a line of zoological demarcation, as neither the sheep-faced antelope (*Nemorhædus crispa*), the Japanese monkey (*Innuus speciosus*), nor the boar (*Sus leucomystax*) have crossed into Yezo. *Heralda glacialis*, *Tetrates bonasia*, *Picus minor*, *Dryocopus martius*, *Corvus corax*, *Ampelis garrula*, *Acredula caudata*, *Leucosticte brunneinucha*, *Gecinus canus*, *Garrulus Brandti*, are apparently confined to Yezo, while *Lobivanellus inornatus*, *Phasianus versicolor* and *Phasianus Sœmmeringii* (the two species of pheasant peculiar to the country), *Gecinus awokira*, *Cyanopica cyanus*, *Garrulus japonicus*, *Acredula trivirgata*, are not found north of Tsugaru Straits. One species of cuckoo (*Hierococcyx fugax*, Horsf.) is supposed to portend earthquakes, its cry resembling the Jap. *jishin*, earthquake. Among favorite cage-birds are *Zosterops japonica* (Jap. *Meiiro*); *Parus varius* (Jap. *Yamagara*); the Japanese nightingale, *Cettia cantans* (Jap. *Uguhisu*); the thrush, *Turdus cædis* (Jap. *Kuro tsugu*); and *Emberiza sulphurata*, the bunting. The robin, the most expensive bird sold by the dealers, seems to be imported from Corea. Compare Temminck and Schlegel, *Fauna Japonica*, and papers by Blakiston, H. Whitely, and Swinhoe, in *Ibis*, 1862, 1867, 1874, and 1877.

[2] A. R. Wallace has devoted a chapter of his *Island Life* to the treatment of Japan and Formosa. He points out that 40 species of mammals are know to exist in Japan, and that 26 of these are peculiar; whereas of the 165 land-birds already registered only 16 species are peculiar. He gives a list of 40 species of birds which are common to Great Britain and Japan, and adds that it does not sufficiently indicate the resemblance, as there are many birds which, though distinct species from the British, have the same general appearance. Bleeker, the great Dutch naturalist, has *Bijdr. tot de kennis der ichthyol. fauna van Japan* (Amsterdam and Batavia, 1854, etc.), and "Enumération des espèces de poissons actuellement connus du Japon," in *Verhandl. der Kon. Akad. v. Wet.* (Amsterdam, 1879). See also Adam's *Travels of a Naturalist in Japan and Manchuria* (London, 1870).

The question of road superintendence is one of which the Japanese Government has fully realized the importance. At a general assembly of the local prefects held at Tôkiô in June, 1875, there was brought forward a bill to classify the different roads throughout the empire, and to determine the several sources from which the sums necessary for their due maintenance and repair should be drawn. After several days' discussion all roads were eventually ranged under one or other of the following heads:—

I. National roads, consisting of—
  Class 1. Roads leading from Tôkiô to the various treaty ports.
  Class 2. Roads leading from Tôkiô to the ancestral shrines of Japan in the province of Isé, and also to the various *fu* ("cities"), or to the military stations.
  Class 3. Roads leading from Tôkiô to the various *ken* ("prefecture") offices, and those forming the lines of connection between the various *fu* and military stations.
II. *Ken* ("prefecture") roads consisting of—
  Class 1. Roads connecting different prefectures, or leading from the various military stations to their several outposts.
  Class 2. Roads connecting the head offices of the various cities and prefectures with their several branch offices.
  Class 3. Roads connecting noted localities with the chief town of such neighborhoods, or leading to the seaports convenient of access from those localities.
III. Village roads, consisting of—
  Class 1. Roads passing through several localities in succession, or merely leading from one locality to another.
  Class 2. Roads specially constructed, for benefit of irrigation, pasturage, mines, manufactories, etc., consequent upon measures determined by the local population.
  Class 3. Roads constructed for the benefit of Shintô shrines, Buddhist temples, or for cultivation of rice-fields and arable land.

Of the above three headings, it was decided that all national roads should be maintained at the national expense, the regulations for their repair, cleansing, etc., being entrusted to the care of the prefectures along the line of route, but the cost incurred being paid from the imperial treasury. *Ken* roads are to be kept up by a joint contribution from the Government and from the particular prefecture, each paying one-half of the sum needed. Village roads, being for the convenience of the local districts alone, are to be maintained at the expense of such districts under the general supervision of the corresponding prefecture. The width of the national roads was determined at 7 ken[1] for class 1, 6 ken for class 2, and 5 ken for class 3; the prefecture roads were to be from 4 to 5 ken; and the village roads were optional, according to the necessity of the case.

Vehicles.

On most of the high roads run small stage wagons of various sizes, but these are as a rule badly made, insecure, and for the conveyance of passengers alone. In the mountainous regions, and especially in the hills immediately behind the foreign settlement (Kôbé) at Hiôgo, in the province of Setsu, small bullock cars are to be seen. These are roughly made of untrimmed timber, and are anything but strong; each rests on three wheels of solid wood, and is drawn by one bullock. They are, however, very useful for the conveyance of blocks of stone from the hills, and for rough country work. In the large towns, and also on all fairly level roads, passengers may travel in small two-wheeled carriages called *jin-riki-sha;* these are in shape like a miniature gig, and are as a rule drawn by a single coolie, though for rapid travelling two men are usually employed. In the city of Tôkiô alone there exist over 10,000 of these *jin-riki-sha*, and various improvements as regards their style, shape, and build have been introduced since 1870, the year in which they first came into use. Many are of sufficient size to carry two persons, and on a good road they travel at the rate of about 6 miles an hour; the rate of hire is about 5d. per Japanese *ri*, or about 2d. per mile. For the transport of baggage or heavy goods large two-wheeled carts are in use; these are pushed along by four or six coolies. Until very lately the only vehicle employed in travelling was the palanquin. Of these there were two kinds, viz., the *norimono*, a large litter carried by several bearers, and principally used by persons of the better class, and the *kago*, still to be seen in hilly districts where carriages cannot pass. The *kago* is a mere basket-work conveyance, slung from a pole carried across the shoulders of two coolies; and it is easy to see that the substitution of the wheeled *jin-riki-sha* drawn by only one man was a great improvement as regards both economy of labor and facility of locomotion. In country districts, and wherever the roads are stony or narrow, long strings of pack-horses meet the eye. These animals are shod with straw sandals to protect the frog of the hoof, and their burden is attached by ropes to a rough pack-saddle without girths. They go in single file, and move only at a walk. To their necks is attached a string of small metal bells,—a survival of the ancient usage whereby a state courier was provided with bells to give timely warning of his approach at the different barriers along his route, and so to guard against any impediment or delay. The peasants also often employ oxen as beasts of burden in hilly regions; these animals, too, are shod with straw sandals, having a portion raised so as to fit into the cleft in the hoof. Burdens of moderate weight are usually carried by coolies, one package being fastened at each end of a pole borne across the shoulder. In remote districts even the Government mails are thus forwarded by runners. In all the post-towns and in most of the

---

[1] 1 ken=71½ inches.

Travelling guilds.

larger villages are established transport offices, generally branches of some head office in the capital, at which travellers can engage *jin-riki-sha*, *kago*, pack-horses, and coolies, or make arrangements for forwarding baggage, etc. The tariff of hire is fixed by the Government, and this is paid in advance, a stamped receipt being given in return. Most of the inns in the post-towns subscribe to one or another of the so-called travelling guilds, each of which has a head office in Tôkiô, and often in Kiôto and Ôzaka. Upon application at this office, the traveller can obtain a small book furnishing general information as to the route by which he proposes to proceed,—such as the distances between the halting-places, the names of rivers and ferries, and hints as to places of interest along his road. It also contains a full list of the inns, etc., enrolled on the books of that guild, a distinction being made between lodging-houses and places where meals alone are provided. To this list each landlord is obliged, at the traveller's request, to affix his stamp or seal at the time of presenting his account; and by this system cases of incivility or overcharge can be reported at the head office, or application made there in the event of articles being forgotten and left behind at any inn. The Japanese themselves seldom travel in the interior except under this system, and were foreign visitors only to follow their example they might avoid a good deal of the inconvenience they not unfrequently experience.

Treaty ports.

Castle towns.

Houses.

Towns.—The towns and villages are very numerous along the line of the great roads. The three great cities are Tôkiô (Yedo), Ôzaka, and Kiôto. The last named was the ancient capital, and had been in existence for centuries before Tôkiô, and also for a very considerable time before Ôzaka was built. Now, however, these two have rapidly outstripped Kiôto both in size and importance, and are in fact the two great centres of trade throughout the whole country. The emperor's court now resides at Tôkiô, and it is there that the foreign legations are stationed. The city of Ôzaka (often wrongly spelt Osacca) is purely mercantile; it is intersected by numberless canals spanned by bridges that are in some cases of great length, and a very large proportion of the buildings are storehouses for merchandise. The Japanese mint (opened in April, 1871), is at Ôzaka. Next in importance to these three cities may fairly be classed the various ports thrown open, under the treaties with Western powers, to foreign trade. Commencing from the north, we come first to Hakodaté (erroneously spelt Hakodadi) in the south of the island of Yezo. There is here no distinct foreign settlement, the houses of the few Europeans being mingled with those of the natives. The chief exports are dried fish and seaweed. On the main island the most northern port is Niigata, in the province of Echigo, where also no foreign settlement as yet exists. The trade is exceedingly small, owing to the bad anchorage. A bar of sand at the mouth of the river (the Shinano-gawa) prevents the approach of foreign-built vessels, and the roads off the river mouth are so unprotected that when a heavy gale blows the European ships often run across to the island of Sado for shelter. Some little trade, however, is carried on, the neighborhood being very fertile; rice and copper are the chief productions. Yokohama, about 18 miles to the south of the capital, and situated on the western shore of the Bay of Yedo, enjoys by far the greater proportion of the whole foreign trade of Japan. The foreign settlement is very large, and numerous bungalows and small villas of the European residents are also built on a hill (known as the "Bluff") overlooking the "settlement" proper. The chief exports are tea and silk; the former goes principally to the United States and to England, and the latter to the French markets. Large business transactions also take place in silkworm eggs and cocoons, as well as in copper, camphor, and sundry other articles of trade. Proceeding westward, we come to the port of Hiôgo, in the province of Setsu. The foreign settlement, generally called Kôbé, is not so large as that of Yokohama, but the streets are wider and more commodious. A railway connects this place with Ôzaka, where there is also a foreign settlement, though of very small size. The principal exports here are tea, silk, camphor, vegetable wax, etc. Nagasaki, the best known by name of all the open ports, is in the province of Hizen, in the large southwestern island of Kiushiu. The foreign settlement is small, though the native town is of considerable extent. Coal is the staple export. Dr. Kaempfer's *History of Japan* gives a most exhaustive and interesting description of the everyday life of the early Dutch residents at this port, where they were pent up in the tiny peninsula of Deshima (commonly misspelt Decima or Dezima) in the harbor. Throughout the rest of the country the largest towns are as a rule those that were formerly the seats of the territorial nobles (*daimiô*), and are even now commonly known as "castle-towns." It is easy to conceive that in the olden days, under the feudal system, the residence of the lord of the district formed a kind of small metropolis for that particular locality; and the importance thus attaching to the castle-towns has in most cases survived the departure of the nobles to the capital. The castles usually stood some slight distance from the rest of the town, often on a hill or rising ground overlooking it. In the centre rose the keep or citadel, a strong tower of three or five stories, commanding the whole of the fortifications; this was surrounded by high earthen ramparts, faced on the outside with rough-hewn blocks of stone and defended by a moat, which was often of considerable width. The gateways were square, with an outer and an inner entrance, constructed of stone and heavy timbers. The lines of fortification were as a rule three in number. Above the ramparts rose a slight superstructure of wattled stakes, whitewashed on the outside and loopholed for musketry and archers' shafts. The whole produced a very striking effect when viewed from some slight distance, the gray stone and the brighter whitewash showing distinctly from among the dark foliage of the trees in the pleasure grounds within the enclosure. It was not, however, every castle that was built on the scale just described; many of them were exceedingly small, and were defended only by narrow ditches and weak wooden gates, the buildings within being thatched with straw and hardly superior to the ordinary peasant's dwelling. Most of these castles have been demolished, but a few yet remain nearly intact to tell the tale of the former pomp and state of the feudal nobility. On the outskirts of the castle dwelt the retainers of the *daimiô*, their houses being sometimes situated within the outermost moat, and sometimes, again, completely beyond it. The houses of the townspeople still stand in their original positions. They are constructed almost entirely of wooden posts, beams, and planks, the roofs being generally tiled. The floors are raised to a height of about 18 inches from the level of the ground, and are covered with large straw mats an inch and a half in thickness. These mats are nearly all six feet in length by three in breadth, are covered with a layer of finely plaited straw, and have the edges bound with some dark cloth. The doors to the rooms are formed of sliding screens of wooden framework covered with paper; these are 6 feet high, and move in grooves in the beams fixed above and below them. In the houses of well-to-do persons, these slides are often covered with coarse silken stuff, or formed of finely planed boards, usually decorated with paintings. At one side of the room is generally seen a recess, with a low dais; on this various ornaments or curiosities are ranged, and a painted scroll is hung at the back of the whole. A few years back, before the wearing of swords was prohibited, a large sword-rack (often of finely lacquered wood) usually occupied the place of honor on the dais. The ceilings are of thin boards, with slender

Post towns.

cross-beams laid over them at intervals. Except in the larger towns, there are hardly any buildings of more than two stories, though the inns and lodging-houses sometimes have as many as four. The front of the dwelling is either left entirely open, or, with the better class of tradespeople, is closed by a kind of wooden grille with slender bars. Those who can afford it usually shut in the frontage altogether by a fence, through which a low gateway opens upon a small garden immediately in front of the entrance to the dwelling. At the back there is generally another tiny garden. All round the house runs a narrow wooden verandah, of the same height as the floor, over which the roof protrudes; this verandah is completely closed at night or in stormy weather by wooden slides known as "rain-doors," moving in grooves like the slides dividing the rooms in the interior. Next in importance to the castle-towns come the post-towns along the high roads, where travellers can obtain accommodation for the night, or engage conveyances and coolies for the road. The houses are similar to those already described, but are built on a smaller scale, and most of them are thatched instead of being tiled. The inns and tea-houses are the grand feature of these towns; as a rule the accommodation there to be obtained is excellent, though this is of course only on the great highways. In remote country districts the traveller is frequently forced to rough it, and put up with what he can find in the way of shelter. Each post-town possesses an office for the receipt, forwarding and delivery of the postal mails; as a rule the mayor or vice-mayor of the district is charged with this duty.

Villages.

Farming operations.

Rural Life.—The agricultural villages are often very poor places, the houses being dilapidated, and the food and clothing of the peasants meagre in the extreme. In many instances the farm-buildings are situated in the midst of the rice-fields or on a hill slope, at some little distance from the road. Even the women and children go out to till the ground from early morn until late in the evening, their labor being sometimes varied by felling trees or cutting brushwood on the hills. In some localities they eke out their means of livelihood by snaring birds, or by fishing in the numerous ponds and rivulets. Those who can afford to do so keep a pack-horse or an ox to be used either as a beast of burden or to draw the plough. The farming implements are in many cases very primitive. The plough is exceedingly small, with but one handle, and is easily pulled through the soft mud of the rice-fields by a single pony or a couple of coolies. To separate the ears of grain from the stalks the latter are pulled by hand through a row of long iron teeth projecting from a small log of timber; the winnowing fans are two in number, one being worked by each hand at the same time. The spades and hoes used are tolerably good implements, but the sickle consists merely of a straight iron blade, some 4 inches in length, pointed, and sharpened on one side, which projects from a short wooden handle about 15 inches long. When the grain is gathered in, the straw is stacked in small sheaves and left in the fields to dry, after which it is used for thatching or as litter for cattle. In the wilder districts the peasantry are wretchedly poor, and cannot indeed afford to eat even of the rice they cultivate; their ordinary food is millet, sometimes mixed with a little coarse barley. The potato and the long radish (*daikon*) are almost the only other articles of food within their means. Agrarian riots are not unfrequently occasioned by bad harvests or scarcity from other causes, and the consequences are sometimes very disastrous, the peasants, when once excited, being prone to burn or pillage the residences of the local officials or headmen of the villages. These riots do not, however, arise as in former days from the exactions of the lords of the soil. There is no doubt that prior to the revolution of 1868–69 the peasantry were in too many cases grievously oppressed by their feudal chiefs, especially on those estates owned by the *hatamoto* or petty nobility of the *shôgun's* court at Yedo. These nobles, with some very rare exceptions, resided continuously in the city, leaving their fiefs under the control and management of stewards or other officers; whenever money was needed to replenish the coffers of the lord, fresh taxes were laid on the peasantry, and should the first levies prove insufficient, new and merciless exactions were made. Under the present central Government, however, the condition of the Japanese agricultural classes has been greatly ameliorated. A fixed land-tax is levied, so that the exact amount of dues payable is known beforehand. In the event of inundations, poor harvests, or similar calamities, Government grants are constantly made to the sufferers.

Education.

Education.—Throughout the whole country schools have been established, for the support of which the Government often gives substantial assistance. The cost of tuition in these establishments is generally fixed at a rate within the means of the poorest classes. In most of the remote villages the schoolhouse is now the most imposing building.

Administration.

Law-courts.

Administration.—Court-houses have been erected in each prefecture, where the laws are administered by Government officials appointed by the department of justice at the capital. These courts are placed under a smaller number of superior courts, to which appeals lie, and these are in turn subordinate to a supreme court of appeal in Tôkiô. By a Government edict issued on the 13th of September, 1876, the titles and jurisdiction of the various courts were fixed as follows:—

1. Tôkiô court	Tôkiô *fu*, Chiba *ken*.
2. Kiôto court	Kiôto *fu*, Shiga *ken*.
3. Ôzaka court	Ôzaka *fu*, Sakai *ken*, and Wakayama *ken*.
4. Yokohama court	Kanagawa *ken*.
5. Hakodaté court	Hok'kaidô.
6. Kôbé court	Hiôgo *ken*, Okayama *ken*.
7. Niigata court	Niigata *ken*.
8. Nagasaki court	Nagasaki *ken*, Fukuoka *ken*.
9. Tochigi court	Tochigi *ken*, Ibaraki *ken*.
10. Urawa court	Gumma *ken*, Saitama *ken*.
11. Awomori court	Awomori *ken*, Akita *ken*.
12. Ichinoséki court	Iwadé *ken*, Miyagi *ken*.
13. Yonézawa court	Yamagata *ken*, Fukushima *ken*.
14. Shidzuoka court	Shidzuoka *ken*, Yamanashi *ken*.
15. Matsumoto court	Nagano *ken*, Gifu *ken*.
16. Kanazawa court	Ishikawa *ken*.
17. Nagoya court	Aichi *ken*, Miyé *ken*.
18. Matsuyé court	Shimané *ken*.
19. Matsuyama court	Ehimé *ken*.
20. Kôchi court	Kôchi *ken*.
21. Iwakuni court	Yamaguchi *ken*, Hiroshima *ken*.
22. Kumamoto court	Kumamoto *ken*, Ôida *ken*.
23. Kagoshima court	Kagoshima *ken*.

Four superior courts, having jurisdiction over the above, were then also established, viz.:—

1. Tôkiô superior court	Tôkiô, Yokohama, Tochigi, Urawa, Aichi, Shidzuoka, Niigata, and Matsumoto courts.
2. Ôzaka superior court	Kiôto, Ôzaka, Kôbé, Kanazawa, Matsuyama, Kôchi, Matsuyé, and Iwakuni courts.
3. Miyagi superior court	Awomori, Ichinoséki, Yonézawa, and Hakodaté courts.
4. Nagasaki superior court	Nagasaki, Kumamoto, and Kagoshima courts.

Police.

Small police stations have been erected in all towns and villages of any importance; along the high roads the system is carefully organized and well carried out, though in distant localities the police force is often wholly inadequate to the numbers of the population. The Japanese lower orders are, however, essentially a quiet and peaceable people, and thus are easily superintended even by a very small body of police. In the capital and the large garrison towns it is a different matter, and collisions frequently occur with the riotous soldiery. The military stations are established in some of the larger castles throughout the country, the principal garrisons being at Tôkiô, Sakura in Shimôsa, Takasaki, in Kôdzuké, Nagoya in Owari, Ôzaka in Setsu, Hiroshima in Aki, and Kumamoto in Higo.

Internal administration.

Since the restoration of the *mikado* Japan has undergone many changes. Innumerable measures of reform in the internal administration of the country have been introduced. The former territorial nobles surrendered their castles and muster-rolls of retainers to the central Government, and are now, in common with the old court nobles of Kiôto, classed under the one name of *kuazoku*, or simply "nobles." They now reside in Tôkiô, the capital of the empire. To this class of nobles belongs the former king of the Riukiu Islands. After the *kuazoku* come two other grades, called respectively the *shizoku* and the *heimin*, or, as they may be termed, the gentry and commoners. The former comprises the old *hatamoto*, or petty nobility of the shôgunate, and the *samurai*, or military families, from whom the retainers of the *daimiô* were recruited. The *heimin* include the peasantry, artisans, and traders. Thus the ancient "four classes" of the population have been reduced to three. The *han* system has been abolished, and the system of *ken*, or prefectures, directly under the control of officers of the central Government, established in its stead. The debts of the *han*, consisting chiefly of the redemption of their paper-currency, were also taken over, and this measure certainly involved the present administration in considerable financial difficulties from the very outset, so much so that large issues of Government notes and bonds have become necessary. A grand scheme for the capitalization of incomes was put into operation in August, 1876. The *daimiô*, on surrendering their muster-rolls to the crown, were relieved from the necessity of paying the incomes of their retainers, and, with the old *kugé* class, received certain allowances from the Government. It is probable that only the wealthier nobles found any hardship entailed upon them by this arrangement, for if we take into consideration the payments that had to be made by a *daimiô* under the old régime in the way of dues to the *shôgun*, and allowances to retainers, etc., it cannot be doubted that the lower grades of the former territorial chieftains are in many cases better off at present than they were before the revolution. Their old retainers, too, received from the Government certain fixed incomes, or pensions, calculated upon their former rates of pay, and thus became direct dependants of the nation instead of one particular *han*. In 1876, however, these allowances to both *kuazoku* and *shizoku* alike were commuted, according to an elaborate scheme drawn up by the finance department. Government bonds for a total commutation sum were given to each person, to be paid off yearly, by lot, to a certain amount, and bearing in the meantime interest varying from 5 to 7 per cent., due every half year. In course of time, therefore, the Government will be entirely relieved from its heavy responsibility in this respect. Amongst other reforms, the wearing of swords by the *samurai* was also, about this time, prohibited by public edict. This, as might have been foreseen, occasioned considerable dissatisfaction for a while, especially in the southern provinces of Satsuma and Tosa; but, as it had been wisely prepared for, some time before, by a notification making the carrying of these weapons optional, large numbers of the military class had already discarded them ere the second notice was issued, and the task was thus rendered far more easy of accomplishment. An exception was, however, made in the case of officers and men of the newly-organized army and navy. These two branches of the public service are now on a fixed system, formed on the model of those adopted by Western nations; and large numbers of foreign instructors have been from time to time employed by the Japanese Government.

Numerous departments or bureaus now exist for the direction of public affairs, the principal being those for home affairs, finance, public works, foreign affairs, war, admiralty, education, justice, and police. Many of these are subdivided into several sections, varying considerably in number according to circumstances. The whole constitution is avowedly modelled after the Western systems.

There does not as yet exist any house of parliament, but already the seeds have been sown from which it may rise at some future day. A chief council, termed the *genrôin* or "senate," exists, and throughout the whole country are found numerous "assemblies," the members of which are elected by vote. These assemblies, however, do not possess any share in the administration; their functions are as a rule very limited, and the subjects discussed by them are chiefly matters relating to roads, drainage, bridges, and other local affairs of but minor importance. The local prefects also meet at intervals to discuss various points of local interest. There are not wanting indications that the establishment of a parliament, like that of England, would be welcomed with joy by a very large proportion of the people. The press is under the supervision of the Government officials in each district, and many restrictions are imposed upon any excess of freedom of speech in the newspapers. The editors have in many instances been subjected to fine or imprisonment for having permitted the publication of certain articles that proved distasteful to the Government. The press laws under which these punishments were awarded were issued in 1875.

Population.

Population.—The number of inhabitants in Japan was until lately very uncertain. To the ordinary traveller it would seem to be very dense, as the roadways are lined with villages; but in the wilder regions the population is widely scattered, and indeed in certain localities not a single dwelling-house is to be seen for miles together. Dr. Kaempfer's ideas on the subject may be taken as rather exaggerated, for it must be remembered that they were derived merely from that portion of the country traversed by him in his journeys from Nagasaki to Yedo. As he visited on his route the large city of Ôzaka, and as he then passed along the Tôkaidô—the most populous and frequented of all the roads throughout the whole empire—it is easy to understand that his theory as to the enormous population was based upon a very deceptive impression. The total has been generally asserted by the Japanese themselves to be about 30,000,000, the authority being a census made so far back as in 1804. A return compiled, in 1875, however, put the exact total at 33,997,449; and the still later census of 1880 gave it as 34,338,404, of whom 17,419,785 were males and 16,918,619 females. The population of the city of Tôkiô is variously stated, but is probably not much over 800,000. According to a computation made in the year 1870, Kiôto had then about 370,000 inhabitants. Next in importance after these two cities comes Ôzaka, with a population of 414,000 souls. After Ôzaka may be mentioned Nagoya, the chief town of the province of Owari, followed closely by Hiroshima in Aki, Saga in Hizen, Kagoshima in Satsuma, Kanazawa in Kaga, and Himéji in Harima,—most of which are said to possess over 100,000 inhabitants. Fukui in Echizen and Gifu in Mino rank in the second class. Of the ports open to foreign trade, Ôzaka being excluded, Nagasaki is said to have the largest population, being very slightly in excess of Yokohama; Hakodaté and Niigata have perhaps about 30,000 each. The foreign communities are very small; they may be numbered at a few hundreds at Yokohama, Tôkiô, Kôbé, and Nagasaki, while at Ôzaka, Hakodaté, and Niigate the European residents may be reckoned by tens.[1]

National wealth.

National Wealth.—Although possessed of considerable mineral wealth, Japan cannot be called a rich country. The early foreign residents, from the time the treaties were made in 1858 and following years, were perhaps over-sanguine in their expectations. Recent commercial returns show that the balance of trade has been against Japan, her exports being considerably in arrear of the imports.[2] Up to the present time this deficiency has been chiefly supplied by an export of bullion, paper money being issued in large quantities for use in the country itself. The value of the notes now in circulation is very great, and it is hard to say how or when they can be redeemed. The notes issued at the time of the revolution of 1868 bore an endorsement to the effect that they were to be redeemed within thirteen years; but, instead of this, they have been replaced by another issue, without any such endorsement. In 1879–80 the Japanese paper currency fell to a discount of above 50 per cent. as compared with the silver Mexican dollar in use amongst the foreign merchants.

---

[1] According to an official report published in 1880 there are in Japan 108 towns with 10,000 inhabitants and upwards.

[2] The consular trade reports for the open ports in Japan, published yearly in the blue books, afford minute information on all subjects connected with commerce between Japan and other nations.

Public works.

Public Works.—In spite of these financial difficulties, the Japanese have made great advances in public works. In the number of its lighthouses Japan may compare favorably with many a Western nation. Though all have been erected by foreign engineers during the past ten or twelve years, there is hardly a promontory or island lying in the direct track of the shipping but is possessed of a lighthouse. Many of the lights are very powerful; but in localities of less importance, or lying off the track of foreign vessels, smaller junk lights are used. Buoys and beacons of various sizes have been moored in many places. The whole system is under the superintendence of a special Government bureau (the lighthouse department), which despatches steamers at stated periods to make the tour of the coast and convey stores and provisions to the different posts. At the more important lighthouses foreign lightkeepers are employed, but in many instances the service is performed by natives alone. The rocky and dangerous character of the Japanese coasts makes this system one of peculiar utility. As already mentioned, good progress is being made in railway construction. Numerous lines of telegraph have been erected throughout the country, not only between the treaty ports but also in the interior, particularly to the garrison towns and local Government offices. The mint at Ôzaka has been working since the year 1871. At Yokosuka, on the western shore of the Bay of Yedo, are a dockyard and arsenal, superintended by French engineers; these have proved of great utility. Large numbers of foreign men of war and other vessels have there been docked and repaired. Paper-mills have been established in different localities, and manufactories of various descriptions started. The postal system is exceedingly well managed, and extends over the whole empire. Attention is also given to custom-house arrangements at the open ports. In the capital there are numerous colleges and Government schools, notably for military, naval, and scientific instruction, conducted in many instances by foreign teachers. The mail service along the coast deserves special mention. The steamers employed belong chiefly to the Japanese steamship company known as the Mitsubishi Company; these ply along the entire length of the coast and also to Shanghai, passing through the "Inland Sea," and smaller boats run to Newchwang in China, and to the Riukiu islands. The company is subsidized by the Government.

Religion.

Religion.—The religious beliefs of the Japanese people may be divided under two heads, the *Shintô* and the Buddhist. By the former is meant the religious belief of the natives prior to the introduction from abroad of Buddhism and the Confucian philosophy.

Shintô.

Shintô means literally "the way of the gods." Though often styled by foreign writers a religion, it really is not one. No concise definition of it appears to exist, but the following are some of its leading points.[1] It contains no moral code, the writer Motoori (a high authority on this subject, born 1730, died 1801) even asserting that in Japan there was no necessity for any system of morals, as every Japanese acted aright if he only consulted his own heart. He also declared that the whole duty of a good Japanese consisted in obeying implicitly and without question the commands of the *mikado*. In *Shintô* Japan is held to be the country of the gods, and the *mikado* to be the direct descendant and actual representative of the Sun goddess. In it there also seems to be mixed up a system of hero worship, many renowned warriors and other personages of ancient days being exalted into what we should term demigods; thus it inculcates a reverential feeling towards the dead. By it, too, spiritual agencies are attributed to the elements or natural phenomena. The *Shintô* shrines throughout the country are built in very simple style, being generally constructed of white wood, unadorned by brilliant coloring as in Buddhist temples, and roofed with thatch. Before each shrine stand one or more *torii*, archways formed of two upright posts with a projecting cross-bar laid on their summits, beneath which is a smaller horizontal beam, the ends of which do not project. As its name implies, the *torii* was originally a perch for the fowls offered to the gods, not as food, but to give warning of daybreak. This archway gradually assumed the character of a general symbol of *Shintô*, and the number which might be erected in honor of a deity became practically unlimited. The special peculiarity distinguishing the pure *Shintô* shrines from the Buddhist temples is the absence of images exposed as objects for the veneration of the worshipper; but at the same time the former nearly always contain some object in which the spirit of the deity therein enshrined is supposed to reside. The principal *Shintô* shrines are those in the department of Watarai in the province of Isé, known as *Isé Dai-jin-gu* ("the great divine palaces of Isé"), and maintained by Government.

Buddhism.

The first Buddhist images and Sûtras were brought to Japan from Corea in the year 552, if we can believe the *Nihongi*; but it was long before the religion obtained much hold on the people. In the beginning of the 9th century the priest Kûkai (now better known as Kôbô Daishi) compounded out of Buddhism, Confucianism, and *Shintô* a system of doctrine called *Riôbu Shintô*, the most prominent characteristic of which was the theory that *Shintô* deities were nothing more than transmigrations of Buddhist divinities. Buddhism, thus fairly introduced, ere long obtained complete ascendency; it became the religion of the whole nation, and held that position until the Tokugawa dynasty of *shôgun*, when it was supplanted in the intellects of the educated class by the philosophy of Choo He. Its teachings were calculated to awaken man to a sense of his own shortcomings and to cause him to long for perfection; it encouraged belief in a succession of lives and transmigration of souls; and the highest reward promised to the true believer was to be absorbed into Buddha and to attain to absolute perfection. Under the Tokugawa family, many grants were made from their treasuries to famous Buddhist temples, notably to that of Zôjôji in the district of Shiba, in Yedo, which was endowed by Iyéyasu himself in the concluding years of the 16th century. These grants were, however, withdrawn after the restoration of the *mikado* in 1868, and Buddhism has been virtually disestablished since 1st January, 1874. Many temples are still kept up, but these are maintained by voluntary contributions from the people and from former patrons.

Since the admission of foreigners into Japan, various Christian missions have been established, principally in Tôkiô and Yokohama, and a tolerably large number of missionaries reside in different parts of the country. Churches have been built, and schools opened for the instruction of children. Christianity is no longer prohibited, as of old, by Government edict, and the number of the native converts is said to be increasing.[2]

HISTORY.

Early legends.

The ancient history of Japan, as recorded in the native annals, is so completely enshrouded in mythological legend as to be absolutely untrustworthy. In these legends numerous deities play a conspicuous part, the country itself being styled the "land of the gods," and the pedigree of the sovereign traced back to *Tenshô Daijin*, the "Sun goddess." It is asserted that there first existed seven generations of "heavenly deities," who were followed by five generations of "earthly deities," who in turn were succeeded by the mortal sovereigns, of whom the present *mikado* or emperor is the 122d. The earliest date accepted amongst the Japanese themselves corresponds to 660 B. C., when the first emperor (Jimmu) succeeded to the throne. The present year (1881) is thus the 2541st year of the Japanese era. The long line of sovereigns comprises one hundred and eleven emperors and eleven reigning empresses. A strong ground for disbelieving the accuracy of ancient Japanese chronology, even after 660 B. C. is the extraordinary longevity assigned by it to the early *mikados.* Of the fifteen emperors from Jimmu onwards, eleven are said to have lived considerably over one hundred years; one of them, Suinin, reached the age of one hundred and forty-one years, while his successor Keikô attained to one hundred and forty-three. After the year 399 A. D., however, these wonderful assertions are no longer made. From the commencement of the 10th century the Japanese annals are more to be trusted, and, although many discrepancies no doubt exist, still the events recorded are generally accepted as authentic.[1]

---

[1] See also Dr. Magel's papers on "Les Religions du Japon," in the *Annales de l'extrême Orient*, 1878–1879.

[2] On July 1, 1878, the nine American and six British Protestant missions in Japan had 104 missionaries (77 American), 26 churches, 113 chapels, etc., 1617 church members, 3 theological schools, 173 students, 9 ordained preachers, 93 assistant preachers, besides many largely attended schools for children. The Roman Catholic and the Greek Church claim many converts also.

Origin of the Japanese.

The precise origin of the Japanese race is by no means easy to determine, and it would seem probable that it is an amalgamation of several different races. The present Aino tribes of the island of Yezo are supposed to be the descendants of the ancient aborigines of the empire. These aborigines, or "savages," as Japanese historians are wont to style them, were at first spread over by far the greater portion of the country, but were gradually driven towards the north by an opposing race who advanced from the southwest.[2] This latter race, the ancestors of the present true Japanese people, are by some writers supposed to have been of Chinese origin; and Japanese annals certainly make mention of such a colony as founded during the reign of the seventh emperor, Kôrei (290–215 B. C.). It is, however, beyond all doubt that the Malay tribes are also represented in the Japanese people, and history further notes an invasion by "black savages," which would seem to point to the natives of Papua or New Guinea. From the relative positions of Japan and Corea, too, it seems probable that some of the inhabitants of the latter place may also have crossed the narrow seas dividing them from Tsushima and the main island of Japan. Ethnologists are not unanimous in their opinions on these points, but it is generally conceded that there did exist an ancient indigenous race, who were subsequently subjugated and driven towards the north by certain tribes advancing from the southwest. Thus, in the early history of Japan we find that Kiôto and the provinces immediately around it were occupied by the conquerors, from whom descended the modern Japanese; while the aboriginal tribes were with difficulty restrained and pent up in the eastern and northern regions.

Relation of the mikado and military class.

The *mikado* himself dwelt at Kiôto, with his court. The nobles composing the court were styled *kugé*, and were themselves descended from cadet branches of the imperial family. There was but one sovereign, and to him the whole empire owed allegiance; he lived in extremely simple style both as regards food and dress, and rode out to the chase surrounded by his retainers. But the inroads of the savages on the eastern borders necessitated constant and vigilant measures for their repression. In such expeditions, however, no special class of generals was created; everything was ordered in the name of the *mikado* himself, or in some cases an imperial prince acted as his representative, so that in no instance did the power even appear to pass from the hands of the sovereign. In the Middle Ages, however, the Chinese military system was adopted as a model, and generals were appointed; the able-bodied males in each province were formed into distinct military corps, and men were told off according to the muster rolls to garrison the capital or to guard the frontiers. Expeditions were carefully organized, being placed under a general (*shôgun*), who was assisted by subordinate officers. All weapons of war and other appliances were kept in the military stores, and issued as occasion required; when warlike operations were suspended, the arms were returned to the stores for safe keeping. As time passed on the powerful family of Fujiwara began to exercise the administrative power hereditarily, in virtue of its relationship to the throne by the female side, and it then became the usage that high descent should be the only qualification for office. The rank and title of general were constantly conferred on the two rival clans of *Hei* and *Gen*, or *Taira* and *Minamoto*, as they are also termed. Upon this there first arose the expression "military class," and during the period 770–780 the complete severance of the agricultural class and the soldiery took place. From this time onwards the military domination acquired yearly greater strength, while the power of the *mikado* decreased in proportion. The turbulent common people of the provinces of Ôshiu, Déwa, and the Kuantô were always in the possession of armor and horses, and openly styled themselves "warriors." In the 10th and 11th centuries the clans of Taira and Minamoto increased in warlike power and influence, became deadly rivals, and virtually ruled the whole country, all the inhabitants owning fealty to one or other of the two factions. A terrible civil war ensued, extending from the middle to the end of the 12th century, when the Taira clan was annihilated by its rivals, who thereupon seized the supremacy. They in their turn succumbed and were succeeded by others, down to the last dynasty (that of the Tokugawa family), which existed from 1603 till 1868. All this time the *mikados* were in reality merely puppets swayed at will by the military faction in power at the time; the ancient state of affairs was overthrown, and the sovereign himself was kept almost a prisoner in his palace at Kiôto. In 1868, however, the revolution shattered the might of the then ruling clan of Tokugawa, the restoration of the *mikado* was effected, and the present position of the sovereign is at last almost perfectly similar to what it was in the very ancient times.

Taira and Minamoto clans.

The most interesting portion of Japanese history is that of the rise and fall in the Middle Ages of the warlike families which in turn seized the power and overawed the crown. Of these the Taira clan stands pre-eminent, though much of its history is mixed up with that of its rival, the Minamoto clan. The two came first into notice in the 10th century, and quickly increased in influence and strength. It would appear indeed that the court strove to play off the one against the other, being moved by fear that the power of either might become too great. Thus, if one of the Taira rebelled, the Minamoto were authorized by the emperor to subdue him; while, if any members of the latter clan proved unruly, the Taira were only too glad to obtain an imperial commission to proceed against them. This gave rise to incessant intrigue and frequent bloodshed, ending at last, in the middle of the 12th century, in open warfare. Taira no Kiyomori was at that time the head of his clan; he was a man of unscrupulous character and unbounded ambition, and constantly strove to secure offices at court for himself, his family, and his adherents. In 1156–59 severe fighting took place at the capital between the rival clans, each side striving to obtain possession of the person of the sovereign in order to give some color of right to its actions. In 1159 Kiyomori eventually triumphed, and the sword of the executioner ruthlessly completed the measure of his success in the field. Nearly the whole of the Minamoto chiefs were cut off,—among them being Yoshitomo, the head of the clan. A boy named Yoritomo, the third son of Yoshitomo, was however, spared through the intercession of Kiyomori's step-mother; and Yoshitsuné, also Yoshitomo's son by a concubine, was, with his mother and two brothers, permitted to live. Yoritomo and his half-brother Yoshitsuné were destined eventually to avenge the death of their kinsmen and completely to overthrow the Taira house, but this did not take place till thirty years later. In the meantime Kiyomori's power waxed greater and greater; he was himself appointed *daijô-daijin* ("prime minister"), and he married his daughter to the emperor Takakura, whom, in 1180, he forced to abdicate in favor of the heir-apparent, who was Kiyomori's own grandson. After raising his family to the highest pinnacle of pride and power, Kiyomori died in 1181, and retribution speedily overtook the surviving members of his clan. The once almost annihilated Minamoto clan, headed by Yoritomo, mustered their forces in the Kuantô and other eastern regions for a final attempt to recover their former influence. Marching westwards under the command of Yoshitsuné they started on one grand series of triumphs, terminating (1185) in a crowning victory in a sea-fight off Dannoura, near Shimonoséki, in the province of Chôshiu. The overthrow of the Taira family was complete: the greater number perished in the battle, and many were either drowned or delivered over to the executioner. The emperor himself (Antoku, 82d of his line), then only in the seventh year of his age, was drowned with other members of the imperial house. The Taira supremacy here came to an end, having existed during the reigns of nine emperors.

Taira supremacy.

Minamoto supremacy.

The period of the Minamoto supremacy lasted from this time until the year 1219. Yoritomo was the leading spirit, as his sons Yoriiyé and Sanétomo, who succeeded him in turn, did not in any way attain to special fame. Having secured himself against molestation from the Taira, Yoritomo directed his efforts systematically to the consolidation of his power in the east. Commencing from the Kuantô, he soon overawed the whole of the northern provinces, and also extended what was virtually his dominion to the westward in the direction of Kiôto. Kamakura, a town on the seashore in the province of Sagami, an old seat of the Minamoto family, was made his metropolis. The site of this town faces the sea, and is completely shut in on the rear by a semi-circular ridge of steep hills, through which narrow cuttings or passes lead to the country beyond. Under Yoritomo, Kamakura prospered and increased in size and importance; a large palace was built, barracks were erected, and it became the capital of the east of Japan. In the year 1192 the emperor Takahira (also known as Go-Toba no In) issued a decree creating Yoritomo *Sei-i-tai-shôgun* (literally, "barbarian-subjugating generalissimo"), and dispatched an imperial envoy from Kiôto to Kamakura to invest him with the office.

Shôgunate.

He and each *shôgun* who came after him were thus nominated commanders-in-chief, holding the office by order of and investment from the emperor, to preserve peace and tranquillity on the eastern marches of Japan. This has given rise, in numerous works on Japan published by different authors (Dr. Kaempfer among them), to the common assertion that Japan possessed *two* emperors,—the one "spiritual," residing at Kiôto, and the other "temporal," residing at Kamakura and afterwards at Yedo. This idea, though entirely erroneous, is not unnatural; for, although each successive *shôgun* owned allegiance to the emperor and was invested by the latter, still his own position as supreme head of the military organization of the country and his influence over the powerful territorial nobles made him *de facto* almost the equal of a sovereign in his own right. This condition of affairs continued until the revolution of 1868, when the *shôgun's* power was shattered, the military domination swept away, and the *mikado* reinstated in his early position of supreme authority. Yoritomo's two sons Yoriiyé and Sanétomo were in turn invested with the office of *shôgun;* they both dwelt at Kamakura. In 1219 Sanétomo was killed by Yoriiyé's son, in revenge for the supposed murder of Yoriiyé himself, and, as he died without issue, the main line of the Minamoto family thus came to an end.

Hôjô family.

Upon this commenced the supremacy of the Hôjô family, who had for years been adherents of the Minamotos. The heirs of the latter having failed, the office of *shôgun* was conferred upon different members of the illustrious house of Fujiwara, who all resided at Kamakura. The military administration, however, was invariably in the hands of the Hôjôs, who acted as regents of the *shôgun;* their supremacy lasted from 1225 to 1333, through what are commonly called the "seven generations of the Hôjô family."

Mongol invasions.

The event of principal importance during this period was the repulse of the Mongol invasion, which occurred in the year 1281. Kublai Khan, founder of the Yuen dynasty in China, had for some years back repeatedly sent to demand submission from Japan, but, this being refused, about 10,000 of his troops attacked Tsushima and Oki in 1274. This expedition was repulsed, and some envoys dispatched to Japan in 1275 and also in 1279 were decapitated by the regent, Hôjô no Tokimuné. Exasperated at this defiance, the Mongol chief collected a mighty armament, which was dispatched to Japan in 1281. The numbers of this invading force are by Japanese writers estimated at no less than one hundred thousand Chinese, Mongol, and Corean troops. They descended upon the coast of Kiushiu, where several engagements were fought; eventually a severe storm destroyed and dispersed the fleet, and the Japanese taking advantage of this favorable opportunity vigorously attacked and completely annihilated the invaders, of whom but three are said to have escaped to tell the tale. It is not surprising that no further attempt to conquer Japan should have been made by the Mongols. In 1331, towards the close of the Hôjô supremacy, the succession to the crown was disputed, and from that time until 1392 there existed two courts, known as the northern and the southern; in the latter year, however, the southern dynasty (established at the town of Nara, near Kiôto) handed over the regalia to the emperor Go-Komatsu, who from that time was recognized as the legitimate *mikado*.

Two courts.

During the period of anarchy and civil war that took place in this century, Kamakura was attacked and destroyed, in 1333, by Nitta Yoshisada, head of a family descended from the Minamoto clan. The rule of the Hôjôs was thus terminated, and by 1338 the family had well-nigh disappeared.

During the confusion and disturbance created by the contest between the rival courts, and also throughout the whole of the 15th century, Japan was devastated by fire and sword in civil wars of the most terrible description. Several families endeavored in succession to acquire the supremacy, but none were able to wield it long. The dynasty of *shôgun* (the Ashikaga line), proved bad rulers, and, though the families of Nitta, Uyésugi, and others came prominently into notice, they were unable to pacify the whole empire.

Later Hôjô family.

In the early part of the 16th century what was termed the "later Hôjô" family arose in the Kuantô, and for "four generations" established their chief seat at the town of Odawara, in the province of Sagami, immediately to the east of the Hakoné hills. At this time, too, lived the famous generals Ota Nobunaga and Toyotomi Hidéyoshi. The latter is perhaps best known to Europeans as the Taikô Hidéyoshi, or simply as Taikô-sama, "my lord the Taikô."

Hidéyoshi.

Taikô, it may here be remarked, is not a name (as commonly supposed) but a title, and signifies literally "great lord." Another common error is to speak of Hidéyoshi as the *shôgun*; he never held that office. The 16th century also saw the first persecutions directed against the native Christians; the religion had been introduced by the Portuguese in 1549, when Xavier first came to Japan. In 1586 Ota Nobunaga was assassinated, and the *taikô* succeeded him in the chief military power. In 1590 the family of the "later Hôjô" was overthrown by him, and the town of Odawara taken. Hidéyoshi then bestowed upon his general Tokugawa Iyéyasu the eight provinces of the Kuantô, at the time directing him to take up his residence at Yedo, which was at that period a town of very small importance. Hidéyoshi died in 1594.

Tokugawa dynasty.

The Tokugawa dynasty lasted from the appointment of Iyéyasu to the office of *shôgun* in 1603 until the resignation of the last *shôgun*, Yoshinobu (usually called Keiki), in 1867. This dynasty comprised fifteen generations of the family, and is undoubtedly the most important throughout the whole of Japanese history.

Iyéyasu.

Iyéyasu was a consummate politician as well as a successful general, and to him the powerful territorial nobles (*daimiô*, throughout the whole country speedily submitted, some from motives of personal interest and others under compulsion after a crowning victory obtained over them by the Tokugawa chief at Sékigahara, on the confines of the provinces of Mino and Ômi, in 1600. This famous battle completely established the supremacy of Iyéyasu, and his rule was gladly accepted by the country as putting an end to the scenes of bloodshed and anarchy from which all classes had so severely suffered for well nigh two centuries back. Under this dynasty of *shôgun* Yedo became a large and populous city, as the presence of their court gave a grand impetus to trade and manufactures of all kinds.

Nobles.

The attendants of the *mikado* at Kiôto were the old *kugé*, or court nobles, descended from cadet branches of the imperial line; they were, as a rule, of anything but ample means, yet their rank and prestige received full recognition from all classes. The court of the *shôgun* at Yedo was, on the contrary, mainly composed of men who were more noted for their territorial possessions and influence than for ancient lineage, for skill in warlike accomplishments rather than in literature and art. This court of Yedo was formed from the territorial nobles (*daimiô*), the petty nobility of the Tokugawa clan (called *hatamoto*), and lower attendants, etc., known as *goké-nin*. The *hatamoto* were originally no less than 80,000 in number, and were in fact the soldiers composing the victorious army of Iyéyasu and ennobled by him; they resided continuously in Yedo, very rarely even visiting their country fiefs. The *daimiô*, on the other hand, were forced to attend in Yedo only at certain stated intervals varying considerably in different cases, and spent the rest of their time at their castle-towns in the provinces,—their wives and families remaining behind in Yedo, virtually as hostages for the good behavior of the heads of their respective clans. The feudal system was thus introduced by Iyéyasu, but he was too wary to force his yoke in a precipitate manner upon the great nobles. He gathered around him his own immediate adherents, upon whom he conferred the more important positions of trust (notably in regard to the garrisoning of a *cordon* of minor strongholds around his own castle at Yedo); and as the power of his clan became more and more firmly established he was enabled more effectively to impose terms and restrictions upon the *daimiô*. It was, however, reserved for his grandson Iyémitsu (1623–1650) to complete the system thus inaugurated: by the latter the nobles were treated solely as feudal vassals, and many very stringent regulations for their guidance and direction were put into force. A similar course was adopted by the successors of Iyémitsu, and this system prevailed until the fall of the Tokugawa dynasty in 1868. Under their rule, however, Japan enjoyed the benefit of almost uninterrupted peace for more than two hundred and fifty years; and though the burden imposed by them grew in the end too heavy to be longer borne, it was only cast off after fifteen members of the clan had in turn succeeded to the chieftainship.

Han system.

Instead of being, as of old, one united empire acknowledging as its sovereign the *mikado* alone, Japan was now portioned out into numerous fiefs, in many ways resembling petty kingdoms. Each fief or territory was ruled by a *han* or clan of which the *daimiô* was the chief, assisted by hereditary *karô* or "councillors," and other officials. According to the will of each *daimiô* did the usages and rules to be observed in the respective fiefs differ. Districts actually adjacent to each other might be placed under totally opposite regulations, both as regards taxes and imposts and with respect to the paper money then in circulation. The various *han* issued notes of different denominations, for use in that one district alone, and this was done without the slightest reference to the paper currency of neighboring fiefs. The permission of the *shôgun's* ministers at Yedo had to be obtained for the purpose, but it is beyond all doubt that large quantities of paper money were issued by the *han*, when pressed by want of funds, without any such authority. The chief evil was that these notes were only local currency, and did not pass freely throughout the whole country; thus a person undertaking a long journey might be put to considerable inconvenience as soon as he crossed the boundary of his own clan's territory. The levying of taxes, too, afforded opportunities for frequent abuse of power: in many *han*, it is certain, taxes were collected with due regard to the condition of the peasantry, but in other instances cruel oppression and ruthless extortion were but too prevalent. This, as has already been remarked, was chiefly the case on the estates of the *hatamoto*, who enjoyed a life of ease and pleasure in Yedo, and who cared little or nothing as to the means by which their supplies were wrung from their miserable serfs. Some of the *daimiô* ruled very large territories,—often a whole province or even more; while others, again, owned an estate measuring but a few square miles. The military class, or gentry, who were entitled to wear two swords as a sign of gentle birth, formed the retainers or clansmen of the great nobles, and were recognized as the first of the "four classes" into which the whole population was divided.

The four classes.

These classes were—(1) the military families, commonly known as the *samurai;* (2) the agricultural or farming population; (3) the artisans; and (4) the mercantile or trading class. But, though by this arrangement the peasants were placed immediately after the gentry, their lot was undoubtedly far harder than that of the artisans or traders, seeing that they were at the mercy of any capricious or tyrannical feudal noble who might be made lord over the villages in which they dwelt. There existed a small number of independent yeomen (called *góshi*) who owned no allegiance to any chieftain; but they also were included in the second of the "four classes." The succession to the shôgunate was vested in the head branch of the Tokugawa clan, but, in the event of a direct heir failing, it was determined that the dignity and office should pass to one of the three kindred clans of Mito, Owari, and Kishiu, or, failing these, to one of the three noble families of Tayasu, Shimidzu, and Hitotsubashi. These two lines of kinsmen of the *shôgun's* house were termed the *go-san-ké* and the *go-san-kiô* respectively. The ceremonial of investiture of each *shôgun* by the *mikado* was always kept up, the latter being thus still recognized as the sovereign, although there only remained to him the title without the power. The *shôgun* was, in fact, nothing more nor less than the chief subject of the *mikado*. The chief power and the direction of political affairs were certainly in his hands, but the name of sovereign was never even assumed by him; and in point of actual rank the mighty territorial chieftains were held to be inferior to the poverty-stricken nobles of the *mikado's* court.

Persecutions of Christians.

The earlier period of the Tokugawa supremacy was disgraced by violent persecution of the native Christians. By an edict issued in 1614 by Iyéyasu (who had resigned in 1605 in favor of his son Hidétada, but still continued to exercise administrative functions) Christianity was finally proscribed, a decree of expulsion was directed against the Jesuit missionaries then in Japan, and persecution raged until 1637. In that year the peasantry of a convert district in the province of Hizen, oppressed past endurance by the cruelties to which they were subjected, assembled to the number of 30,000, and fortifying an old feudal castle at the town of Shimabara, declared open defiance to the Government. Iyémitsu, who was then *shôgun* (1623–1650), despatched an army against them, and after a brief but desperate struggle the Christians were all massacred. These stern measures repressed the profession of the religion, but many clung to it in secret, and several prohibitory edicts were issued throughout the 17th and 18th centuries. So lately, indeed, as 1868 these proclamations might still be seen on the public notice-boards in every village throughout the country.

Feuds of nobles.

Although the Tokugawa period was not disturbed by the warlike expeditions or civil conflicts from which Japan had until then suffered, there nevertheless existed considerable cause of uneasiness in the numberless intrigues or petty conspiricies which prevailed among the great *han* and in the families of the feudal nobles. The question of succession to the chieftainship of a clan not unfrequently stirred up strife amongst the retainers, and in many cases the most unscrupulous means were adopted in order to obtain the desired result. Towards the close of the dynasty several conspiracies were set on foot, but these were promptly stamped out. Japan was now in seclusion from the rest of the world, the inhabitants having been forbidden to leave its shores without express permission under pain of heavy punishments; but the direction of the internal affairs of the country was a task that fully occupied the ruling house. The jealousy and private feuds of the *daimiô* increased to such an extent that on several occasions even the sacred precincts of the *shôgun's* palace became the scene of quarrel and bloodshed. The great nobles gradually rebelled more and more against the rule of enforced attendance in Yedo, and became far less disposed to brook the restrictions imposed upon them by a lord who was virtually but one of their own class; while to the peasants the feudal system was in most cases exceedingly distasteful. Reaction against the military domination thus set in, and men's eyes naturally turned towards the renewal of the ancient régime when the *mikado* was the sole sovereign, before whose authority every subject, whether gentle or simple, bowed in submission. These, among other causes, gradually led to the revolution of 1868, by which the *mikado's* power was restored.

Appearance of foreigners.

In the meantime, since 1858, treaties had been made by the *shôgun's* ministers with several of the foreign powers, and the foreign element had thus been introduced into Japanese political affairs. By some writers undue stress has been laid upon this fact, as if the advent of Western nations had been the main cause of the downfall of the Tokugawa supremacy. From an attentive perusal, however, of native works treating of political matters for some time previous, it would appear that such was not the case.

Decay of shôgunate.

The decay of the shôgunate had gradually been going on for years back; the whole system was tottering to its fall, and it is not improbable that even in the total absence of foreigners the revolution would have occurred exactly as it did.

Revolution of 1868.

The *shôgun* was declared a usurper, and the great clans of Satsuma, Chôshiu, and Tosa warmly espoused the cause of the *mikado*. The Tokugawa clan did not present any very determined front, and the struggle was exceedingly brief. Some fighting, did, however, take place in the vicinity of Kiôto, and also at various points around Yedo; but the most severe conflict was the siege of the castle of Wakamatsu, in Ôshiu. This castle was the stronghold of the powerful northern *daimiô* of Aidzu, a partisan of the shôgunate; his troops offered a stout resistance, but the place was eventually taken by the *mikado's* army after a siege of some two months' duration. The *shôgun* himself had resigned in 1867, and this virtually settled the question in favor of the emperor's army, although some desultory fighting occurred both at Yedo and near Hakodaté two years afterwards. In 1869 the official name of Yedo was changed to Tôkiô (the "eastern capital"), and the *mikado* removed thither from Kiôto with his court. The ex-*shôgun* retired to the town of Shidzuoka, in the province of Suruga, where he still lives in retirement, his only title being that of a noble of the empire. The ancient form of government was thus restored, and the feudal system is now a thing of the past.

Foreign relations.

Since this revolution Japan has become tolerably well known to Europeans. Although her relations with foreign countries were never of any very great importance, they nevertheless commenced at an early date. Allusion has already been made to early Chinese and Corean arrivals in Japan. Dr. Kaempfer asserts that in later times young Chinese of good family constantly came to Nagasaki on pleasure excursions. In 201 A.D. the empress Jingô invaded Corea, and gained several victories over the troops that opposed her; and on her return she introduced into Japan the Corean arrangement of geographical division. The Japanese being a maritime nation, it is not surprising that, prior to the edict forbidding them to leave their country, they should have extended their voyages throughout the whole of the Eastern seas. We read of their visiting China, Siam, and India; indeed, at one time there existed a Japanese colony or settlement at Goa. It is also known that vessels sailed from Japan to the western coast of Mexico. The Mongol invasion in 1281 has been already noticed. In the 16th century Europeans approached the shores of Japan. As early as 1542 Portuguese trading vessels began to visit the empire, and a system of trade by means of barter was carried on. Seven years later three Portuguese missionaries, Xavier, Torres, and Fernandez, took passage in one of these merchant ships, and landed at Kagoshima in Satsuma. The island of Hirado, off the coast of Hizen, appears to have been then the rendezvous of trade between the two nations. From that time commercial relations continued until the Portuguese were expelled the country in 1639. A second expedition against Corea was undertaken by the *taikô* Hidéyoshi in 1592; the Japanese troops not being withdrawn till 1598, and it is interesting to note that a number of Coreans were then brought over to Japan, where they practised the art of making pottery. Descendants of these Coreans still occupy a village in the province of Satsuma. Towards the end of the 16th century Spanish vessels visited Japan, and in 1602 an embassy was despatched by Iyéyasu to the Philippines; but the relations between the two nations were never very close. The Dutch first arrived in 1610, and from that date down to the close of the Tokugawa dynasty they enjoyed almost a monopoly of the Japanese trade. They at first settled in the island of Hirado, but afterwards removed to Nagasaki, where they were virtually imprisoned in their factory on the small peninsula of Deshima in the harbor, connected by narrow causeways with the town itself. Dr. Kaempfer's *History of Japan* gives a full and graphic description of the mode of life of the early Dutch settlers; he himself dwelt in Japan during the rule of Tsunayoshi, the fifth *shôgun* of the house of Tokugawa, 1680-1709. The first Englishman who visited the shores of Japan was William Adams, a Kentish man, who came out to the East as pilot to a Dutch vessel. He lived in the city of Yedo for a considerable time in the opening years of the 17th century, during which period he is stated to have frequently been at the court of Iyéyasu. He instructed the Japanese in the art of shipbuilding, and the title of *hatamoto* was conferred upon him. In 1613 Captain Saris succeeded in founding an English factory in Hirado, but it did not exist for any length of time. Finally, in 1854, Commodore Perry's expedition from America took place, when a *quasi* treaty was made between him and the ministers of the shôgunate at Uraga, on the Bay of Yedo; and later in the same year Admiral Stirling concluded a similar negotiation, at Nagasaki, on behalf of Great Britain. In 1858 these treaties were extended, and others were concluded with the Dutch and French, under which the ports of Nagasaki, Hakodaté, and Kanagawa (now known as Yokohama) were thrown open to foreign traders belonging to those nationalities, from the year 1859. Other European powers gradually followed the example, and at the present moment Japan is in treaty with no less than eighteen nations, viz., Austria-Hungary, Belgium, China, Corea, Denmark, France, Germany, Great Britain, Hawaii, Holland Italy, Peru, Portugal, Russia, Spain, Sweden, Switzerland, and the United States. Prior to the recent revolution the foreign treaties were concluded with the ministers of the *shôgun*, at Yedo, under the erroneous impression that he was the emperor of Japan. The title of *taikun* (often misspelt *tycoon*) was then for the first time used; it means literally the "great ruler," and was employed for the occasion by the Tokugawa officials to convey the impression that their chief was in reality the lord paramount. It is, however, worthy of note that even in these earlier treaties the title corresponding to "His Majesty" was never assumed by the *shôgun*. The actual position of this official remained unknown to the foreign envoys until 1868, when the British, Dutch, and French ministers proceeded to Kiôto, and there obtained from the *mikado* his formal ratification of the treaties already concluded with his powerful subject. Since that time all treaties with Western powers are made out in the name of the emperor of Japan. It was thus that the foreigners came prominently into notice at the time of the revolution, with which, however, beyond this they had really no connection.

Taikun.

In 1873-4 Japan sent an expedition against the aboriginal tribes inhabiting the island of Formosa, off the eastern coast of China, to demand satisfaction for the murder, some years before, of certain Japanese subjects who had been shipwrecked on that island. Some skirmishing took place, in which the Japanese gained the advantage. The most important point in the whole matter was the negotiation with China. Formosa is Chinese territory, but the Japanese contended that, if the Chinese Government would not exact reparation from the aboriginal tribes, they would themselves attack the latter. This they did, and, although at one period it appeared highly probable that war would be declared between China and Japan, the matter was eventually settled amicably, China paying a sum as indemnity for the outrages complained of. Towards the end of 1875 a dispute arose with Corea, a Japanese gunboat having been fired on from a shore fort while engaged in surveying operations close by the Corean capital. The gunboat returned the fire, and landed a party of men, who attacked and destroyed the fort and stockades, and seized upon the weapons, etc., found in it. Some diplomatic negotiations ensued, by which the matter was settled peaceably, and on February 27, 1876, a treaty was concluded in Corea, by two Japanese high commissioners despatched for that purpose. Japanese officials and traders now reside in Corea on precisely the same terms as those on which foreigners have dwelt at the open ports in Japan since 1858.

Formosa expedition.

Corean disputes.

It could not, of course, be expected that the numerous reforms and changes introduced by the present Government would all be accepted without murmur by the people. Riots have of late years occurred in different parts of the country among the farming classes; and outbreaks of a yet more serious character have been stirred up among the *shizoku*. The latter took place chiefly in the western provinces, but were soon quelled. The only one of real magnitude was the insurrection in Satsuma, which broke out in the spring of 1877. Excited by various seditious cries, over 10,000 insurgents collected together and marched in a body northwards from Kagoshima. Their avowed object was to make certain representations to the emperor in person. Delaying in their advance to attack the Government garrison stationed in the castle-town of Kumamoto, in Higo, the rebels allowed time for large bodies of troops to be despatched against them from Tôkiô. The scene of action was thus confined to the island of Kiushiu, and after severe fighting, which lasted for several months, the rebels were annihilated, their leaders either dying on the field or committing suicide. This deplorable attempt was, however, useful inasmuch as it proved the strength of the Government; and in view of its complete failure it would seem unlikely that any effort of a similar nature should be made in future. The restoration of the ancient régime has united and strengthened the empire, instead of letting it remain broken up into numberless petty territories, each unlike its neighbors, as was the case under the old feudal system.

Satsuma insurrection.

LANGUAGE.

The Japanese language is by some philologists thought to have an affinity with the Aryan family; but, as the points of resemblance are very slight and the differences exceedingly great, it is evident that if there be any affinity at all, the divergence must have taken place at a period when the common ancestor of the Japanese and Aryan tongues was a language exceedingly rude and undeveloped. Nor has any relationship been clearly established with any other language of Asia. Japanese thus stands, as it were, by itself, and must be regarded as an almost entirely separate tongue.

Japanese may be considered under the two distinct heads of the spoken and the written languages; the former is the ordinary colloquial, and the latter the more classical style, —of late years to a great degree mixed up with Chinese. According to native historians, the study of the Chinese classics was introduced in 285 A.D.; but this assertion may certainly be questioned, and it seems probable that the actual date was considerably later. At the present day, however, the Chinese characters occupy by far the most important place in the Japanese style of writing.

The Japaness *kana*, or syllabary, consists of forty-seven syllables, viz., *i, ro, ha, ni, ho, he, to, chi, ri, nu, ru, wo, wa, ka, yo, ta, re, so, tsu, ne, na, ra, mu, u, i, no, o, ku, ya, ma, ke, fu, ko, ye, te, a, sa, ki, yu, me, mi, shi, ye, hi, mo, se, su,*—to which may be added *n* final. The following modifications of some of these syllables increase the number to seventy-two:—*h* and *f* sometimes become *b* or *p*; *t* may be modified to *d, ts* to *dz, s* to *z, sh* and *ch* to *j*, and *k* to *g*. This change is called in Japanese the *nigori*.

a is pronounced like *a* in *father*.
e " " *ay* " *say*.
i " " *ee* " *meet*.
o " " *o* " *more*.
u " " *oo* " *fool*.

I and *u* are frequently almost inaudible; in such cases they have been written ĭ, ŭ. A final *u*, in particular, is very seldom sounded in full. The distinction between long and short vowels, and single and double consonants, demands careful attention, as the meaning often depends upon it. Long vowels generally represent the contraction of two others; thus *au* or *ou* becomes in sound ô, *ii* becomes î, and so on. The consonants are pronounced as in English, with the exception of *r*, *h*, *f*, *n*, *d*, *t*, and *g*, which differ somewhat from the corresponding English sounds. The true pronunciation of these letters must be learned from the Japanese. In the case of double consonants, both must be sounded.

Katakana and hiragana.

In writing there is a character for each of the forty-seven syllables given above; and each character may be written in either the *katakana* or the *hiragana* style. The former is the "square" hand, consisting in each case of a portion of the particular Chinese character whose sound (to the Japanese ear) is most clearly imitated by the sound of the Japanese syllable in question; the latter is the cursive or "running hand," adapted from the *katakana* characters, and having several varying styles. Except by the lower and uneducated classes, these written syllabaries are seldom used in writing letters, etc., unless as mere terminations to be taken in connection with a Chinese character immediately preceding, as, for instance, to mark the tense of a verb, etc. As in writing the pure Chinese characters, in the letters of the educated class, the "square" and "running" hands are also used, the syllabic characters attached are also, according to circumstances, usually written in the *katakana* or the *hiragana* for the sake of appearance.

Spoken language.

The spoken language may be classified under the heads of noun and particles, pronoun, adjective, verb, adverb, preposition, conjunction, and interjection. There is also a distinct class of numerals.

The nouns have no inflections to distinguish gender, number, or case, but they are preceded or followed by particles which serve these and other purposes. Except in the case of a few common words, no distinction is made between the masculine and the feminine; when necessary, however, there may be used the prefix *o* or *on* for the former, and *me* or *men* for the latter. The neuter has no prefix at all. In general there is no mark of the plural, but whenever necessary the plural idea may be expressed by the addition of *ra*, *gata*, *domo*, *tachi*, or other particles; a few nouns, again, have a kind of plural formed by a repetition of the noun itself. Compound nouns are formed in various ways, the first letter of the second part of such compounds generally changing in sound by the *nigori* already noted.

The personal pronoun does not demand much attention, except as regards that of the second person. Here the word used is different according to the rank or condition of the person or persons addressed. This idea of "honorific" terms is also to be noted in the use of verbs. As a rule, there are three modes of address,—to superiors, to equals and friends, and to inferiors. The plural of personal pronouns is often formed by the addition of the plural particles noticed under the heading of nouns. The personal pronoun is not to be used too frequently in speaking; as a rule, it is not employed by natives except where its omission might cause ambiguity. Possessive pronouns are virtually personal pronouns, with the addition of the possessive particles *no* or *ga*. Demonstrative and interrogative pronouns also exist; by the addition of certain particles to the former, the indefinite pronoun is formed. There are but few reflective pronouns, and the relative pronoun does not exist. To express that idea, however, the verb of the relative clause is put before the word to which the relative pronoun refers.

The adjective may be declined,—the chief part being what may be termed the root, from which (by the addition of certain syllables) various other forms (including the adverb) are obtained. The Japanese adjective has no degrees of comparison, but an idea of comparison can be expressed by the use of certain particles and by turning the sentence in a peculiar way. Many nouns do duty as adjectives, and are often considered such.

The verb has no means of expressing the distinctions of number or person. In the spoken language there are two conjugations of verbs, in each of which there are four principal parts, viz., the root, the base for negative and future forms, the present indicative, and the base for conditional forms. To each of the principal parts of the verb a number of particles or terminations are annexed; and in this way there are produced forms somewhat similar to the moods and tenses of European grammars. There are, however, a few irregular verbs, in the conjugation of which slight differences are to be noticed. The conjunctions and the interjections are but few in number, and do not call for any special remark.[1]

In a sentence the first place is occupied by the nominative case, the second by the objective or other cases, and the last by the verb. The adjective precedes the noun, and the adverb the verb. Prepositions are placed after the nouns to which they refer. Conjunctions and interrogative particles are placed at the end of the clause or sentence to which they belong.

Written language.

The above parts of speech are also to be found in use in the written language. Here, however, there is to be noticed a great difference in the inflections, which are in most cases totally distinct from those used in the ordinary colloquial. Many old expressions and words that have fallen into disuse in conversation are here still retained, and the written language is by far the more classical of the two.[2]

In the writing hand at present in use Chinese characters predominate. In official documents, despatches, etc., the square character is commonly used, generally with *katakana* terminations. In ordinary letter-writing the cursive hand, more or less abbreviated, is employed, being supplemented, when required, by the *hiragana*. The characters, though identical with those used in China, are arranged in different order, so much so that, though the general meaning and sense of a Japanese document might be intelligible to a Chinese, the latter would scarcely be able to give an exact rendering of it. The sounds of the characters are also in most cases entirely different, the Japanese reading them by what is to them the nearest approach to the true Chinese pronunciation. Thus, a final *ng* preceded by a vowel in Chinese is generally rendered in Japanese reading by a long *o*, while an initial *h* is not unfrequently changed into *k*. Of late years, since the restoration, there has come into prominent notice an ever-increasing tendency to introduce into ordinary conversation numerous Chinese words that had in many cases been never heard before that time. This style is, of course, affected chiefly by men of letters and by officials, and several successive editions of small dictionaries containing these newly introduced expressions alone have been published at intervals; the increase in bulk of the last edition as compared with the first is very perceptible. A rather stilted style of address has always found favor with the military and literary class; the personal pronoun of the second person being usually rendered by the word *sensei*, "teacher," or *kimi*, "lord." Intercourse with foreign countries has of late years naturally created a demand for certain words and phrases hitherto unnecessary, and consequently unknown, and these have therefore been freshly coined as it were for the occasion. It is worthy of remark that certain European words have for years back been in such common use as to be now deemed actually Japanese. Among these may be mentioned the following:—

Foreign words.

Pan, bread, derived from the Latin, through the Spanish or Italian.
Kasutera, a kind of sponge-cake, an adaptation from the Spanish (Castile).
Tabako, tobacco.
Dontaku, Sunday, derived from the Dutch.

The English words "minute," "second" (of time), "ton," "electric," etc., are now freely used, the pronunciation being only slightly at fault. Several Malay expressions have also from time to time crept into use; but these are as a rule heard only among the lower classes at the treaty ports.

Dialects.

Although differences of dialect are distinctly apparent in various localities, these are not by any means so marked as is the case in China. As a rule, a man speaking the pure Yedo dialect might travel through nearly the whole of Japan without experiencing any considerable difficulty; his words would generally be fully understood, though he might now and again be unable to catch the true meaning of the answers he received. In the capital a slight *n* sound is given before the consonant *g*, making it almost *ng*; and in the case of an initial *h*, a slight sibilant is plainly perceptible, giving almost the sound of *sh*. The interjection *né* is often heard in the vulgar Yedo dialect; it has no meaning, is little used by men, and serves merely to draw the attention of the person addressed. In the north this *né* is changed to *na*, and in other parts of Japan to *nō*. In most of the northern provinces, and also in the far west, a series of aspirate sounds take almost an initial *f* instead of *h*; it is thus apparent, for instance, why the name of the large island off the coast of Hizen is so often termed *Firando* instead of its true name *Hirado*. A nasal intonation is very noticeable in Ôshiu and other northern districts, particularly in the neighborhood of Sendai, and this is also heard in the Ôzaka dialect. In Ôzaka and its vicinity, too, the Yedo *né* is rendered by the exclamation *sakai;* at Kiôto, as might be expected, many of the older forms of expression prevail. The Satsuma dialect presents, perhaps, the greatest difficulty: the letter *r*, particularly at the commencement of a word, is replaced by a very decided *j*, and there is a strong tendency to clip off final vowels in all words. This dialect possesses, too, many words peculiar to its own province, so much so indeed that a conversation carried on between two Satsuma men is often all but unintelligible to a native of Tôkiô, although the latter might be able to make himself understood by either of the others. In many country districts also a *patois* is used known only to the peasants, and presenting great difficulty to any Japanese of the better class who comes from a different locality. Even in cases where the word or expression itself is identical, a peculiar intonation or pronunciation so completely disguises it as to convey the impression that it is totally different.

[2] The student is referred to the *Grammar of the Japanese Written Language*, by W. G. Aston.

Dictionaries.

Reading and writing are often almost unknown in remote districts, and the abstruse Chinese characters are beyond the knowledge of the ordinary Japanese peasant. Some few of the easier characters are used, and the *kana* supplies the place of the rest; on most of the Government notice boards, etc., and also in the newspapers published for the express benefit of the lower classes, the reading of any Chinese characters used is generally added at the side in *kana*. It is only among the better-educated ranks that the Chinese writing is well understood and in common use. The dictionaries used are arranged after the Chinese style, each character being looked out, according to the number of strokes contained in it, under its proper radical. The list of radicals is the same as in China, and they are always printed in regular index form at the commencement of the dictionary. At the side of each character in the work is placed the Japanese attempt at the rendering of the true Chinese sound, and underneath is given the meaning in Japanese colloquial. There are special dictionaries for the running hand. This style consists of the ordinary cursive hand, which is not as a rule very unlike the square hand, and also of what is termed the "grass" hand, which is very much abbreviated and exceedingly difficult to acquire. Unless the square hand of a particular "grass" character be known, it is often wholly impossible to look it up in a dictionary.

Writing materials and usages.

The pens and ink used in writing are precisely the same as the Chinese; the lines of writing are perpendicular, and are read downwards, commencing with the column to the extreme right of the reader. The beginning of a Japanese book is thus where our volumes end. The paper used for letters is thin, and in rolls, the written part being torn off when the note is finished; for official despatches large ruled sheets of superior paper are now in fashion. The signature of the writer is always placed at the foot of the page, while the name of the person addressed is written near the top, with some honorific title appended to it. Whenever the title of the sovereign occurs in an official document, it is either placed as the first character in a fresh column, or else a small space, generally of size sufficient to contain one character, is left vacant immediately above it. In a letter numerous honorifics are used, and these serve to distinguish the second person; in speaking of himself the writer omits these, and sometimes also writes the characters in a rather smaller hand and slightly towards the side of the column instead of in the centre. This is of course done in affectation of humility, and is a truly Asiatic idea. The honorific expressions applied only to the *mikado* himself would suffice to compose a small glossary; some of these are exceedingly flowery, as, for instance, the "Phœnix Car," the "Dragon Chariot," the "Jewelled Throne," etc.

Aino.

The language of the Aino tribes in the island of Yezo is totally distinct from the pure Japanese tongue. There does not as yet exist any satisfactory dictionary to throw light upon it, and it can now only be regarded as a kind of local *patois*, intelligible to the Ainos alone. Whether this be the descendant of the most ancient form of speech amongst the inhabitants of Japan, it is impossible to conjecture. It does not in sound resemble pure Japanese, being guttural, and spoken in a much lower key.

Riukiu.

The natives of the Riukiu group also possess a language of their own, but this does not differ in any great degree from Japanese. Many of the persons of the better classes speak Japanese with perfect correctness, and it is also stated that the higher officials are acquainted with the court dialect of China. The Riukiu tongue may be described as nothing more than a very strongly marked dialect of Japanese, and in it there are still preserved many words long since obsolete in Japan itself. In writing, the Chinese characters are chiefly used.[1]

LITERATURE.

Literature in Japan has of late years received far more attention and careful study than in ancient times, if we are to judge by the multitude of recently published books as compared with those existing even less than a century ago. The introduction of printing presses with movable type has no doubt been the principal cause of this; wooden blocks were in use far earlier, but it was a work of great labor to prepare them; and, as only a certain number of copies could be struck from them, in the case of any work much sought after the demand very soon exceeded the supply. As many of the old manuscripts have been set up in type and published in the modern style, there is no great difficulty in procuring specimens of the ancient literature.

In the earliest times Kiôto was the principal if not almost the only seat of learning and literature in Japan. Interminable wars and feuds kept the inhabitants of the eastern portion of the empire too fully occupied with military affairs to allow of their being able to engage in more learned and peaceful pursuits, even had they so wished. The court of the *mikado* at Kiôto enjoyed a far more tranquil existence, and the nobles composing that court devoted themselves with zest to literary pursuits. Poetry was by them held in high honor, and received perhaps the greater share of their attention; but the writing of diaries seems also to have been a favorite occupation, and examples of these, still extant, afford a very interesting insight into the mode of life then prevalent at the court and in the neighborhood of Kiôto.

The ancient literature of Japan contains but few works of a popular character. Almost everything then composed that is still extant was written by and for the members of the learned circle around the court, and was thus exclusively adapted to the minds of the well-read and highly educated class. Later on, in the 10th century, when the learned were devoted chiefly to the study of Chinese, the cultivation of the Japanese language was in a great measure abandoned to the ladies of the court. A very large proportion of the best writings of the best age of Japanese literature was the work of women; and the names of numerous poetesses and authoresses are quoted with admiration even at the present time.

Ancient records.

The earliest of the extant Japanese records is a work entitled the *Kojiki*, or "Record of Ancient Matters," commonly asserted to date from the year 711. Prior to that time, in 620 and again in 681, two other works treating of ancient Japanese history are said to have been compiled, but neither has been preserved. The emperor Temmu (673–686 A. D.), according to the preface to the *Kojiki*, resolved to take measures to preserve the true traditions from oblivion, and he therefore had all the records then existing carefully examined, compared, and purged of their faults. Their contents were then committed to memory by a person in the imperial household, named Hiyeda no Are. Before this record could be reduced to writing, the emperor died, and for twenty-five years Are's memory was the sole depository of what afterwards became the *Kojiki*. At the end of this interval the empress Gemmiô (708–715) commanded one of her ministers to write it down from the mouth of Are, and the work was thus completed at the end of the year 711. Soon after this, in 720, another work was completed entitled the *Nihongi*, or "Japanese Record," which is said to have so far superseded the *Kojiki* that the latter was almost forgotten. The *Nihongi*, like the *Kojiki*, appeared during the reign of an empress (Genshô, 715-723), and the yet earlier work of the year 620 was commenced under the auspices of the empress Suiko (593 628); the person called Are is also by some supposed to have been a woman. The *Kojiki* is to a very large extent pure Japanese, while in the *Nihongi* there are to be found numerous traces of direct Chinese influence: the chief object of the one was to preserve the form and spirit of Japanese antiquity, while the other rather fell in with the growing adoption of Chinese ideas. Both works may be described as ancient histories, purporting to commence from the "divine age" and the very origin of all things, and replete with allusions to Japanese cosmogony and legends of antiquity; they are held to be the chief exponents of the *Shintô* faith, or "way of the gods." They formed a basis for many subsequent works of almost similar style, and were the subject of numerous commentaries. Of these latter writings the one demanding special mention is the *Kojiki-den*, an edition of the *Kojiki* with an elaborate commentary by a renowned scholar named Motoori Norinaga, who lived during the 18th century. It was commenced in 1764, but the first part was not completed until 1786; the second was finished in 1792, and the concluding portion in 1796. The printing of this great work was begun in 1789, and concluded in 1822, Motoori himself having died in 1801.[1]

---

[1] The scientific study of Japanese in Europe is of comparatively modern date. The chief names associated with it are Franz von Siebold, J. Hoffman, Léon de Rosny, and Pfizmaier Among Léon de Rosny's works may be mentioned *Introduction à l'étude de la langue japonaise* (1857), *Manuel de la lecture japonaise* (1859), *Recueil de textes japonais* (1863), *Cours de japonais* (1869), *Dictionnaire japonais-français-anglais* (Paris, 1857). Pfizmaier is the author of a Japanese-German-English Dictionary (Vienna, 1851), of a Japanese chrestomathy (Vienna, 1847), *Untersuchungen über den Bau der Aino Sprache* (1852), etc., and has published a variety of critical papers and Japanese texts in the *Sitzungsberichte* of the Vienna Academy. English workers in Japan are E. Satow, Aston, Chamberlain, Alcock, Hepburn.

Later histories.

Foremost among the later Japanese historical works is the *Dainihonshi*, or "History of Great Japan," in two hundred and forty books. This was composed under the direction of one of Iyéyasu's grandsons, the famous second lord of Mito (1622–1700), commonly known as Mito no Kômon sama. This illustrious noble was a noted patron of literature, and collected a vast library by purchasing old books from various temples or shrines and from the people. At the old castle-town of Mito (in the province of Hitachi) there are still pointed out the ruins of this noble's library buildings, situated for greater safety within the castle moat, hard by the palace. Tradition says that among the numerous scholars who aided the lord of Mito in compiling the *Dainihonshi* there were several learned Chinese who had fled to Japan from the tyranny of their Manchu conquerors. This book is the standard history of Japan to the present day, and all subsequent writers on the same subject have taken it as their guide. Of all the succeeding histories the most worthy of note is the *Nihon Guaishi*, or "External History of Japan," by an author named Rai Sanyo (born 1780, died 1832), who also composed several other works, all of them in classical Chinese. The *Guaishi* is the most widely read, and forms the chief source from which Japanese men of education derive their knowledge of the history of their own country. It was first published in 1827, and numbers twenty-two volumes; the author was occupied for no less than twenty years in its composition; and he appends a list of two hundred and fifty-nine Japanese and Chinese works from which he drew his materials. The book treats, in order, of the great families that held supremacy after the commencement of the military domination and the decadence of the *mikado's* authority, and thus introduces the reader to the Taira, Minamoto, Hôjô, Kusunoki, Nitta, Ashikaga, later Hôjô, Takéda, Uyésugi, Môri, Ota, Toyotomi, and Tokugawa houses. Many of these sections are necessarily very short, as they treat of only one or perhaps two generations, but the records of the chief clans are of considerable length. The writer invariably identifies himself with the particular family in each case, and thus the transactions of two or more factions who strove together for the supreme power at certain epochs have to be detailed twice or even thrice, each time from a different point of view and with varied coloring. The whole period thus rehearsed extends from the middle of the 12th century to the beginning of the 18th. Many other historical works exist, written in less learned style, and adapted for popular reading and the instruction of young students. The *Gempei Seisuiki*, or "Record of the Rise and Fall of the *Gen* and *Hei*," is a noteworthy specimen of its class; it treats only of the two rival clans of Minamoto and Taira, and of the deeds and feats of arms performed by the heroes on both sides. Most of these popular histories are illustrated by wood-cuts, in many cases taken from portraits, etc., in ancient scrolls or paintings.

Poetry.

Poetry having always been a favorite study, it is not surprising that there should exist numerous volumes of verses either written or collected by the old court nobles. Of these the most ancient is the *Manyóshiu*, or "Collection of a Myriad Leaves," which dates probably from early in the 8th century. But this work, notwithstanding its great antiquity, is perhaps less familiar to the Japanese than the *Hiakuninshiu*, or "Collection of One Hundred Persons," which appeared considerably later, and includes some pieces written by emperors themselves. This was followed by almost numberless minor volumes of the same kind. Verse-making attained to such favor that it was a usual custom for one of the nobles to invite together several of his friends noted for their scholarship, solely for the purpose of passing away the time in this occupation. The collections thus obtained were either kept in the original manuscript or printed for convenience. The verses were in nearly all cases in the style known as *uta*, which may be described as the purer Japanese ode as opposed to the *shi*, or style of Chinese poetry introduced in later years, and much affected by men of learning. The *uta* usually consists of thirty-one syllables, the arrangement being in what may be called 5 lines, containing 5, 7, 5, 7, and 7 syllables respectively. The meaning is continuous, though there is often a slight break at the end of the third line, what follows being in antithesis to what has gone before, or a fresh simile with identical meaning but a varied expression. Thus if the position of the two portions of the whole *uta* be reversed, the meaning is generally in no way altered. Each *uta* is complete in itself, and expresses one single idea. The Japanese do not possess any great epics, or any didactic poems, though some of their lyrics are happy examples of quaint ways of thought and modes of expression. It is, however, a hard task to translate them into a foreign tongue with any hope of giving an exact rendering of the allusions contained in the original.[2] The *uta* are often inscribed on long strips of variegated paper; and it is even now a common practice when offering a present to send with it a verse composed for the occasion by the donor. Again, even down to very recent times, when a man had determined to commit suicide, or was about to hazard his life in some dangerous enterprise, it was by no means uncommon for him to compose and leave behind him a verse descriptive of his intention and of the motive urging him to the deed. It is stated in Japanese histories that Sanétomo, the third and last *shógun* of the Manamoto house, was so extravagantly fond of poetry that any criminal could escape punishment by offering him a stanza.

Geography.

Probably the largest section of Japanese literature is that treating of the local geography of the country itself. The works on this subject are exceedingly numerous, and include guide-books, itineraries, maps, and plans, notes on celebrated localities, etc. In most cases only one particular province or neighborhood forms the subject of the one book, but as very minute details are usually given, these works are often of considerable length. Every province in Japan possesses many scenes of historic interest, and can boast of ancient temples, monuments, and other memorials of the past (this is especially the case in those lying immediately around Kiôto or Tôkiô); and it is to preserve and hand down the old traditions relating to them that these guides to celebrated localities have been compiled. They have much resemblance to the county histories in England. Although mainly geographical, they contain no inconsiderable store of historical information, which, as a rule, is printed at the head of each section. The traveller can thus ascertain without difficulty the names of the principal villages, rivers, hills, etc., and can decide what temples, shrines, or monuments along his route are worthy of a visit. Inns, ferries, lodging-houses, etc., receive particular attention.

Maps.

The Japanese maps are not, as a whole, very correct; the greater part are struck from wooden blocks, copperplate engraving having been but lately introduced. Many of the sheets are colored. The roads are laid down with some degree of care, and distinctive marks are allotted to the former castle-towns, the post-towns, and the minor villages; the distance from one town to its nearest neighbor is usually added in small characters along the line indicating the road. Very few maps include the whole of the country; most of them show only a few provinces, and some consist of a series of engravings, each plate being devoted to a single province. Plans of all the cities and of the larger towns are easily procured, and these are drawn for the most part very correctly; there are also road-books of the chief highways showing simply the towns, rivers, etc., along the route in question, much used by travellers in the interior.

Art

There are not many works on art, though there have been published several collections of engravings from drawings by famous Japanese painters. Of late years, however, some slight impetus has been given to this branch of literature, and many of the older editions have been reprinted. Some works on ancient pottery and other antiquities have also appeared.

[1] See a most interesting paper entitled "The Revival of Pure Shinto," by E. Satow, in the *Transactions of the Asiatic Society of Japan*, vol. iii., 1874-5.

[2] See the masterly treatise on this subject, entitled *Classical Poetry of the Japanese*, by B. H. Chamberlain, London, 1880.

Drama. The drama does not hold in Japan the position it enjoys in European countries. No classic author such as Shakespeare was ever known, and the pieces represented on the stage are as a rule of a popular character. The style of these plays is often rather stilted, a large number of ancient and almost obsolete words and expressions being used; but the ordinary farces and light pieces are in the every-day colloquial. Theatre-going is a favorite amusement, especially among the lower classes in the larger towns.

Newspapers. The growth of the newspaper press during the past few years deserves special attention. At the period of the recent revolution there existed but one publication that could be properly classed under this head—the so-called "Government Gazette," which was read only by the official class, for whom alone its contents possessed any interest. But since then so many newspapers have come into existence that the list for the whole country now comprises several hundreds. In the chief cities they are issued daily, in country districts every two or three days or only once a week. The Tôkiô papers have the widest circulation, and are forwarded even to the most remote post-towns. Among these the *Nichi-nichi Shimbun* ("Daily News"), the *Chôya Shimbun* ("Court and Country News"), and the *Hôchi Shimbun* ("Information News") are perhaps the best known; the first-named is a semi-official organ. These journals appear on every day except holidays. They are all similar in style: the first page contains Government notifications and a leading article, the second miscellaneous items of information, and the third contributed articles, sometimes of a political but oftener of a popular or satirical character, while the fourth page is devoted to advertisements. The papers are chiefly printed from movable metal type. The style of composition is principally Chinese, interspersed with *kana* at intervals; but the papers published for the express benefit of the very low classes are almost entirely in *kana*, and are in many cases illustrated by rough wood-cuts. Freedom of the press is as yet unknown, and many an editor has been fined or imprisoned for publishing what was deemed by the officials an infraction of the press laws recently notified. These laws are in some respects very stringent, and the newspaper press is in no slight degree trammelled by them. Before a paper is started, a petition requesting the permission of Government must be sent in, and a promise made that if such permission be granted the press laws shall be strictly obeyed. The paper, once it is started, is under the supervision of the local officials, and whatever they may deem to be a contravention of the laws in question is punished by fine, imprisonment, or suspension, or total abolition of the offending journal. It is needless to point out that under this system anything like free and open criticism of the proceedings of Government is well-nigh impossible, although ingenious plans have been contrived, whereby, though keeping within the actual letter of the law, the editor can proclaim his true views on the subject under discussion. A very common method is to draw a satirical picture of Japan under the name of some other country. The bonds imposed by the Government are felt to be galling, and perfect freedom of the press would be hailed with delight by the exceedingly large and influential class interested in the maintenance and publication of this kind of literature.

Novels. Another large section consists of romances or novels, some of considerable length. In many instances the fiction is woven in with a certain degree of historical fact, as, for instance, in following the supposed adventures of some noble's retainer, during one of the campaigns of the mediæval civil wars. In these, as in European works of the same description, the reader is generally introduced to a hero and heroine, whose thrilling adventures are described in graphic terms. Pretty little fairy-tales also abound, and short story-books with small wood-cuts fill every bookstall in the streets. Many of these are entirely written in *kana*, and, the prices being very moderate, they are within the reach of even the lowest classes. Unfortunately, hardly any of these popular works would bear translation into a foreign language. Children's toy books, illustrated with large and gaudy pictures in colors, and representing chiefly the warlike heroes of ancient days or the noted actors of modern times, complete the final section of the very interesting literature of Japan.

(T. M'C.)

ART.

The range of Japanese art, its origin, and its progress, in connection with some of its most characteristic features, cannot fail to interest all true lovers of art, especially as applied to industries and manufactures. In this latter category should be placed all those applications of art "in the vast and diversified region of human life and action," to quote Mr. Gladstone's words, "where a distinct purpose of utility is pursued, and where the instrument employed aspires to an outward form of beauty,"—in which consists "the great mass and substance of the *Kunst-Leben*, the art-life of a people." As it is within these limits that art has taken its chief development in Japan, it is in this respect more especially that some account will be given here of its leading characters and principles.

If art in its application to purposes of utility may be taken as the first stage in all countries towards the higher art more especially appealing to the imaginative and intellectual faculties, the degree of perfection attained by any nation in this first *Kunst-Leben* must be taken into account in judging of their artistic power and capabilities. Viewed in this light, it is not too much to say that no nation in ancient or modern times has been richer in *Art-motifs* and original types than the Japanese. They undoubtedly have the merit of having created one of the few original schools of decorative art handed down to us from past ages,—a school uninfluenced by any foreign admixture, if we except the first rudiments of all their arts and industries, derived in remote periods from their more advanced neighbors the Chinese, but from that time left to native influences and powers of development. A strangely constituted race, unlike even the Chinese, from whom in fact they have descended, voluntarily maintaining an isolated state for a long succession of centuries, the Japanese nation has grown up under the circumstances best adapted to produce originality, and the "insular pride" so natural in their isolated position among a group of islands in the Pacific Ocean. Thus left to themselves, the genius of the race has led them rather to direct their efforts to confer beauty on objects of common utility and materials of the lowest value than to create masterpieces of art to be immured in palaces or only exhibited in museums. The faculty of making common and familiar things tell pleasurably upon the ordinary mind, by little artistic surprises and fresh interpretations of the common aspects of natural objects and scenes, is specially their gift, and a gift as valuable as it is rare. It is from this standpoint that the art of Japan should be viewed for a right appreciation of its claims to admiration, and for the proper application of the lesson it conveys to art-workmen and manufacturers of objects of utility.

Previous to the London International Exhibition of 1862 Japan had been in fact a sealed book to the Western world, save in so far as a small collection of industrial and natural products of the country to be seen at the Hague could afford information. The Portuguese *via* Macao, and later the Dutch traders allowed to occupy a factory at Nagasaki in Japan in the 17th and 18th centuries, were in the habit of shipping a few articles for Europe, of utilitarian rather than ornamental character. These consisted chiefly of dinner services of porcelain made to order after European models—known as "Old Japan,"—with heavy gilding and staring colors, as unlike any native work as can well be imagined. Lacquered cabinets and large coffers or chests of rough workmanship also found their way to Europe. and some of these are still occasionally to be met with in old country houses or curiosity shops, both in England and on the Continent. When the London exhibition, therefore, made its display in the "Japanese court," followed, as this was, by a great exhibition in Paris in 1867 and in Vienna in 1875, the Japanese contributions to which were carefully selected on a large scale by the Japanese Government itself, the rich treasures of art-work came upon Europe as a new revelation in decorative and industrial arts, and have continued since to exercise a strong and abiding influence on all industrial art-work. In London, as in every Continental capital, specimens of Japanese manufacture in great variety speedily followed in the shop windows; and large importations, taking place almost monthly at depôts in London, are speedily bought up to be distributed over the country, and sold in retail. In the International Exhibition of Paris in 1878, the "Japanese court" again presented a matchless collection of perfect workmanship and design in every variety of material. In textile fabrics, such as silks, gauzes, crapes, and embroidery; in bronzes, cloisonnés, champlevé, repoussé, inlaid and damascened work; in art-pottery, faience, and porcelain; and in lacquer and carved wood and ivory,—there was a bewildering variety; but only one opinion prevailed as to the palm of superiority due to them. The inferiority of most of the articles of the same class exhibited in the adjoining "Chinese court," which from its close proximity provoked while it afforded every facility for a close comparison, was very marked. If other test of excellence were needed, it is amply supplied by the flattery of imitation; though the mischief of merely copying Japanese art-work, without any knowledge of the history, religion, popular legends, or the artistic tastes which inspire the workman in Japan, is obvious in the vulgarized reproductions and the incongruous combinations now so common. They may be *Japanesque*, but they are certainly not Japanese in spirit, feeling, or execution. Defects are exaggerated, and excellences are lost sight of altogether.

Art Literature.

Before proceeding with a general survey of the most characteristic features of Japanese art, it may be useful for purposes of reference to give a list of English works that have appeared in recent years on this subject. Mr. John Leighton in the spring of 1863 was the first to draw public attention to the collection of Japanese objects in the exhibition of 1862 and their artistic merit, by a lecture delivered at the Royal Institution, which was afterwards printed. Dr. C. Dresser, in his *Art of Decorative Design*, published his opinion that Japan could "supply the world with the most beautiful domestic articles that we can anywhere procure;" and both in that work and in another entitled *Unity in Variety, as deduced from the Vegetable Kingdom*, he makes particular reference to Japanese decorative work. A series of articles on "Art and Art Industries in Japan," which appeared in the *Art Journal* in 1875-76, were published, with considerable additions, in a single volume in 1878. About the same time two works appeared on the same subject, J. J. Jarves's *Glimpse at the Art of Japan* (1876), and Messrs. Audsley & Bowes's *Keramic Art of Japan* (1875-80). A fourth work entitled *Fugaku Hiyaku-Kei, or a Hundred Views of Fusiyama*, by Hokusai, with introductory and explanatory prefaces from the Japanese, and descriptions of the plates by J. V. Dickins of the Middle Temple, reproduces fac-simile plates of the original collection of this celebrated native artist, and even to the paper and form of the thin volumes is a perfect counterpart of the original work as published in Japan. Lastly, there has appeared a valuable contribution to our materials for an intelligent judgment in Thomas Cutler's *Grammar of Japanese Ornament and Design* (1881). The plates, exceeding sixty in number, are preceded by a carefully written introductory essay, giving a discriminative survey of the chief art-industries and the principles of Japanese ornamentation.

Art in Japan, it has been well observed, "is not, as in Europe, the grafting of one style upon another, and the accumulated knowledge of all the various schools from the remotest antiquity." It has been a growth unaffected by any extraneous influences, self-contained and strictly national, and hence the astonishment and delight created when the art of Japan was first revealed to the outside world. It is in comparing the decorative art of Japan with that of China that we see how far the former has distanced its early Chinese masters, and how thoroughly it has produced a school peculiarly its own. Commenting on its application to ceramic ware, lacquer, bronzes, textile fabrics, etc., Mr. Cutler has well remarked, "If we study the decorative art of the Japanese, we find the essential elements of beauty in design, fitness for the purpose which the object is intended to fulfil, good workmanship, and constructive soundness, which give a value to the commonest article, and some touch of ornament by a skilful hand, together creating a true work of art."

Native school of art.

The school of art due to the native genius of the Japanese as a race is essentially decorative, and, in its application, to a great degree purely industrial. Pictorial art as understood in Europe can hardly be said to have any existence in Japan. Most of their decorative designs consist of natural objects treated in a conventional way. This conventionalism is, however, so perfect and free in its allurements that nature seems to suggest both the motive and the treatment. Though neither botanically nor ornithologically correct, their flowers and their birds show a truth to nature, and a habit of minute observation in the artist, which cannot be too much admired. Every blade of grass, each leaf and feather, has been the object of loving and patient study. It has been rashly assumed by some of the writers on Japanese art that the Japanese do not study from nature. All their work is an emphatic protest against so erroneous a supposition. It is impossible to examine even the inferior kind of work without seeing evidences of minute and faithful study. It can in fact be shown conclusively that the Japanese have derived all their fundamental ideas of symmetry, so different from ours, from a close study of nature and her processes in the attainment of endless variety.

Special features.

It is a special feature in their art that, while often closely and minutely imitating natural objects, such as birds, flowers, and fishes, the especial objects of their predilection and study, they frequently combine the facts of external nature with a conventional mode of treatment better suited to their purpose. During the long apprenticeship the Japanese serve to acquire the power of writing with the brush the thousand complicated characters borrowed from the Chinese, they unconsciously cultivate the habit of minute observation and the power of accurate imitation, and with these a delicacy of touch and freedom of hand which only long practice could give. A hair's breadth deviation of a line or the slight inclination of a dot or an angle is fatal to good caligraphy, both among the Chinese and the Japanese. When they come to use the pencil therefore in drawing, they are possessed of the finest instruments in accuracy of eye and free command of the brush. Whether a Japanese art worker sets himself to copy what he sees before him or to give play to his fancy in combining what he has seen with some ideal in his mind, the result equally shows a perfect facility of execution and easy grace in all the lines.

In their methods of ornamentation the Japanese treat every object flatly, as do their Chinese masters to this day, and this to a certain extent has tended to check any progress in pictorial art, though they have obtained other and very admirable decorative effects. Without being, as Mr. Cutler, in common with some other writers, assumes, ignorant of chiaroscuro, or the play of light and shadow, it is true that they usually, though not invariably, paint in flat tones as on a vase, and so dispense with both. It is not a picture so much as a decoration that they produce, but it is a decoration full of beauty in its harmonized tints and graceful freedom of design. The delicacy of touch is everywhere seen, whether bird or leaf or flower or all combined be chosen as the subject. The Japanese artist especially excels in conveying an idea of motion in the swift flight of birds and gliding movements of fishes, one of the most difficult triumphs of art.

It has been said that the golden age of Japanese art is over and gone, and that the conditions no longer exist, and can never be renewed, under which it has developed its most characteristic excellences. A feudal state, in which the artist and the workman were generally one and the same person, or at least in the same feudal relation to a chief who was bound to support them working or idle, and took pride in counting among his subjects or serfs those who could most excel in producing objects of great beauty and artistic value, is a condition as little likely to return in Japan as the former isolation and freedom from all foreign influences of the people. Under these altered circumstances it is to be feared that Japanese art has culminated, and shown the best of which it is capable. But if the hour of decadence has arrived, and a deterioration of taste inevitably set in, by an intermixture of foreign and debasing influences overlying original thought and *motifs*, and leading to imitations of European vulgarities, we have the more reason to be grateful to those who, like Messrs. Bowes & Audsley and Mr. Cutler, have undertaken to preserve by costly and faithful examples works produced in the most brilliant period in the life of a singularly gifted people. One of the characteristic features of all Japanese art is individuality of character in the treatment, by which the absence of all uniformity and monotony or sameness is secured. Repetition without any variation is abhorrent to every Japanese. He will not tolerate the stagnation and tedium of a dull uniformity by mechanical reproduction. His temperament will not let him endure the labor of always producing the same pattern. Hence the repetition of two articles the exact copy of each other, and, generally, the diametrical division of any space into equal parts, are instinctively avoided,—as nature avoids the production of any two plants, or even any two leaves of the same tree, which in all points shall be exactly alike. The application of this principle in the same free spirit is the secret of much of the originality and the excellence of the art of Japan. Its artists and artisans alike aim at symmetry, not by an equal division of parts as we do, but rather by a certain balance of corresponding parts, each different from the other, and not numerically even, with an effect of variety and freedom from formality. They seek it in fact, as nature attains the same end. If we take for instance the skins of animals that are striped or spotted, we have the best possible illustration of nature's methods in this direction. Examining the tiger or the leopard, in all the beauty of their symmetrical adornment, we do not see in any one example an exact repetition of the same lines or spots on each side of the mesial line of the spine. They seem to be alike, and yet are all different. The line of division along the spine, it will be observed, is not perfectly continuous or defined, but in part suggested; and each radiating stripe on either side is full of variety—in size, direction, and to some extent in color and depth of shade. Thus nature works, and so following in her footsteps works the Japanese artist. The same law prevailing in all nature's creation, in the plumage of birds, the painting of butterflies' wings, the marking of shells, and in all the infinite variety and beauty of the floral kingdom, the lesson is constantly renewed to the observant eye.

Among flowers the whole family of orchids, with all their fantastic extravagance and mimic imitations of birds and insects, is especially prolific in examples of symmetrical effects without any repetition of similar parts or divisions into even numbers. We may take any one of this class almost at random for a perfect illustration. The *Oncidium leucochilum* is by no means the most eccentric or *baroque* member of the family of orchids. But in its uneven number of similar parts, and the variety in form and color by which a symmetrical whole is produced, there is nothing left to be desired. The sepals are nearly alike, but not quite, either in size, shape, or color-marking. These are balanced, not by three, but by two petals, which match each other, but are broader and more ovate in shape than the sepals, and, instead of being barred and spotted like the sepals, they are broadly painted to about half their length with a deep chestnut color; and, while the lip rising from the centre is pure white and wholly different in form, texture, and color, the crest rising from the base with tubercles is yellowish, with patches of reddish-brown.

This assemblage of parts so diverse in form, number, and color, nevertheless forms a single flower of exceeding beauty and symmetry, affording the strongest contrasts and the greatest variety imaginable, such as delight the Japanese artist's mind. The orchids may be taken as offering fair types of his ideal in all art work. And thus, close student of nature's processes, methods, and effects as the Japanese art workman is, he ever seeks to produce humble replicas from his only art master. Thus may we understand how he proceeds in all his decorative work, avoiding studiously the exact repetition of any lines and spaces, and all diametrical divisions, or, if these be forced upon him by the shape of the object, exercising the utmost ingenuity to disguise the fact, and train away the eye from observing the weak point, as nature does in like circumstances.

Thus if a lacquer box in the form of a parallelogram is the object, the artists will not divide it in two equal parts by a perpendicular line, but by a diagonal, as offering a more pleasing line and division. If the box be round they will seek to lead the eye away from the naked regularity of the circle by a pattern distracting attention, as, for example, by a zigzag breaking the circular outline, and supported by other ornaments.

A similar feeling is shown by them as colorists, and, though sometimes eccentric and daring in their contrasts, they very seldom produce discords in their chromatic scale. They have undoubtedly a fine sense of color in common with other Eastern races, and a similarly delicate and subtle feeling for harmonious blending of brilliant and sober hues. As a rule they seem to prefer a quiet and refined style, using full but low-toned colors. They know the value of bright colors, however, and how best to utilize them cleverly, both supporting and contrasting them with their secondaries and complementaries, as Mr. Leighton remarks.

Having thus taken a very rapid glance at some of the leading features of Japanese decorative art as a whole, and traced the principles that underlie and in great degree determine the processes by which the workman seeks to realize his ideal while taking nature's methods for his guide, we must now pass in review the several art-industries in which they have most excelled. The following account of these, though by no means supplying an exhaustive list, may be considered to include the principal industries. Such, however, is the delicacy of touch and skill in manipulation exhibited by Japanese workmen of all kinds that, apart from the general principles applied in all decorative processes, the simplest toy box of wood or papier-maché is apt to be made a work of art, and as a piece of constructive workmanship is not easily rivalled, or in danger of being mistaken for the work of any other than Japanese hands.

Pottery and porcelain.

Pottery and Porcelain.—There has been much discussion as to the source whence the Japanese derived their skill in pottery and porcelain. The general conclusion that, at a remote era, some Corean priests introduced the manufactory of porcelain from China, the country most advanced in civilization in the eastern half of Asia, may be accepted as sufficiently attested. There is evidence that both Chinese and Japanese have since that time borrowed largely from each other, while inventing new forms and processes by their own ingenuity, taste, and skill. Thus differences in treatment and working traditions would become the inheritance of each, giving rise to the very characteristic distinction which may be observed in the present day between Chinese and Japanese porcelain and pottery of all kinds, notwithstanding a certain generic likeness. The discovery of the art of making hard porcelain, the *pâte dure* of the French in contradistinction to the *pâte tendre*, cost European workmen much time and labor, after the first importations of Chinese and Japanese porcelain excited the admiration and envy of Europe; and the secret was never revealed by either Chinese or Japanese to any European.

There are to this day many secrets of these crafts as jealously guarded as ever. The mystery of crackled china, of lace-work translucent porcelain covered with glaze, and of the marvellous egg-shell cups, and the process whereby these are enamelled and covered by a fine woven case of bamboo, as well as the composition and sources of their colors, are still so many secrets to the European manufacturers, although something has been divined or discovered quite lately as to crackle and lace-work porcelain.

The Japanese of late have been much given to lacquering their porcelain, but very often this is not burnt in, and washes off—nor even in the beginning has it much beauty to recommend it. Their enamel painting on this porcelain is in many cases very delicate and beautiful both in design and color,—but perhaps not as a rule equal to the fine specimens of China of the Ming dynasty, or even of the reign of Kanghi, who was a great patron of the arts early in the 18th century. Of the art-pottery and stoneware of Satsuma and Hizen, and indeed of many other provinces in Japan, it may be said that nothing better in the material has ever been produced. The Japanese have no pretension to rank with the classic designs on the Etruscan and Greek vases, because they have never learned to draw the human figure correctly. But in flowers, birds, fishes, and insects the Greeks themselves never approached the perfection of Japanese art, where such objects give a beauty and value often to the very commonest piece of pottery, made with the finger and thumb for the chief tools, and retaining the impress of the skin on the surface.

The great variety of pottery and ceramic ware produced in Japan may most conveniently be arranged under the three heads adopted by Mr. Franks in his useful *Art Handbook for the Collection in the South Kensington Museum*:—(1) common pottery and stoneware; (2) a cream-colored faience, with a glaze often crackled and delicately painted in colors; (3) hard porcelain. The best account perhaps of the very varied substances used by the Japanese in making these wares and forming their porcelain clay is to be found in the report published under the authority of the Japanese commission, *Le Japon à l'Exposition Universelle de* 1878.

Porcelain painted or enamelled with flowers and other designs is largely produced in the province of Hizen in the island of Kiushiu, of which Nagasaki, where there are large manufactories, is a port; but it is also manufactured in a great number of other provinces and districts. The decoration, whether in enamel colors or metals, is laid on after the final burning of the clay or *pâte*, and above the glaze. But the artists often live apart from the factories and independent of them, working at their own homes, and owning, separately or jointly according to circumstances, small ovens, where at a comparatively low temperature they can fix their easily fused enamels. Thus much of the finer egg-shell porcelain used to be sent in the white state to Tôkiô, Hizen, and other places, there to be decorated by artists of local celebrity. But from the Hizen factories also comes a great quantity of low-class porcelain for shipment at Nagasaki, to suit the demand of the European markets. That for the most part is vulgar in taste, made on European models for domestic use, and consists of toilet sets, tea services, jars, trays, etc., coarsely even if elaborately painted, akin to the ware so long received from Canton under similar conditions of deterioration. The colors are bad, with no refined tones. Light greens, red, and blue, all poor in quality, are most common, and have a vulgar and disagreeable effect. This is the result of a demand for cheap articles by tradesmen who have no taste themselves. But Arita, Kiôto, Kaga, Satsuma, and Owari are all centres whence the most characteristic and admired ceramic wares of Japan are obtained. Several varieties of enamelled and painted faience are produced in all, and from Satsuma and Owari, especially the former, the faience is very rich. The delicate tints of the paste, and the better ground which the *pâte tendre* furnishes for the reception of enamel colors compared with the *pâte dure* of the polished porcelain, give a special beauty to all this ware, while the soft creamy-looking crackled glaze adds an additional charm.

There is a kind of terra cotta and pottery or earthenware industry in Japan of which the produce has been largely exported of late years in the form of jars and censers or flower-pots. The objects selected for the decorative part are usually in very high relief and roughly modelled, consisting of flowers, foliage, or animals, but their artistic merit is not great, though as specimens of technical skill and mastery of all the difficulties offered by subject and material they are very remarkable.

Lacquer ware.

Lacquer Ware.—China has given its name to all porcelain in the Western world, as the country whence it was first imported. So has Japan given its name to all lacquer ware, first introduced to the knowledge and admiration of Europe in the 17th century after the discovery of that country. The beauty and excellence of Japanese lacquer ware have never been matched in Europe. Not even in China, where the varnish tree is also indigenous, and the industry may date quite as far back, has equality been ever established. Japan reigns supreme, now as at first, in this, the most beautiful and perfect product of all her skilled labor and artistic power.

The unmatched and apparently unmatchable beauty of Japanese lacquer may be due to many causes. The varnish tree is of several kinds, and the *Urushi* tree growing in Japan (the fruit of which yields the vegetable wax), from which is derived the lacquer varnish, supplies, it is said, a finer gum than any other of the same species. It is extracted from the tree at particular seasons only, by incisions in the bark, and from first to last is subjected to many manipulations and refining processes, conducted with a patient attention and a delicacy such as could with difficulty be secured in any other country,—perhaps not in Europe at any cost. It admits in these processes of various admixtures of coloring matter, and from the first gathering to the last use of it in highly finished work, increasing care as to the dryness or moisture of the atmosphere, the exclusion of every particle of dust, and other conditions is essential. The articles to be lacquered, whether cabinets or boxes of infinite variety in size and form, are generally made of light fine-grained pine wood, very carefully seasoned, and smoothed so that not the slightest inequality of surface or roughness of edge remains. Layer after layer of the lacquer is laid on at stated intervals of days or weeks, and after each step the same smoothing process is repeated, generally with a lump of fine charcoal and the fingers, as the finest and most perfect of polishing instruments. These layers vary in number, according to the intended effect and perfection of the article, and also in relation to the design. Very frequently this is either in basso or alto relievo, in which ivory and agates, coral, or precious stones are inserted, as well as gold and silver in rich profusion. Some of the older and finer pieces of lacquer, which even in the early days of treaty relations in 1859 were rarely in the market, and now are exceedingly scarce in Japan itself, represent the labor of months and even years of the most skilled workmen, who must be artists as well as masters of the manual craft. On these articles they lavish all their art, and enrich them by every kind of decoration.

Fret patterns and diapers.

Fret patterns are in constant use in all Japanese art, sometimes in the form of borders, and more frequently in diapers, which they use with excellent effect on surfaces in filling up and varying the spaces, in combination with floral and other designs. Their love of variety leads them to adopt several different diapers in covering any surface, often enclosing them in irregular-shaped compartments, fitting into each other or detached according to the fancy of the artist and the shape of the object ornamented. The same kind of ornamentation and decorative art is carried out in their woodwork, as may constantly be seen in their cabinets of marquetrie and inlaid boxes. Their predilection for geometrical forms is best to be seen in their great variety of diapers.

Nor must their floral diapers be overlooked, consisting as they do of an almost infinite variety for covering whole surfaces, in which flowers and foliage form the material. In the spaces of decoration as in all else, the Japanese artist studiously avoids uniformity or repetition of exact spacing. He repeats, but with the greatest irregularity possible, to disguise as it were the repetition of what is in effect the same design or pattern. In close connection with the diaper system of ornamentation is that known as powdering, familiar enough in European art; but in Japan, following the principle of irregularity, the decorator avoids any regular distribution of the design adopted. Lastly, there is a style of ornamentation peculiarly Japanese which consists in the use of medallions grouped or scattered over a surface —of various colors and forms—and filled in with different diapers, the whole producing an effect as pleasing as it was novel when first introduced to European eyes. And in this treatment of medallion powdering may best be seen the triumph of this system for the avoidance of uniformity and diametrical division. The medallions being of definite forms, and usually geometrical in outline, the ingenuity displayed in overcoming the difficulty such forms present is very instructive. They are placed either singly or in groups—in the latter case partially overlapping, and of different outlines—in different colors, and filled in with various diapers, the whole being irregularly distributed over the surface in such a way as to avoid diametrical division or uniformity of any kind.

This applies to the finer specimens of the work, where all the principles of surface ornamentation and design adopted by the Japanese may be seen in their greatest perfection. But lacquer is the common ware for domestic use, almost as common as pottery and earthenware are in Europe. Cups and saucers, trays and saké bottles, medicine boxes and dishes, are in the poorest houses; and so excellent is the varnish that neither boiling water nor oil will affect the surface. In the finer and older specimens this hardness increases with age, so that some of them can with difficulty be scratched with pin or needle. The value of such specimens, first introduced into England at the London exhibition of 1862, has now been fully recognized, and the cost of the best and oldest lacquer, always high, has greatly increased of late years. Dr. Dresser mentioned in a recent lecture a box of about six inches square, for which he was asked in Japan £100, and he was told that in Yedo (now Tôkiô) fine specimens were "bringing their weight in gold." In the Paris exhibition of 1878 there was a large lacquer screen of great beauty valued at 65,000 francs. It, however, was modern, and, with all its beauty, was over-priced. The Japanese also, besides applying lacquer with colors on porcelain, possess in rare perfection the art of lacquering on tortoise shell and ivory. On these they present minute figures and landscapes with a mixture of gilding and rich colors, sometimes in relief, at other times engraved and sunk, and in this manner they ornament miniature cabinets, jewel boxes, and other quaintly formed miniature boxes, medicine cases, etc., in a way to defy competition in their marvellous beauty and delicacy of execution.

Metals and bronzes.

Metals and Bronzes.—In all manipulations of metals and amalgams the Japanese are great masters. They not only "are in possession of secret processes unknown to workmen in Europe," by which they produce effects beyond the reach of the latter, but show a mastery of their material in the moulding and designing of their productions which imparts a peculiar freedom and grace to their best work. A lotus leaf and flower and seed-pod they will produce with inimitable fidelity in the subtle curves and undulating lines and surfaces, and in the most minute markings of leaf and flower. So birds and fishes and insects cast in bronze seem instinct with life, so true are they to nature, while at other times the same objects are adopted for a purely conventional mode of treatment. Their inlaying and overlaying of metals, bronze, silver, and steel, more than rival the best productions of the ateliers of Paris or Berlin, and constitute a special art-industry, with some features of finish and excellence not yet attained in Europe.

Shakudô.

Of the metallurgic triumphs of art which the Japanese may justly claim over all competitors, Chinese, Indian, or European, perhaps the greatest is the perfection to which they have brought the designs in "shakudô," an amalgam of which are usually made the brooches or buttons used to fasten their tobacco pouches and pocket-books, or to ornament the handles of their swords. Shakudô is chiefly of iron, relieved by partial overlaying of gold, silver, and bronze. One of the jurors (the late Mr. Hunt) of the London exhibition of 1862, an employer of the highest artistic and mechanical skill in the working of the precious metals, was convinced, as he stated in his report to the commissioners, that "the Japanese were in possession of some means not known in Europe of forming amalgams, and of overlaying one metal on another, and in the most minute and delicate details introducing into the same subject, not covering an inch, silver, gold, bronze, etc., so as to make a variegated picture of divers colors."

Cloisonné work.

Cloisonné, Champlevé, and Repoussé Work.—In the varied applications of the art of enamelling, the Japanese have run their great rivals in cloisonné work very close, although upon the whole the Chinese have the superiority, their coloring being more brilliant and finely toned in harmony, and their work more solid and satisfactory both to the eye and the touch. A dull and sombre tone is generally adopted in Japanese cloisonné work, which much impairs the beauty of their good workmanship in its general effect.

The mode of producing cloisonné work has often been described. It derives its name from the process of building up the design in cells formed by raised septa varying from $\frac{1}{10}$ to $\frac{1}{12}$ of an inch in depth; these labyrinthine cells forming elaborate patterns of flowers, diapers, frets, etc., are soldered on the surface of the vases selected, made generally of copper; and into these cells the enamel of the consistence of oil paints and of the various colors required by the pattern is carefully pressed by a wooden spatula. When complete the piece is placed in a primitive kind of oven or "muffle," where it is fired with a regulated heat until the paste is fused and converted into a vitreous substance, when it is allowed very gradually to cool. This is a process which, however primitively conducted, as most things are both in China and Japan, and with very simple tools and rude contrivances, is nevertheless one which requires to be watched with the greatest care and judgment. Too much heat would injure the colors, and might fuse the septa or the copper foundation, in which case the whole vessel would become misshapen, or clouded in color and otherwise marred and rendered worthless. Apart from the risky nature of the process, the enamel colors are very valuable, and the artistic labor required in the pattern and manipulation is too great to allow cloisonné articles to become otherwise than costly even in China or Japan. And as to their reproduction in Europe, or any rivalry there, M. Christophile of Paris is understood to have devoted much time and money for the attainment of this object, and succeeded in producing some very beautiful specimens which were exhibited at one of the international exhibitions in London; but the production proved too costly to pay as a matter of business. A good deal has been manufactured in China of late years, it is true, to meet a somewhat indiscriminating demand for articles in such great request. That these modern productions should be inferior to the older work, produced in a much more leisurely way, and for temples or palaces rather than for sale in open market, will be readily understood.

The arts of champlevé and repoussé are not unknown to the Japanese, but both are less practised than the other kinds of metal work above described. Of the latter Mr. Mounsey, late secretary of legation in Japan, succeeded in finding and bringing away many very fine specimens in silver.

Carving.

Carving.—A nation showing such artistic power in metals, and in more fictile material, such as clay, could not fail to excel in wood and ivory carving. Perhaps in no department are they better known, owing to the large number of "nitsuké," as the little ivory groups of figures are called, replete with life and humor, that are to be seen in a hundred shops in every capital. These in the days now rapidly passing away used to be employed as buttons, and were as much matters of costly fancy as seals and rings or brooches with us. Whether they take wood or ivory for their material, the result is equally admirable. There are nitsuké and nitsuké, however, as there are artists and artists. Many of the nitsuké that have been imported into Europe in vast quantities of late years are but poor specimens of the Japanese carver's skill, fancy, and invention.

Wall papers.

Wall Papers.—There is a great field for the display of their originality and love of variety in the wall papers, which are much used to ornament their walls and screens. What has already been said of their decorative system and methods of surface ornamentation applies to their wall papers; and the system itself is nowhere so severely tried, because something of mechanical reproduction is unavoidable. Whether stencilled or printed, the design of a single square must of necessity be the same in each. By what force of imagination and ingenuity they disguise the effect of exact repetition, and lead the eye away from noticing the uniformity, can only be realized by inspection of the papers covering the walls of an apartment, and no description could supply a substitute. Suffice it to say that their art-principles triumph, even under this severe trial.

Textile fabrics.

Textile Fabrics and Embroidery.—Of textile fabrics and embroidery, in both of which they have developed an industry peculiarly their own, something of the same kind may be said as of their wall papers. These fabrics have, however, been so familiarized in England by the eager adoption of the best and most novel in female costumes that their chief characteristics must be very generally known. It was the custom in former times for each daimio to have his private looms, for weaving the brocades which he himself and his wife and family required, and also the fabrics of less costly materials for his retainers. The robes manufactured for the court at Kiôto and Yedo were in like manner only to be had from the imperial looms; some of these, a gift from the shôgun on a minister taking leave of his court, were to be seen in the London exhibition of 1862.

But in many of the more common textile fabrics the best evidence perhaps may be found of the artistic feeling of the nation, and the universality of art work. Towels and dusters of the least expensive material often display very choice designs—as do also the Turkish and Syrian fabrics of the same quality. A piece of bamboo, a broken branch of blossoms, or a flight of birds in counter-changed colors, suffices in their hands to produce the most charming effect, in the most perfect taste. Their embroidery has never been excelled in beauty of design, assortment of colors, and perfection of needlework.

This summary of the leading characteristics of Japanese art, and the industries to which it has been applied with such unequalled success, is much too brief to be otherwise than imperfect. The art works and the art thought of a people so truly artistic as the Japanese have proved themselves to be form a subject of wide scope and great complexity. The reports issued by the Japanese commissioners at the great exhibitions held successively in Paris in 1867 and 1878, in Vienna in 1875, and in Philadelphia in 1876; and the report written by direction of the Japanese Government for the South Kensington Museum, and now embodied in the valuable *Art Handbook on Japanese Pottery*, by Mr. A. W. Franks, its editor, afford the best evidence of the extent and variety of art work for which as a nation they have now a world-wide reputation.

It is true, and strange as true, that the Japanese have apparently never sought to overstep the limits of a purely decorative art, and have thus stopped short of the art development of other nations. Whether this limitation may be from some organic defect, or is merely a result of their neglect to study the human figure and master the difficulties of rendering the fine harmony of line and proportion seen in greatest perfection there, it is difficult to determine. Certain it is, they have never advanced so far. They have always been content to treat the human figure in a conventional style, not much in advance of the Egyptian rendering, and quite incompatible with good drawing.

(R. AL.)

Bibliography.—For its knowledge of Japan Europe was for a long time indebted mainly to the members of the Dutch colony; but since the restoration of intercourse between Japan and the Western nations a very extensive literature *de rebus japonicis* has grown up in the chief European languages. The following works are among the more important:—F. Caron, *Beschrijvinge van het machtigh koninckrijke Japan*, Amst., 1649; R. Manley's English version of Caron, London, 1663; A. Montanus, *Gesantschappen . . . aan de Kaisaren van Japan*, Amst., 1669; Kaempfer, *History of Japan*, Lond., 1728, a translation by J. G. Scheuchzer; Titsingh, *Mémoires, etc.*, Paris, 1820; Thunberg, *Voy. au Japan*, Paris, 1795; G. F. Meylan, *Japan voorgesteld in Schetsen*, Amst., 1830; Fischer, *Bijdrage tot de kennis van het Japansche Rijk.*, Amst., 1833; Pistorius, *Bijdrage tot de geschiedenis van Japan*, Amst., 1849; Francis L. Hawks, *Narrative of the American Expedition by Commodore Perry*, New York, 1856; Fraissinet, *Le Japon Contemporain*, Paris, 1857; Lühdorf. *Acht Monate in Japan nach dem Abschluss des Vertrages von Kanagawa*, Bremen, 1857; Cornwallis, *Two Journeys to Japan*, Lond., 1859; Furet, *Lettres à M. Léon de Rosny sur l'archipel japonais et la Tartarie orientale*, Paris, 1860; Vankattendijke, *Uittreksel uit het dagboek van . . . gedurende zijn verblijf in Japan* 1857–1859, Hague, 1860; Heine, *Japan und seine Bewohner*, Leipsic, 1860 (new edition, 1880); De Lynden, *Souvenir du Japon, vues d'après nature*, The Hague, 1860; Léon de Rosny, *La civilisation japonaise*, Paris, 1860; Rob. Fortune, *Yedo and Peking*. Lond., 1863; Alcock, *The Capital of the Tycoon*, Lond., 1863; Lindau, *Un Voy. autour du Japon*, Paris, 1864; Paupe van Meerdewoort, *Vijf jaren in Japan* 1857–63, Leyden, 1867; Leon Pages, *Histoire de la religion Chrétienne au Japon* 1598–1651, Paris, 1867; *The Official Report of the Prussian Novara Exped. in East Asia*, Berlin, 1864, etc; Henry Schliemann, *La Chine et Le Japon*, Paris, 1867; Aimé Humbert, *Le Japon illustré*, Paris, 1870 (English transl., Lond., 1873); Griffis, *The Mikado's Empire*, New York, 1870–1874; Mitford, *Tales of Old Japan*, Lond., 1871; Bayard Taylor, *Japan in Our Day*, New York, 1872; Adams, *History of Japan from the Earliest Times to the Present Day*, Lond., 1874–75; Savio, *Il Giappone al giorno d'oggi*, Milan, 1875; Metchnikoff, *L'Empire japonais*, Geneva, 1878; Le Gendre, *Progressive Japan, a Study of the Political and Social Needs of the Empire*, New York, 1879; I. L. Bird, *Unbeaten Tracks in Japan*, Lond., 1880; Sir Edward J. Reed, *Japan, its History, Traditions, and Religion*, Lond., 1880; J. J. Rein, *Japan nach Reisen und Studien in Auftrage der K. Preuss. Regierung dargestellt*, vol. i., "Natur und Volk des Mikadoreiches," Leipsic, 1881. In Feb., 1881, appeared vol. i. of an elaborate and valuable *Handbook for Travellers in Japan*, by E. Satow and A. G. S. Hawes, arranged on the model of Murray's Handbooks. See further L. Page's *Bibliographie japonaise ou catalogue des ouvrages relatifs au Japon qui ont été publiés depuis le XVe. siècle jusqu' à nos jours*, Paris, 1859; R. Gosche's Japanese Bibliography up to 1862 in *Zeitschrift der Deutschen Morgenl. Gesellsch.* vol. xx., Supplement; and *Bibliotheca japonica, Verzeichniss einer Sammlung japanischer Bücher in 1408 Bänden, Vienna*, 1875. Much interesting information on Japanese matters will be found in *Annales de l'extrême Orient; Mittheil. der Deuschen Ges. für Natur- u. Völkerkunde Ostasiens* (Yokohama and Berlin), as well as in the *Transactions of the Asiatic Society of Japan* and the *Annuaire de la Soc. des Études japonaises, chinoises*, etc., for 1873, etc., published with assistance of Em. Burnouf and other Orientalists of note.

JAPANNING is the art of coating surfaces of metal, wood, etc., with a variety of varnishes, which are dried and hardened on, by means of a high temperature, in stoves or hot chambers, which drying processes constitute the main distinguishing features of the art. The trade owes its name to the fact that it is an imitation of the famous lacquering of Japan, although the latter is prepared with entirely different materials and processes, and is in all respects much more brilliant, durable, and beautiful than any ordinary japan work. Japanning is done in clear transparent varnishes, in black, and in body colors; but black japan is the most characteristic and common style of work. The varnish for black japan consists essentially of pure natural asphaltum with a proportion of gum animé dissolved in linseed oil and thinned with turpentine; but there are numerous receipts given for the varnish, and manufacturers generally conceal the composition of their own preparations. In thin layers such a japan has a rich dark brown color, and only shows a brilliant black in thicker coatings. For fine work, which has to be smoothed and polished, several coats of black are applied in succession, each being separately dried in the stove at a heat which may rise to near 300° Fahr. Body colors consist of a basis of transparent varnish mixed with the special mineral paints of the desired colors or with bronze powders. The transparent varnish used by japanners is a copal varnish which contains less drying oil and more turpentine than is contained in ordinary painter's oil varnish. By japanning a very brilliant polished surface may be secured which is much more durable and less easily affected by heat, moisture, or other influences than any ordinary painted and varnished work. Japanning may be regarded as a process intermediate between ordinary painting and enamelling. It is very extensively applied in the finishing of ordinary ironmongery-goods, and domestic iron work, deed boxes, clock dials, and papier mâché articles. The process is also applied to blocks of slate for making imitation of black and other marbles for chimney pieces, etc., and a modified form of japanning is employed for prepared enamelled, japan, or patent leather.

The beautiful lacquer work of Japan owes its hardness and durable qualities solely to the natural varnish which forms the basis of the lacquer. That varnish is simply an exudation from a tree (*Rhus vernicifera*) cultivated for the sake of this product throughout a wide area in Japan. The varnish is obtained by making incisions in the bark of the tree, from which a mingled clear and milky juice flows abundantly, which on exposure quickly darkens and blackens in color. After resting in tubs for some time the juice becomes thick and viscous, the thicker portions settle at the bottom of the vessel, and from it the thinner top stratum is separated by decanting. Both qualities are strained to free them from impurities, and when ready for use they have a rich brown-black appearance, which, however, in thin layers presents a yellow transparent aspect. This varnish when applied to any object becomes exceedingly hard and unalterable, and with it as a basis all the colored lacquers of Japan are prepared. The black variety of the lacquer is prepared by stirring the crude varnish for a day or two in the open air, by which it becomes a deep brownish black. Towards the completion of the process a quantity of highly ferruginous water, or of an infusion of gall nuts darkened with iron, is mixed with the varnish, and the stirring and exposure are continued till the added water has entirely evaporated, leaving a rich jet black varnish of proper consistence. In preparing the fine qualities of Japanese lacquer, the material receives numerous coats, and between each coating the surface is carefully ground and smoothed. The final coating is highly polished by rubbing, and the manner in which such lacquered work is finished and ornamented presents endless variations. The durability of Japanese lacquer work is such that it can be used for vessels to contain hot tea and other food, and it is even unaffected by highly heated spirituous liquors.

JAPHETH (יֶפֶת), son of Noah. The most natural rendering of Gen. x. 21 is that which makes Shem the elder brother of Japheth, though the opposite view of the passage in the A. V. follows the Hebrew accents. Interpreters are not agreed whether the sacred text regards Japheth as the second or third son of Noah. In Gen. ix. 24 "youngest" is an easier rendering than "younger," but the name of Ham is always placed between those of his brothers. The whole Biblical importance of the sons of Noah is geographical or enthnographical; even in the narrative of Gen. ix. 20–27 the point lies in the blessings assigned to the nations or groups of nations named after each. The distribution of the Japhetic group is sketched in Gen. x. 2–4 from the geographical standpoint of the Levitical narrator, that is, according to the most recent criticism, of the 6th century B.C. The seven sons of Japheth are the nations lying north of the Semitic group or westward across the Mediterranean. The details are in part obscure. Madai certainly means the Medians and Javan the Ionians, but in our passage the latter name is used in an extended sense, not so much for the Greeks proper—a common Eastern usage of the word—as for the inhabitants of the trading ports and coast-lands of the Mediterranean known to Phœnician commerce. Thus Javan includes Elishah (probably Carthage), Tarshish (Tartessus in Spain), Kittim (Cyprus), and Dodanim, for which we must rather read Rodanim (Rhodes), with the LXX. in our passage and the Hebrew of 1 Chron. i. 7. Tubal and Meshech appear in Ezek. xxvii. 13 as associated with Javan in exporting slaves and bronze to Tyre, and the same nations along with Gomer occur in Ezek. xxxviii. in the great army of Magog which issues from the "extreme north" (A. V. "north quarters," vv. 6, 15). Magog in fact means the Scythians, and whatever doubt there may be as to the identification of the associated names (Gomer, Cimmerians or Cappadocians, with the subdivisions Ascanians, Paphlagonians, and perhaps Teuthranians; Tubal, Tibareni; Meshech, Moschi), the whole group appears to be connected with the shores of the Black Sea or to be known from Phœnician voyages in that direction. The seventh son Tiras is quite unidentified; Thracians and Tyrsenians are mere guesses. The wide range of the Japhetic lands sufficiently explains the blessing in Gen. ix. 27, "May God enlarge Japheth." In the succeeding clause, "and let him dwell in the tents of Shem," it is disputed whether the subject is God or Japheth. In the latter case the allusion must be to friendly intercommunication and common settlements on equal terms, in contrast to the position of the subjugated Hamites (Canaan) under the lordship of the victorious Semites (Israel). The precise point of view from which the northern nations, and particularly those over the sea (Gen. x. 5), came to be grouped as sons of Japheth is the more obscure because the etymology of the name is quite uncertain. The resemblance in sound to the Greek Iapetos has been often noticed, but leads to nothing.

Compare, in addition to Bochart's *Phaleg et Canaan* and the commentaries on Genesis, Knobel, *Völkeriafel*, Giessen, 1850; Kiepert in *Monatsber. der Berl. Ac. d. Wiss.*, February 1859; Lagarde, *Abhandlungen*, Leipsic, 1866; Stade, *Javan*, Giessen, 1880; Delitzsch, *Wo lag das Paradies*, p. 245 *sq.*, 1881.

JARCHI. See RASHI.

JARNAC, chief town of a canton in the arrondissement of Cognac, in the department of Charente, France, is situated on the right bank of the river Charente, about 8 miles east of Cognac, and 18 miles west of Angoulême. The town is well built; and a handsome avenue, planted with poplar trees, leads to the striking suspension bridge. The church contains an interesting ogival crypt. Brandy, wine, and wine-casks are made in the town. At the battle of Jarnac, fought in 1569 between 26,000 Catholics under the Duc d'Anjou and 15,000 Protestants under Coligny and Condé, the last was treacherously shot after surrendering. A pyramid marks the spot where he fell. In the vicinity of the town are some Roman remains. Jarnac gave name to an old French family, of which the best known member is Gui Chabot, baron de Jarnac (d. *cir.* 1575), who gave rise to the proverbial phrase *coup de Jarnac* by a sudden thrust during a duel. The population in 1876 was 4390.

JAROMIERZ, a town in the department of Königinhof, Bohemia, situated at the junction of the Aupa and Elbe. It possesses a district court, a suspension-bridge, a pretty church, and a hospital, and manufactures beet-root sugar. On June 29, 1866, a skirmish between the Austrians and Prussians took place in the neighborhood. The population in 1869 was 5442.

JARRAH WOOD is the product of a large tree (*Eucalyptus marginata*) found in western Australia, where it is said to be very abundant. The trees grow straight in the stem to a great size, and yield squared timber up to 40 feet in length and 24 inches in diameter. The wood is very hard, heavy (sp. gr. 1010), and close-grained, with a mahogany-red color, and sometimes sufficient "figure" to render it suitable for cabinetmakers' use. The timber possesses several useful characteristics; and great expectations have been formed as to its value for shipbuilding and general constructive purposes. These expectations have not, however, been realized, and the exclusive possession of the tree has not proved that source of wealth to western Australia which was at one time expected. Its greatest merit for shipbuilding and marine purposes is due to the fact that it resists, better than any other timber, the attacks of the *Teredo navalis* and other marine borers, and on land it is equally exempt, in tropical countries, from the ravages of white ants. When felled with the sap at its lowest point and well seasoned, the wood stands exposure in the air, earth, or sea remarkably well, on which account it is in request for railway sleepers, telegraph poles, and piles in the British colonies and India. The wood, however, frequently shows longitudinal blisters, or lacunæ, filled with resin, the same as may be observed in spruce fir timber; and it is deficient in fibre, breaking with a short fracture under comparatively moderate pressure. It has been classed at Lloyd's for shipbuilding purposes in line three, table A, of the registry rules.

JARROW-ON-TYNE, a town and municipal burgh of Durham, is situated on the south bank of the Tyne, 3 miles southwest by west of South Shields, and 7 miles southeast of Newcastle, with which it is connected by rail. The parish church of St. Paul, rebuilt in 1783 and again in 1866, still retains some fragments of the original Saxon edifice founded about 685. Close by are the scattered ruins of the monastery begun by the pious Biscop in 681, and consecrated with the church by Ceolfrid in 685. Within the walls of this monastery the Venerable Bede spent his life from childhood; and his body was at first buried within the church, whither, until it was removed under Edward the Confessor to Durham, it attracted many pilgrims. The other chief buildings are the various chapels, the mechanics' institute, and the hospital. Jarrow Slake is a river bay, 1 mile long by ½ mile broad, in which it is said the fleet of King Egfrid found a station. On its banks are the new Tyne docks, formed at a great expense by the North-Eastern Railway Company. These with the quays and adjacencies cover about 300 acres, of which 50 are water surface with a tidal basin of 10 acres. The erection of the docks gave a great impetus to the trade of Jarrow. In 1877, 4,000,000 tons of coal were shipped thence. Iron shipbuilding (one yard employing 5000 hands), iron-founding, and the manufacture of paper and chemicals are the chief sources of wealth, in addition to coal-mining. In 1875 Jarrow was constituted a municipal borough, with an extent of 851 acres. The population in 1881 was 25,296. Previous to 1875 Jarrow had been a local board district; this had a population in 1871 of 18,115.

JASHAR, Book of. See Hebrew Language and Literature, vol. xi. p. 534.

JASHPUR, a tributary state of Chutiá Nágpur, Bengal, between 22° 17′ 5″ and 23° 15′ 30″ N. lat., and between 83° 32′ 50″ and 84° 26′ 15″ E. long., with an area of 1947 square miles, is bounded on the N. and W. by the tributary state of Sargújá, on the S. by Gángpur and Udáipur, and on the E. by Lohárdagá district. The state of Jashpur consists in almost equal proportions of highland and lowland areas. On its eastern side the tableland of the Uparghát (2200 feet above the sea) forms an integral part of the plateau of Chutiá Nágpur; towards the west it springs abruptly from the Hetghát, with a wall buttressed at places by projecting masses of rock. The lowlands of Hetghát and of Jashpur proper lie to the south in successive steppes, broken by low hills. The plateau of Khuriá (3000–3700 feet) occupies the northwest corner of the state. The principal peaks in Jashpur are Ráníjulá (3527 feet), Kohiar (3393 feet), Bharamurio (3390 feet). The chief river is the Ib, which flows through the state from north to south; but numerous rapids render it unnavigable. The small rivers to the north are feeders of the Kanhar. Iron and gold are found; *sál*, *sisú*, ebony, and other valuable timber trees abound. Lac, *tasar*-silk, and bees-wax, with cereals, oil-seeds, fibres and cotton are produced. Jashpur, with the rest of the Sargújá group of states, was ceded to the British by the provisional engagement concluded with Madhují Bhonslá (Apá Sáhib) in 1818. Although noticed as a separate state, it was at first treated as a fief of Sargújá. It is, however, dealt with as a distinct territory.

The chief of Jashpur's annual income is £2000; the tribute to Government is £77 10s. The total population in 1872 was 66,926, comprising 34,648 males and 32,278 females, —the Dravidian aborigines numbering 40,935; Kolarian aborigines, 14,070; semi-Hinduized aborigines, 6374; Hindus, 5124; Mahometans, 423. The residence of the rájá is at Jagdispur or Jashpurnagar.

JASMIN, Jacques (1798–1864), a noted Gascon poet, was born at Agen, March 6, 1798. His childhood was spent in the midst of privations and all the straits of poverty, and he boasted in after life that he had succeeded in breaking up the traditional chair in which the Jasmins had hitherto been carried to the workhouse in sickness and old age. His father, who was a tailor, had a certain facility for making doggerel verses, which he sang or recited at fairs and such like popular gatherings; and the younger Jasmin, who used generally to accompany him, was thus early familiarized with the double part which he afterwards so successfully filled himself. When sixteen years of age he found employment at a hairdresser's shop, and subsequently started a similar business of his own on the Gravier at Agen. It is opposite this scene of his ripening genius and daily work that a statue has been erected to his memory by public subscription. In 1835 he published his first volume of *Papillotos* ("Curl Papers"), containing poems in French (a language he used with a certain sense of restraint), and in the familiar Agen patois—the popular speech of the working classes—in which he was to achieve all his literary triumphs. Many of the pieces in this volume had already been printed and submitted to the public. The dialect which Jasmin spoke, though still harmonious and full of picturesque idioms, was now almost exclusively used by illiterate persons, and was greatly modified by a daily contact with French. It was, however, his native speech—the one in which he found spontaneous and adequate expression, and he lost no opportunity of making himself complete master of it by intercourse with the rural population in outlying districts where it was spoken with less admixture. He rehabilitated, disencumbered, and in a measure reconstructed his literary medium, and then, fully realizing that his poems needed other exposition than the mere printed text, he began those numerous public recitations which so largely added to his reputation. His real poetic gift, and his flexible voice and action, fitted him admirably for this double rôle of troubadour and jongleur. In 1835 he recited his "Blind Girl of Castel-Cuillé" at Bordeaux, in 1836 at Toulouse; and he met with an enthusiastic reception in both those important cities. Most of his public recitations were given for benevolent purposes,—1,500,000 francs, the proceeds of his poetical rounds, being contributed by him to the restoration of the church of Vergt and other good works. Four successive volumes of *Papillotos* were published during his lifetime, and contained amongst others the following remarkable poems, quoted in order: "The Charivari," "My Recollections" (supplemented after an interval of many years), "The Blind Girl," "Françounetto," "Martha the Simple," and "The Twin Brothers." With the exception of the "Charivari," these are all touching pictures of humble life,—in most cases real episodes,—carefully elaborated by the poet till the graphic descriptions, full of light and color, and the admirably varied and melodious verse, seem too spontaneous and easy to have cost an effort. Jasmin was not a prolific writer, and, in spite of his impetuous nature, would work a long time at one poem, striving to realize every feeling he wished to describe, and give it its most lucid and natural expression. A verse from his spirited poem, "The Third of May," written in honor of Henry IV., and published in the first volume of *Papillotos*, is engraved on the base of the statue erected to that king at Nérac. In 1852 Jasmin's works were crowned by the Académie Française, and a pension was awarded him. The medal struck on the occasion bore the inscription "Au poëte moral et populaire." His title of "Maistre es Jeux" is a distinction only conferred by the academy of Toulouse on illustrious writers. Pius IX. sent him the insignia of a knight of St. Gregory the Great, and he was made chevalier of the legion of honor. He spent the latter years of his life on a small estate which he had bought near Agen and named "Papillotos," and which he describes in *Ma Bigno* ("My Vine"). Though invited to represent his native city, he refused to do so, preferring the pleasures and leisure of a country life, and wisely judging that he was no really eligible candidate for electoral honors. He died October 4, 1864. His last poem, an answer to Renan, was placed between his folded hands in his coffin.

The linguistic and literary revival in the south of France, which received such lustre from the genius of Jasmin, has now become a well-organized movement, and has extended from Gascony to Languedoc, and to Provence, where it is most marked.

JASMINE, or Jessamine, botanically *Jasminum*, a genus of shrubs or climbers constituting the principal part of the natural order *Jasminaceæ*, and comprising about sixty species, of which forty or more occur in the gardens of Britain. The plants of the genus are mostly natives of the warmer regions of the Old World, but there are one or two South American species. The leaves are pinnate or ternate, or sometimes apparently simple, consisting of one leaflet, articulated to the petiole. The flowers, usually white or yellow, are arranged in terminal or axillary panicles, and have a tubular 5- or 8-cleft calyx and a cylindrical corolla-tube, with a spreading limb, two included stamens, and a two-celled ovary.

The name is derived from the Persian *yásmín*. Linnæus obtained a fancied etymology from *ἴα*, violets, and *ὀσμή*, smell, but the odor of its flowers bears no resemblance to that of the violet; it is in fact so peculiar as to be incomparable, and is probably the only floral perfume which cannot be imitated by art. The common white jasmine, *Jasminum officinale*, one of the best known and most highly esteemed of British hardy ligneous climbers, is said to be a native of India, and to have been introduced about the middle of the 16th century. In the centre and south of Europe it is thoroughly acclimatized. Although it grows to the height of 12 and sometimes 20 feet, its stem is feeble and requires support; its leaves are opposite, pinnated, and dark green, the leaflets are in three pairs, with an odd one, and are pointed, the terminal one larger and with a tapering point. The fragrant white flowers bloom from June to October; and, as they are found chiefly on the young shoots, the plant should only be pruned in the autumn. Varieties with golden and silver-edged leaves and one with double flowers are known.

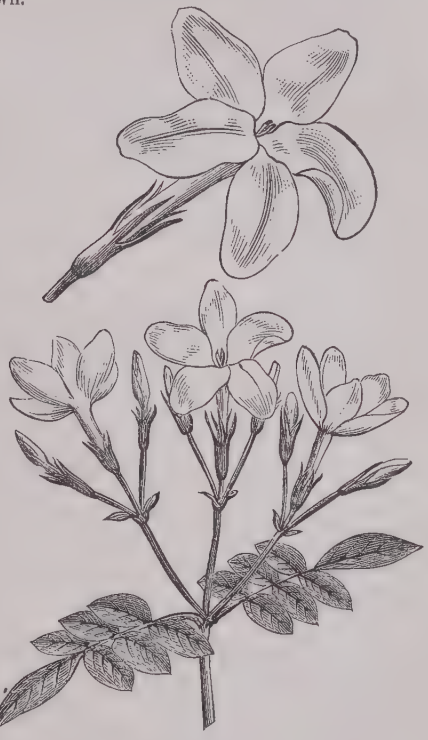

Fig. 1.—*Jasminum grandiflorum*, half nat. size: flower, natural size.

The Zambak or Arabian jasmine, *Jasminum Sambac*, is an evergreen white-flowered climber, 6 or 8 feet high, introduced into Britain in the latter part of the 17th century. Two varieties introduced somewhat later are respectively 3-leaved and double-flowered, and these, as well as that with normal flowers, bloom throughout the greater part of the year. On account of their exquisite fragrance the flowers are highly esteemed in the East, and are frequently referred to by the Persian and Arabian poets. An oil obtained by boiling the leaves is used to anoint the head for complaints of the eye, and an oil obtained from the roots is used medicinally to arrest the secretion of milk. The flowers of one of the double varieties, known as "Moogree," are held sacred to Vishnu, and used as votive offerings in Hindu religious ceremonies. In China the flowers of this plant, under the name of "Mo-le-hwa," are used for scenting tea. The Spanish, or Catalonian jasmine, *J. grandiflorum* (fig. 1), which grows wild on the island of Tobago, is very like *J. officinale*, but differs in the size of the leaflets; the branches are shorter and stouter, and the flowers very much larger, and reddish underneath. By grafting it on two-year-old plants of *J. officinale*, an erect bush about 3 feet high is obtained, requiring no supports. In this way it is very extensively cultivated at Cannes and Grasse, in the south of France; the plants are set in rows, fully exposed to the sun; they come into full bearing the second year after grafting; the blossoms, which are very large and intensely fragrant, are produced from July till the end of October, but those of August and September are the most odoriferous. An acre of land is said to yield about 500 ℔ of blossoms during the season, value £25 to £35. The aroma is extracted by the process known as "enfleurage," *i.e.*, absorption by a fatty body, such as purified lard or olive oil. Square glass trays framed with wood about 3 inches deep are spread over with grease about half an inch thick, in which ridges are made to facilitate absorption, and sprinkled with freshly gathered flowers, which are renewed every morning during the whole time the plant remains in blossom; the trays are piled up in stacks to prevent the evaporation of the aroma; and finally the pomade is scraped off the glass, melted at as low a temperature as possible, and strained. When oil is employed as the absorbent, coarse cotton cloths previously saturated with the finest olive oil are laid on wire-gauze frames, and repeatedly covered in the same manner with fresh flowers; they are then squeezed under a press, yielding what is termed "huile antique au jasmin." 3 ℔ of flowers will perfume 1 ℔ of grease,—this is exhausted by maceration in 1 pint of rectified spirit to form the "extract."

An essential oil is distilled from jasmine in Tunis and Algeria, but its high price prevents its being used to any extent. The East Indian oil of jasmine is a compound largely contaminated with sandal-wood oil. The distinguishing characters of *J. odoratissimum* consist principally in the alternate, obtuse, ternate, and pinnate leaves, the 3-flowered terminal peduncles, and the 5-cleft yellow corolla with obtuse segments. The flowers have the advantage of retaining when dry their natural perfume, which is suggestive of a mixture of jasmine, jonquille, and orange-blossom. In China the *J. paniculatum* is cultivated as an erect shrub, known as *Sieu-hing-hwa;* it is valued for its flowers, which are used with those of *J. sambac*, in the proportion of 10 ℔ of the former to 30 ℔ of the latter, for scenting tea—40 ℔ of the mixture being required for 100 ℔ of tea. The "narrow leaved jasmine," *J. angustifolium*, is a beautiful evergreen climber 10 to 12 feet high, found in the Coromandel forests, and introduced into Britain during the present century. Its leaves are of a bright shining green; its large terminal flowers are white with a faint tinge of red, fragrant, and blooming throughout the year. The bitter root, ground small and mixed with lime-juice and root of *Acorus Calamus*, is considered in India a good remedy for ringworm and herpes. In Cochin China a decoction of the leaves and branches of *J. nervosum* is taken as a blood-purifier; and the bitter leaves of *J. floribundum* (called in Abyssinia "Habbez-zelim") mixed with Kousso is considered a powerful anthelmintic, especially for tape-worm; the leaves and branches are added to some fermented liquors to increase their intoxicating quality. In Sierra Leone a poultice made with the leaves of *J. noctiflorum* is applied to ulcers. The leaves of *J. hirsutum* boiled in oil are applied in India and China in cases of ophthalmia, and its root is said to be a really good remedy for snake bites. In Catalonia and in Turkey the wood of the jasmine is made into long, slender pipe-stems, highly prized by the Moors and Turks. Syrup of jasmine is made by placing in a jar alternate layers of the flowers and sugar, covering the whole with wet cloths and standing it in a cool place; the perfume is absorbed by the sugar, which is converted into a very palatable syrup.

The plant known in America as the "Carolina jasmine" (fig. 2) is not a true jasmine (see GELSEMIUM). Other hardy species commonly cultivated in gardens are the low or Italian yellow-flowered jasmine, *J. humile*, an erect shrub 3 or 4 feet high, with angular branches, alternate and mostly ternate leaves, blossoming from June to September; the common yellow jasmine, *J. fruticans*, a hardy deciduous shrub, 10 to 12 feet high, with weak, slender stems requiring support, and bearing yellow, odorless flowers from spring to autumn; and *J. nudiflorum*, which flowers before the leaves appear. (J. CH. S.)

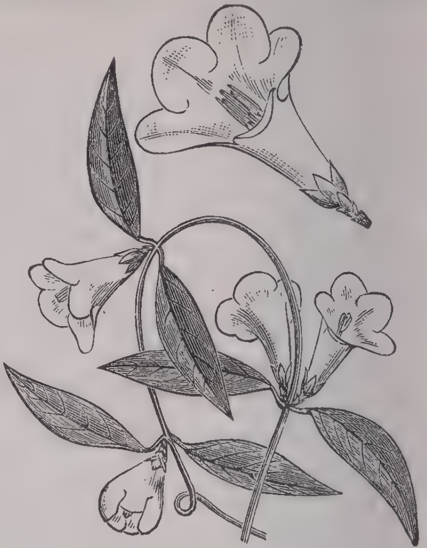

FIG. 2.—*Gelsemium*, half natural size; flower, nat. size.

JASON, grandson of the god Poseidon or of the king Cretheus, is by this descent as by his name (Ἰάσων, Ἴασος, Ἰασίων, etc., can hardly be separated from Ἰάς, Ἰαστί, Ἰαονες, etc., see Curt., *Gr. Gesch.*, i., note 34) connected with the seafaring Ionians and their Poseidon religion. He was the leader of the Argonautic expedition, for the details of which see ARGONAUTS. After he returned from it he lived at Corinth with his wife Medea for many years. At last he put away Medea, in order to marry Glauce, daughter of the Corinthian king Creon. The revenge which Medea took on Jason's new wife and on her own children by him is the subject of Euripides's greatest play. The story of Jason is one of the most famous in Greek mythology, and has run through a long course of development. Stripping off the later embellishments of poetic fancy, we find that the main outlines were not completed till the voyages of the Eubœan mariners to the Hellespont and the Euxine determined the order of the incidents of the outward voyage. Beneath this outward form we find that the scenes of Jason's life are the places where Ionian mariners exerted most influence—the coasts of Thessaly and Bœotia, the Ægean islands, Corinth, and the Adriatic shores; moreover, the Minyæ, who supplied most of the Argo's crew, are closely connected with the old Ionians. The myth therefore was an accompaniment of the religion carried with them by these mariners, and preserves to us the memory of a genuine connection once existing between these widely separate places. We can analyze the legend still further, determining the religious centre round which this historical framework has been constructed; this we shall find to be one of the commonest naturalistic myths. The sun, the ram with the golden fleece, flies through the air to the land at once of setting and of rising sun; there he is sacrificed on the shore in the fire of sunset; his skin is hung upon the tree of the nightly heaven, and guarded by the envious power, the dragon, till it is captured by the solar hero, by whom the darkness is dispelled and the dragon slain.

JASPER, an opaque close-grained variety of quartz, variously tinted, but usually either red or brown,—the color being due in the former case to the presence of peroxide of iron, and in the latter to the same oxide in a hydrated condition. Frequently the color is not uniform, and if the tints be disposed in stripes or bands the mineral is termed *riband jasper*. A brown jasper occurring in nodules, and exhibiting variations of tint arranged in zones, is termed, from its locality, *Egyptian jasper*. Although the term jasper is now restricted to such varieties of quartz as present opacity, it is certain from the descriptions of classical writers that their *jaspis* or *ιασπις* was a stone of considerable translucency. The original jasper appears to have been green, inasmuch as it is often compared with the emerald and other green objects. Probably the jasper of the ancients included stones which we should now class as chalcedony and agate, while our jasper was then known as the *achates*. The emerald-like jasper appears to have been a green chalcedony, like the plasma and chrysoprase of modern mineralogists.

See Rev. C. W. King's *Natural History of Precious Stones*, 1865.

JASSY, JASII, or JASCHI, formerly the capital of the principality of Moldavia, and now the chief town of a district in Roumania, is situated in the valley of the Bachlui (a tributary of the Pruth), in 47° 10′ N. lat. and 27° 30′ E. long., about 200 miles to the north of Bucharest. The surrounding country consists of hill and dale, and the town with its widely scattered houses intermingled with trees occupies two eminences, of which the one has a rapid and the other a very gradual ascent. The exterior aspect of the place is decidedly attractive and imposing; but the character and condition of the interior is disappointing. A large number of the houses are built of wood, the streets are irregular and dirty, and there is no satisfactory drainage. Since 1873, however, the principal streets have been paved with asphalt, etc., by W. O. Callender of London, at a cost to the town of £200,000. Jassy is the residence of a prefect, and the see of the archbishop of Moldavia; and it has a court of the first instance, a court of appeal, a number of synagogues, and about forty-seven Greek churches, including the cathedral and the church of the monastery of St. Spiridion, a museum with a public library, a fine hall, and a theatre. Besides the university (which has three faculties—law, letters, and philosophy—and in 1876 numbered 22 professors and 146 pupils), there are two gymnasia in the town, one academy, several national schools (both girls' and boys'), and upwards of twenty private schools. The foundation of St. Spiridion (due to the liberality of Gregorius Ghika in 1727, and available for the sick of all countries and creeds) has an income of nearly £50,000 per annum, and maintains hospitals in several towns of Moldavia. The main hospital in Jassy is a large building, and possesses a maternity institution, a midwifery school, and other auxiliaries. A society of physicians and naturalists has existed in Jassy since the early part of the century, and a number of periodicals are published in the town. In the vicinity are Belvedere Castle (the residence formerly of Stourza Citacnie), the mineral springs and convent of Galata, the water-cure establishment of Rapide, and the great ecclesiastical college of Socola. The industrial activity of Jassy is but slight,—a tobacco factory, a flour-mill, a brewery, and two or three small manufactories of aerated water making the total sum in 1878. The trade of the town is mainly in the hands of the Jews, who form a large and increasing proportion of its 90,000 inhabitants. By a branch line to Pascani, Jassy communicates with the Austrian railway system, and by a line to Unghani with that of Russia. The town is governed by a mayor and council. Its income is to a considerable extent derived from a tax on the wines.

The inscription by which the existence of a Jassiorum municipium in the time of the Roman empire is sought to be proved lies open to grave suspicion; but the town is mentioned as early as the 14th century, and probably does derive its name from the Jassians, or Jazygians, who accompanied the Cumanian invaders. About 1564 it was made the capital of Moldavia, instead of Suczava, by Alexander Lapusnenu. It was reduced to ashes by Sultan Soliman in 1538, and by Sobieski in 1686. By the peace of Jassy the second Russo-Turkish war was brought to a close in 1792. A Greek insurrection under Ypsilanti in 1821 led to the storming of the town by the Turks in 1822. In 1844 there was a severe conflagration. For the loss caused to the town in 1861 by the removal of the seat of government to Bucharest the constituent assembly voted £148,150, to be paid in ten annual instalments, but no payment has been made.

JÁSZ-BERÉNY, a corporate town of Hungary, and formerly capital of the Jászság (Jazygia) district (since 1876 incorporated with the Cis-Tisian county of Jász-Nagy-Kun-Szolnok), is pleasantly situated on both banks of the Zagyva, crossed there by a stone bridge, and on the Hatvan-Szolnok line of railway, 39 miles east of Budapest, 47° 29′ N. lat., 19° 57′ E. long. It is the seat of a royal court of law and a circuit court, and has several churches, one of which is large and handsome, a Franciscan monastery, a Roman Catholic gymnasium, a high school, a guard house, and an elegant town hall, in which are preserved archives of considerable importance. In the centre of the town the channels of the Zagyva form two islands, which are planted with trees and laid out as promenades. On one of these stands a marble bust erected (1797) in honor of the Palatine Archduke Joseph. Not far from the same place are the ruins of a fortress, where it is popularly believed that Attila, king of the Huns, was buried (453). The inhabitants of the town and neighborhood are much engaged in agricultural pursuits and in pasturing horses, cattle, and sheep on the vast communal lands. Fairs are periodically held in the town, and the trade in field produce, fruit, grain, and cattle is generally brisk. The population at the end of 1880 amounted to 21,781, chiefly Magyars by nationality, and Roman Catholics by creed.

JÁTIVA, or SAN FELIPE DE JÁTIVA, according to the old orthography XÁTIVA, a city of Spain in the province of Valencia, is picturesquely situated on the margin of a beautiful and fertile huerta or plain, at the foot of an overhanging eminence, on the right bank of the Albáida, a tributary of the Júcar. The principal public building is the collegiate church, begun in 1414; it has a fine dome. There are three parish churches besides, and twelve religious houses, also a hospital. The manufactures of the place are unimportant, and its trade purely local. The population in 1877 was 14,534.

Játiva, the Sætabis of Pliny and Martial, was celebrated in the time of the Romans for its linen manufactures. It was then known also as Valeria Augusta. It is believed to have been of Phœnician origin. During the time of the Moors, who knew how to utilize its fine situation and fertile neighborhood, it enjoyed great prosperity. It was taken in 1224 by Jaime I. of Valencia; and in 1347 it received the rank of a city. In the succession war it sustained a long siege with great firmness and bravery, and, when taken at last, received from its captors the name of San Felipe. Játiva was the birthplace of the painter Ribera (1588), and to it also the historical family of the Borgias or Borjas originally belonged.

JÁTS, an Indian people estimated to form two-fifths of the entire population of the Punjab and half that of the Rájput states. They are also widely spread through Sind, Baluchistan, and the North-Western Provinces. Their traditions indicate an immigration from Ghazní or Kandahar, but writers of authority have identified them with the ancient Getæ,[1] and there is strong reason to believe them a degraded tribe of Rájputs, whose Scythic origin has also been maintained. Dr. Trumpp,[2] however, regards them as the first Aryan settlers in the valley of the Indus, and their language strongly favors this view. The Játaki, or Ját vernacular, retained by them with singular tenacity, is a variety of Sindhi, and a pure Sanskrit tongue, exhibiting unusually early grammatical forms. Hindu legends point to a prehistoric occupation of the Indus valley by this people, and at the time of the Mahometan conquest of Sind (712 A.D.) they, with a cognate tribe called Meds, constituted the bulk of the population. They enlisted under the banners of Mohammed Kásim, but at a later date offered a vigorous resistance to the Arab invaders. In 836 they were overthrown by Amran, who imposed on them a tribute of dogs, and used their arms to vanquish the Meds. In 1025, however, they had gathered audacity, not only to invade Mansura, and compel the abjuration of the Mussulman emír, but to attack the victorious army of Mahmúd, laden with the spoil of Somnáth. Chastisement duly ensued: a formidable flotilla, collected at Múltán, shattered in thousands the comparatively defenceless Jât boats on the Indus, and annihilated their national pretensions. In recent times the valor of the race showed itself in the two sieges of Bhartpur, the seat of a Ját dynasty, in 1805 and 1826, and has long been conspicuous in the military qualities of the Sikhs. They are a migratory stock. We hear of early Ját settlements on the shores of the Persian Gulf; there was in the 9th century a Ját quarter in Antioch; and a colony established in the Chaldæan marshes defied during twenty-four years the power of the caliphs, and was finally vanquished and deported to the Cilician frontier in 834. The Játs are now mainly agriculturists and cattle breeders, rearing with extraordinary skill and care large flocks of camels, in the Mekran and the desert tracts of Sind. In their settlements on the Ganges and Jumna, extending as far east as Bareilly, they are divided into two great clans, the Dhe and the Hele; while in the Punjab there are said to be one hundred different tribes. Their religion varies with locality. East of the Rávî they profess a modified Brahmanism, discarding the restrictions of caste; in the Punjab they have largely embraced Sikh tenets; while in Sind and Baluchistan they are Mahometans. They are in general a harmless, industrious people, preserving in songs and legends the memory of better times. Under favorable conditions, however, old predatory habits revive, and their wandering instinct leads them, in the guise of itinerant traders, far into Central Asia. Indeed, there is plausible though not conclusive evidence that the Gipsies owned them as progenitors.[1] In appearance they are not ill-favored, though extremely dark; they have good teeth, and large beards, sometimes stained with indigo. Their inferiority of social position, however, to some extent betrays itself in their aspect, and tends to be perpetuated by their intellectual apathy.

JAUBERT, Pierre Amédée Émilien Probe (1779–1847), French Orientalist, was born at Aix in Provence, June 3, 1779. He was one of the most distinguished pupils of the Orientalist Silvestre de Sacy, whose funeral *Discours* he pronounced in 1838. Jaubert acted as interpreter to Napoleon in Egypt in 1798–99, and on his return to Paris held various posts under Government. In 1802 he accompanied Sebastiani on his Eastern mission; and in 1804 he was with General Brune at Constantinople. Next year he was despatched to Persia to arrange an alliance with the shah; but on the way he was seized and imprisoned in a dry cistern for four months by the pasha of Bayazid. The pasha's death freed Jaubert, who successfully accomplished his mission, and rejoined Napoleon at Warsaw in 1807. In 1818 he undertook a journey with Government aid to Tibet, whence he succeeded in introducing into France 400 Cashmere goats. The rest of his life Jaubert spent in study, in writing, and in teaching. He became professor of Persian in the Collége de France, and in 1830 was elected member of the Académie des Inscriptions. In 1841 his erudite services were still further rewarded by admission to the peerage of France, and by the rank of counsellor of state. He died at Paris, January 27, 1847.

Besides articles in the *Journal Asiatique* we have from Jaubert *Voyage en Arménie et en Perse, fait dans les années* 1805–6, 1821 (the edition of 1860 has a notice of Jaubert, by M. Sédillot); *Éléments de la Grammaire Turque*, 1823; *Géographie d'Edrisi*, 1824; *Vie de Djenghiz Khan*, 1841; and *Relation de l'ambassade de Mohammed Seïd Wahid Effendi* (*Texte Turque*), 1843. He also revised Meyendorff's *Voyage d'Orenbourg à Boukhara*, 1826; and abridged Venture's "Grammaire et Dictionnaire de la langue Berbère," 1824 (in *Recueil de Voyages de la Société de Géographie*, tome vii). See notices in the *Journal Asiatique*, January, 1847, and the *Journal des Débats*, January 30, 1847.

JAUER, chief town of a circle in the government district of Liegnitz, in the province of Silesia, Prussia, is situated on the Wüthende Neisse. St. Martin's church, recently renovated, dates from 1267–90, and the evangelical church from 1655. The castle has been a penitentiary since 1746; and in the town there is a Protestant gymnasium and a hospital. Jauer manufactures leather, buckskin, carpets, cigars, carriages, and gloves, and is specially famous for its sausages. Its weekly grain and cattle market was instituted in 1404. The population in 1875 was 10,404.

Jauer was formerly the capital of a principality embracing 1200 square miles of the principality of Schweidnitz, now occupied by the circles of Jauer, Bunzlau, Löwenberg, Hirschberg, and Schönau. It was separated from Schweidnitz, in 1314, but lapsed to the Bohemian crown in 1392. Jauer was formerly the prosperous seat of the Silesian linen trade, but the troubles of the Thirty Years' War, in the course of which it was burned down three times, permanently injured it.

JAUHARY. Abu Naṣr Isma'íl ibn Ḥammád el-Jauhary of Fáráb, a district beyond the Jaxartes, on the borders of Turkestan, is one of the fathers of Arabic lexicography. After the fashion of the older Arabic philologers he completed his studies by a residence among the tribes of the Arabian desert, and finally established himself at Naisâpûr, where he died by a fall from the roof of his house, leaving the revision of his great lexicon, the *Ṣiḥáḥ fi'l-Lugha*, incomplete. According to some accounts he committed suicide in a fit of insanity. Hajji Khalífa (iv. 91) places his death 303 A. H. (1002–3 A. D.); others give 398 or 400.

The *Ṣiḥáḥ* has been repeatedly printed in the East, as at Búlák 1282 (1865), and again in 1875. Of the edition projected by Ev. Scheidius, only one part appeared in 1776. See Hamaker, *Spec. Cat.*, p. 48; Dozy, *Leyden Catalogue*, i. 67; Pertsch, *Gotha Cat.*, No. 378; Ḥ. Khalífa, *ut supra*.

JAULNA. See Jálna.

JAUNDICE (Fr. *jaunisse* from *jaune*, yellow), or Icterus (from its resemblance to the color of the golden oriole, of which Pliny relates that if a jaundiced person looks upon it he recovers but the bird dies), a term in medicine applied to a yellow coloration of the skin and other parts of the body, depending in most instances on some derangement affecting the liver. This yellow color is due to the presence in the blood of bile or of some of the elements of that secretion. Jaundice, however, must be regarded more as a symptom of some morbid condition previously existing than as a disease *per se.*

The manner in which jaundice is produced is still a matter of debate among physicians, but it is generally admitted that there are two classes of causes, either of which may bring about this condition. In the first place any obstruction to the passage of bile from the liver into the intestinal canal is sooner or later followed by the appearance of jaundice, which in such circumstances is due to the excessive absorption of bile into the blood. To this variety the term *obstructive* jaundice is applied. But secondly, a form of jaundice may be produced by causes not embracing obstruction, but including a variety of morbid conditions affecting either the secreting structure of the liver or the state of the blood, and to this the term *non-obstructive* jaundice is applied.

---

[1] See Gipsies, vol. x. p. 551; also *Edinburgh Review*, No. 303. p. 131.

Obstructive jaundice may be due to the following causes:—(1) simple catarrh of the hepatic and common bile duct (see DIGESTIVE ORGANS), whereby the calibre of these channels is narrowed (this is frequently the result of cold or of temporary gastric disturbance, but it may become a chronic condition); (2) impaction of gall stones or plugs of hardened mucus in the ducts; (3) general congestion of the liver, either alone or in connection with pre-existing disease in the heart or lungs; and (4) pressure of morbid growths either external to the liver or in its substance.

Obstruction from these causes may be partial or complete, and the degree of jaundice will vary accordingly; but it is to be noted that extensive organic disease of the liver may exist without the evidence of obstructive jaundice.

The effect upon the liver of impediments to the outflow of bile such as those above indicated is in the first place an increase in its size, the whole biliary passages and the liver cells being distended with retained bile. This enlargement, however, speedily subsides when the obstruction is removed, but should it persist, the liver ultimately shrinks and undergoes atrophy in its whole texture. The bile thus retained is absorbed into the system, and shows itself by the yellow staining seen to a greater or less extent in all the tissues and many of the fluids of the body. The kidneys, which in such circumstance act in some measure vicariously to the liver and excrete a portion of the retained bile, are apt to become affected in their structure by the long continuance of jaundice.

The symptoms of obstructive jaundice necessarily vary according to the nature of the exciting cause, but there generally exists evidence of some morbid condition before the yellow coloration appears. Thus, if the obstruction be due to an impacted gall stone in the common or hepatic duct, there will probably be the symptoms of intense suffering characterizing "hepatic colic" (see COLIC), after which the jaundice appears. In the cases most frequently seen—those, namely, arising from simple catarrh of the bile ducts due to gastro-duodenal irritation spreading on to the liver through the common duct—the first sign to attract attention is the yellow appearance of the white of the eye, which is speedily followed by a similar color on the skin over the body generally. The yellow tinge is most distinct where the skin is thin, as on the forehead, breast, elbows, etc. It may be also well seen in the roof of the mouth, but in the lips and gums the color is not observed till the blood is first pressed from them. The tint varies, being in the milder cases faint, in the more severe a deep saffron yellow, while in extreme degrees of obstruction it may be of dark brown or greenish hue. The color can scarcely, if at all, be observed in artificial light.

The urine exhibits well marked and characteristic changes in jaundice which exist even before any evidence can be detected on the skin or elsewhere. It is always of dark brown color resembling porter, but after standing in the air it acquires a greenish tint. Its froth is greenish yellow, and it stains with this color any white substance. It contains not only the bile coloring matter but also the bile acids. The former is detected by the play of colors yielded on the addition of nitric acid, the latter by the purple color produced by placing a piece of lump sugar in the urine tested, and adding thereto a few drops of strong sulphuric acid. This test for the bile acids is dwelt upon by Dr. George Harley as an important point in serving to distinguish jaundice with obstruction from jaundice without obstruction, in the latter of which, although there is bile pigment in the urine, the bile acids are absent.

The contents of the bowels also undergo changes, being characterized chiefly by their pale clay color, which is in proportion to the amount of hepatic obstruction, and to their consequent want of admixture with bile. For the same reason they contain a large amount of unabsorbed fatty matter, and have an extremely offensive odor.

Constitutional symptoms always attend jaundice with obstruction. The patient becomes languid, drowsy, and irritable, and has generally a slow pulse. The appetite is usually but not always diminished, a bitter taste in the mouth is complained of, while flatulent eructations arise from the stomach. Intolerable itching of the skin is a common accompaniment of jaundice, and cutaneous eruptions or boils are occasionally seen. Yellow vision appears to be present in some very rare cases. Should the jaundice depend on advancing organic disease of the liver, such as cancer, the tinge becomes gradually deeper, and the emaciation and the debility more marked towards the fatal termination, which in such cases is seldom long postponed. Apart from this, however, jaundice from obstruction may exist for many years, as in those instances where the walls of the bile ducts are thickened from chronic catarrh, but where they are only partially occluded. In the common cases of acute catarrhal jaundice, recovery usually takes place in two or three weeks.

The treatment of this form of jaundice bears reference to the cause giving rise to the obstruction. In the ordinary cases of simple catarrhal jaundice, or that following the passing of gall-stones, a light nutritious diet (milk, soup, etc., avoiding saccharine and farinaceous substances and alcoholic stimulants), along with counter-irritation applied over the right side, and after a few days the use of laxatives which tend to promote the flow of bile, will be found to be advantageous. Rhubarb, taraxacum, podophyllum, mercury, are among the remedies which have long been employed for this purpose, but the recent researches of Professor Rutherford have brought to light certain other agents (euonymin, iridin, leptandrin, etc.), which exercise a powerful influence as cholagogues, and are now coming into use. Diaphoretics and diuretics to promote the action of the skin and kidneys are useful in jaundice. In the more chronic forms, besides the remedies above named, the waters of Carlsbad are of special efficacy. Where the jaundice depends on changes in the substance of the liver, altering its structure, such as cancerous deposit, all that can be accomplished is the palliation of symptoms, including the jaundice, which may be mitigated by the treatment already indicated. With the view of supplying bile to the alimentary canal, Dr. Harley recommends the use of inspissated ox-gall in doses of 5 to 10 grains administered in capsules of gelatin.

2. *Jaundice without obstruction* is observed to occur as a symptom in certain fevers, *e. g.*, yellow fever, ague, and relapsing fever, and in pyæmia (blood poisoning), also as the effect of the action of certain poisonous substances, such as copper, mercury, antimony, phosphorus, etc., and the venom of snake-bites. It is occasionally seen in new-born infants. It is sometimes suddenly induced as the result of strong mental excitement or emotion. Much difficulty has always been felt to account for this form of jaundice, and numerous theories have been advanced to explain its occurrence. Many of such cases might probably, as Virchow observes, be found on careful investigation to depend on some obstruction in the biliary passages; but there can be no doubt that many others admit of no such explanation, and as regards these it is generally held that they are probably connected with some alteration in the coloring matter of the blood, the source, it is believed, of the bile pigment. Others suppose this form of jaundice to be due to an excess in the normal reabsorption of bile into the blood. The pathology, however, is still unsettled. Jaundice of this kind is almost always slight, and neither the urine nor the discharges from the bowels exhibit changes in appearance to such a degree as in the obstructive variety. Grave constitutional symptoms are often present, but

they are less to be ascribed to the jaundice than to the disease with which it is associated.

The name *malignant jaundice* is sometimes applied to that very fatal form of disease otherwise termed acute yellow atrophy of the liver. See ATROPHY.

(J. O. A.)

JAUNPUR, a British district in the lieutenant-governorship of the Northwestern Provinces, India, lying between 25° 23′ 15″ and 26° 12′ N. lat., and between 82° 10′ and 83° 7′ 45″ E. long. It forms the northeastern district of the Allahábád division, and is bounded on the N. and N. W. by the Oudh districts of Faizábád, Partabgarh, and Sultánpur, on the E. and N. E. by Gházípur and Azamgarh, on the S. by Benares and Mírzápur, and on the W. by Allahábád.

The district of Jaunpur forms part of the wide Gangetic plain, and its surface is accordingly composed of a thick alluvial deposit. The whole country is closely tilled, and no waste lands break the continuous prospect of cultivated fields. The northern and central positions are richly wooded. The district is divided into two unequal parts by the sinuous channel of the Gumti, a tributary of the Ganges, which flows past the city of Jaunpur. Its total course within the district is about 90 miles, and it is nowhere fordable. It is crossed by two famous bridges, one at Jaunpur and the other 2 miles lower down. The other rivers are the Sai, Barna, Pilli, and Basohi. Lakes are numerous in the north and south; the largest has a length of 8 miles.

The census of 1872 was taken upon an area of 1556 square miles, and it disclosed a total population of 1,025,961, of whom 545,752 were males and 480,209 females. Jaunpur is essentially a Hindu district, in spite of its long subjection to Mahometan rulers. The returns show 929,525 Hindus to 96,319 Mahometan; the Christian population (European and native) numbers 117. There are only two towns with more than 5000 inhabitants,—Jaunpur, 23,327, and Machhlishahr, 8715.

The ordinary soil of Jaunpur is a mixture of mould, clay, and sand; but in old river beds and the basins of temporary lakes a rich black alluvial deposit may occasionally be found. The harvests are those common to the rest of Upper India. The crops yielded are cotton, rice, *bájra, joár, moth,* wheat, barley, oats, pease, and other pulses. Sugar yields the greatest profit, but it requires great care. Indigo, poppy, tobacco, and vegetables are also cultivated. The Gumti is liable to sudden inundations during the rainy season, owing to the high banks it has piled up at its entrance into the Ganges, which act as dams to prevent the prompt outflow of its flooded waters. These inundations extend to its tributary the Saí. Much damage was thus effected in 1774; but the greatest recorded flood took place in September, 1871, when 4000 houses in the city were swept away, besides 9000 more in villages along its banks. On the other hand, Jaunpur has been comparatively free from drought, the great plague of the northwest generally, as of the rest of India. The district is almost entirely devoted to agriculture, and its trade is confined to raw materials and food-stuffs. The principal fairs are held at Mariáhu in September, and at Karchuli in March; they are attended by from 20,000 to 25,000 pilgrims and traders. The Oudh and Rohilkhand railway passes through the district. There are 145 miles of metalled and 364 of unmetalled roads. The Gumti and Saí are navigable for boats of moderate burden. The climate is moist, and the temperature is more equable, and the rain more evenly distributed throughout the year, than in most districts of the Northwestern Provinces. The average rainfall for 1861–70 was 43 inches; during that period the maximum was 51.6 inches, the minimum 22 inches. There are two charitable dispensaries.

In prehistoric times Jaunpur seems to have formed a portion of the Ajodhya principality, and when it first makes an appearance in authentic history it was subject to the rulers of Benares. With the rest of their dominions it fell under the yoke of the Musalmán invaders in 1194. From that time the district appears to have been ruled by a prince of the Kanauj dynasty, as a tributary of the Mahometan suzerain. In 1388 Malik Sarwar Khwája was sent by Muhammad Tughlak to govern the eastern province. He fixed his residence at Jaunpur, made himself independent of the Delhi court, and assumed the title of Sultán-us Shark, or eastern emperor. For nearly a century the Sharki dynasty ruled at Jaunpur, and proved formidable rivals to the sovereigns of Delhi. The last of the dynasty was Sultán Hussen, who passed his life in a fierce and chequered struggle for supremacy with Bahlol Lodi, then actual emperor at Delhi. At length, in 1478, Bahlol succeeded in defeating his rival in a series of decisive engagements. He took the city of Jaunpur, but permitted the conquered Hussen to reside there, and to complete the building of his great mosque, the Jamá Masjíd, which now forms the chief ornament of the town. Many other architectural works in the district still bear witness to its greatness under its independent Musalmán rulers. Under the Lodi dynasty the history of Jaunpur contains nothing more than the stereotyped narrative of provincial intrigue, constant revolt, and bloody repression. When the last of that line was killed, a local kingdom was once more established for a short time in the district, but after the fall of Agra and Delhi Jaunpur was recovered, and the district thenceforward formed a portion of the Mughal empire. Nothing worthy of note occurred in connection with this district until 1722, when it was transferred, with Benares, Gházípur, and Chunár, to the nawáb wazír of Oudh, who appointed a commander to the districts with the title of rájá of Benares. The first connection of the British with the district arose in 1765, when it passed for a short time into their hands after the battle of Baxar. In 1775 it was finally made over to them by the treaty of Lucknow. From that time nothing occurred which calls for notice till the date of the mutiny. On the 5th June, 1857, when the news of the Benares revolt reached Jaunpur, the Síkhs mutinied. The district continued in a state of complete anarchy till the arrival of the Gurkhá force from Azamgarh in September. In November the surrounding country was lost again, and it was not till May, 1858, that the last smouldering embers of disaffection were stifled by the repulse of the insurgent leader at the hands of the people themselves.

JAUNPUR, a municipal town and the administrative headquarters of the above district, situated in 25° 41′ 31″ N. lat. and 82° 43′ 38″ E. long., on the northern bank of the river Gumti. Jaunpur is a very ancient city, the former capital of a considerable Mahometan kingdom, which once extended from Budáun and Etáwah to Behar. It abounds in splendid architectural monuments, most of which belong to the Pathán period, when the rulers of Jaunpur made themselves independent of Delhi. Among the remains are the fort of Firoz, the *hammams* or baths, the Atála Masjíd and the Jinjiri Masjíd, mosques built by Ibráhím, the Dariba mosque constructed by two of Ibráhím's governors, the Lál Darwáza erected by the queen of Mahmud, the Jamá Masjíd or great mosque of Hussen, and the splendid bridge over the Gumti, erected by Mumzin Khán, governor under the Mughals, in 1569–73. During the mutiny of 1857 Jaunpur formed a centre of great disaffection. The town still possesses a considerable trade. There are two railway stations there. The population in 1872 was 23,327, comprising 12,369 Hindus and 10,949 Mahometans and 9 "others."

JAVA.

Plate VIII.

AMONG the islands of the Indian archipelago Java is not the largest, being surpassed in this regard by Borneo, New Guinea, Sumatra, and Celebes; but in every other respect it is the most important of them all. It has passed through the most remarkable vicissitudes, has been the scene of the most eventful occurrences, and possesses the noblest memorials of bygone splendor. It supports a larger population than all the other islands of the Indian Ocean together, a population as dense indeed as that of the most populous of European countries. In natural beauty it rivals the most favored regions of the world. Through the mildness of its climate and the industry of its people it possesses a richer store of valuable productions than almost any country of equal extent can boast: its rice-fields make it the granary of the East Indian islands, and its coffee and sugar plantations are a perpetual source of wealth to Holland, the country which has the good fortune to claim its allegiance.[1]

Java lies between 105° 10′ and 114° 34′ E. long., and between 5° 52′ and 8° 46′ S. lat. Its greatest length—measured from Pepper Bay in the west to Banyuwangi in the east—amounts to no less than 622 miles; its greatest breadth—from Cape Bugel in Japara to the south coast of Jokjokarta—is only 121. The area is estimated at 49,176 square miles, nearly four times that of Holland (12,731 square miles). Both physically and administratively the island of Madura, separated from the main island by a narrow strait, must be taken along with Java; and the same is more or less the case with a number of smaller islands—Pulo Panitan or Princes' Island, lying off the most western promontory, the Thousand Islands, the Karimon-Djawa (Carimon Java) archipelago, about 50 miles to the north of Japara, Bawean (Bavean), a little further to the north of Madura, the Sumanap islands to the northeast of Madura, and Deli, Tindjil, Nusa Kambangan, Sempu, and Nusa Barung off the south coast. These all being included, the area of what is officially known as Java and Madura amounts to 51,961 square miles.[2]

There is a striking difference between western and eastern Java in the main features of relief. The western portion, exclusive of the northern alluvial coastland, is a compact mass of mountains culminating in volcanic peaks nowhere interrupted by plains or lowland valleys. In the eastern and larger portion the volcanoes rise in independent clusters, and the valleys between open out into wide champaigns. Even in the east the number of volcanic eminences is exceptionally large; and, if the whole island be taken into view, there is scarcely any region of the world of equal extent which can boast of so many. The following are those which are still in a state of activity:—Gedé (the most western), Tangkuban Prahu, Guntur, Pepandayan, Telaga Bodas, Galung-gung, Tjermé, the Slamat (sometimes called Gedé), Sendără, Sumbing, Merapi, Lawu, Wilis (?), Kelut, Ardjună, Kawi (?), Tenger, Smeru, or Semeru, Lamongan, Rawun, and Idjen. The loftiest of them all is Semeru, with a height of 12,238 English feet.[3]

The central ridge, in which, with the single exception of Muriă, all the volcanic peaks are situated, contains a large number of other summits upwards of 6000 feet in height, and several—such as Wallet, Pangerangu, Merbabu, Gunong Butak, G. Weliran, G. Argowulan, the Yang (Jang) mountains, G. Rante—rise beyond 9000 feet. On both the north and south sides the volcanic chain is flanked by ranges composed of Tertiary rocks; these attain an elevation on the south frequently of between 2000 and 4000 feet, and occasionally in the Preanger Regencies of 5000 or 6000 feet. To the northern flanking range belongs the whole of the island of Madura, which has its highest point in Gunong Tambuko (1541 feet). The northern versant of Java differs from the southern in the great development of its alluvial border, which in one or two places widens out into considerable plains, and from this it naturally results that the streams flowing into the Sea of Java are both in length of course and volume of water more important than those that fall into the Indian Ocean. Their number in both cases is very great; but none even of the northern streams are navigable for vessels of burden, and only a few for boats beyond the reach of the tide. They are all more or less obstructed by mud or sandbanks at their mouths. In the Sunda lands the river names are usually introduced by *Tji*, the Sunda word for river; the equivalent *Kali* is prefixed less frequently to the names in the Javanese portions of the island. The largest and in some aspects the most useful of all the rivers is the Bengawan, or river of Solo, so called from Solo, the popular name of the city of Surakarta. It is in the residency of Surakarta that it takes its rise in the plain bounded by Merapi on the W., by Lawu on the E., and by Gunong Kidul on the S., and it flows through the residencies of Madiun, Rembang, and Surabaya. Except for the last three months of the dry season it is navigable for large boats, and during the whole year for small ones. Next in magnitude to the Solo is the Brantas, called in its lower part the Kalimas, and by Europeans the river of Surabaya. Both rivers debouch into the strait of Madura, and the rapid formation of alluvial deposits in the neighborhood of their mouths gives abundant proof of their disintegrating agency. In 1818 the largest vessels were able to anchor in the roadstead of Surabaya; by 1825 considerable caution had to be observed; and it speedily became evident that the northern approach would soon be completely closed. Between 1850 and 1854 the lower part of the Solo river was diverted into a new channel, and a permanent fairway seemed to be secured. But the condition of the strait has again been the object of solicitude, and two different schemes have been under consideration for the removal of the lower course of the river still further to the north. All along the north coast of Java similar accretions of land are taking place; and steam dredgers have to be kept at work in all the important harbors.

The endless disturbances produced in the original condition of the strata by the continued activity of the volcanic forces render the task of the geologist peculiarly difficult. The volcanic rocks for the most part appear to rest on sedimentary rocks, and these in their turn are pretty certainly supported by granite and syenite. That the sedimentary rocks should all (the modern alluvium of course being excluded) be assigned to the Tertiary period was argued by Junghuhn from the fact that in spite of their difference in composition and character they all contain the same class of fossils; but a few striking examples of fossils and formations that must belong to the diluvial division of the Quarternary period have been pointed out by Staring and Verbeek. Throughout the rocks remains of vertebrates are exceedingly scarce; but of invertebrates there is a great profusion.[4]

---

[1] The above general description is taken from the *Java* of Professor Veth of Leyden, the standard work on the subject.

[2] The orthography of East Indian names is far from constant. Even in the same Dutch book Madura and Madoera, Jokjakarta, Djokjokarta, and Djokdjokarta are to be found. In the present article the *Dj* or *J* is usually given in the more English form of *J*, the *oe* as *u*, and so on.

[3] See Junghuhn's *Java*. Chronological lists of the eruptive and seismical phenomena of the island, and indeed of all the Indian archipelago, are given from time to time in the *Nat. Tijds. voor Ned. Ind.* From Dr. Bergsma's report in the volume for 1880 it appears that in 1878 there were sixteen distinct earthquakes registered throughout the island. That both volcanoes and earthquakes are not without present importance among the physical agencies engaged in the new shaping of the land is shown by such facts as the following:—In 1843, according to Junghuhn's estimate, Mount Guntur flung forth ashes and sand to the extent of 30 million tons; by the great eruption of Mount Galung-gung in 1822, no fewer than 114 villages were laid waste and 4000 persons destroyed; in 1867 an earthquake caused the death of 1000 people in the town of Jokjokarta alone; in 1872 the eruption of Merapi (one of the most active of the volcanoes) proved fatal to many of the inhabitants of Kadu; and the damage to be feared from the ashes thrown out by the same mountain interferes with the planting of coffee in the districts of Probolingo and Remaneh. In 1879 the Preanger Regencies were visited by several severe shocks, and a number of persons were killed. Besides the volcanoes themselves, there are a number of striking forms of volcanic activity to be observed in the island, such as the so-called mud-volcano at Grobogan, the gas-fountains or holy-fires of Melati Derat, and the Pakaraman or Guwa Upas (Valley of Poison) in Banyumas on the Dieng mountains. Hot springs are common.

[4] See Staring, "Sur l'existence du terrain diluvien à Java," in *Archives Néerlandaises*, 1867, and "Voorkomen van dil. gronden op Java," in *Vers. of Kon. Akad. van Wet., Afdeel. Natuurk.*, 1865; Verbeek, "Geologie van Java," in *Tijdschr. van het Aardk. Genoot.*, part i.; Lorié, *Bijdrage tot de Kennis der Jav. eruptiefgesteenten*, Rotterdam, 1879; Martin, *Die Tertiärschichten auf Java nach den Entdeckungen von Fr. Junghuhn*, Leyden, 1879; "Sur les volcans de l'île de Java et leurs rapports avec le reseau pentagonal," in *Comptes Rendus*, tom. lxxix. pp. 1058–1061. There has as yet been no regular geological survey of Java; and much new light may be expected from the labors which the Government has at last determined to prosecute. From Verbeek and Fannema's "Nouv.

In keeping with its geological structure, Java appears in general to be in the matter of economic minerals the poorest of the great islands of the archipelago.[1] Coal is very common, in thin strata and small "pockets," both in Java itself and in Madura and the lesser islands, but it has hitherto been found impossible to turn it to any considerable account. A variety of clays fit for bricks, earthenware, and porcelain, a peculiar kind of clay (*ampo*) eaten as a dainty by the natives, good limestone and marble, petroleum, and sulphur have been more or less regularly worked. Salt is obtained from the mud wells of Kuwu and Selo (Samarang), and saltpetre at Sutji in the department of Gresik.

Climate.—Java being situated but a short distance from the equator, with the wide expanse of the Indian Ocean extending to the south, the climate is one of tropical heat and moisture.

At Batavia, the only place where a long series of meteorological observations is available, the greatest maximum temperature of the air between 1866 and 1878 was 96.08 Fahr., in November 1877, and the lowest minimum 66.02, in September of the same year. The mean temperature during the same period was 78.69. Taking the monthly means we find January 77.48, February 77.52, March 78.24, April 79.34, May 79.59, June 78.83, July 78.25, August 79.14, September 79.35, October 79.50, November 79.23, December 77.86. It is this long unbroken continuity of high temperatures which proves trying to the European constitution, for the new-comer seldom feels himself much oppressed by the heat. The maximum daily temperature occurs in January, June, and July at 2 o'clock and in the other months at 1 o'clock P.M. The highest maximum of barometric pressure recorded between 1866 and 1878 was 30 inches in July 1877, and the lowest minimum 29.64 inches in December 1870. In the ten years 1866–1875 the difference between the highest daily mean and the lowest was only 0.295 of an inch.

Java is situated in the region of the southeast trade wind, and that is the prevailing direction of the wind during one half of the year, from April to October. During the other half of the year a northwest or west wind (the physical continuation of the northeast trade wind) blows with nearly equal steadiness. The former period is known as the dry season or the east monsoon, and the latter as the rainy season or the west monsoon. The distinction between the dry and the rainy seasons is most marked in the eastern portion of the island; and indeed when we come as far west as Batavia it cannot be said that there is any part of the year altogether free from rain. During the dry season the well-known phenomenon of land and sea breezes is very distinctly exhibited; during the rainy season, through obvious causes, the alternation becomes much less regular.

In a country of such bold and varied relief as Java, the rainfall naturally differs very strikingly according to locality both in annual amount and in distribution in time. In 1878, for example, the number of rainy days (*Natuurk. Tijds. voor Ned. Ind.*, 1880) was for Batavia (at 23 feet above the sea-level) 131, at Buitenzorg (1069 feet) 220, at Wiradessa in Pekalongan (at the sea-level) 118, and so on. According to the Batavian observations for 1864–1878, the following figures show the annual rainfall:—

	Inches.		Inches.		Inches.
1864	61·57	1869	76·22	1874	77·75
1865	79·33	1870	80·78	1875	75·82
1866	84·88	1871	89·40	1876	96·57
1867	91·65	1872	98·58	1877	55·35
1868	54·21	1873	56·77	1878	59·60

This gives a mean annual fall of 75·89 inches. During these fifteen years the largest amount registered for any twenty-four hours was 6·9 inches; and during the thirteen years from 1866 to 1878 the largest amount registered in any single hour was 3·6 inches. More than half of the annual amount of rain on an average falls in the three months December, January, and February. The following figures are the percentages for all the months according to the 1864–1878 observations:—

January	21·0	May	4·4	September	3·8
February	18·5	June	4·9	October	6·2
March	9·4	July	2·9	November	6·4
April	5·9	August	2·5	December	14·2

Between 1867 and 1877, 1041 thunderstorms were observed at Batavia,—November, December, and January being the months with the greatest number, and June, July, and August those with the least.[2]

Vegetation.—The vegetation of Java is rich and diversified. Few of the plants being deciduous, the island at all times presents the same appearance as the most fertile temperate regions at the height of summer. The villages and even the smaller towns are in great measure concealed from view by the abundant and abiding verdure; and their position in the landscape is to be recognized mainly by the different appearance presented by their groves and orchards. The character of the vegetation as a matter of course varies with the character of the soil; but at once more obvious and more general are the modifications conditioned by increase of elevation. Junghuhn divided the island into four botanical zones, and his division has been commonly adopted by his successors. The first or tropical zone extends from the seaboard to a height of 2000 feet; the second or that of moderate heat has its upper limit at a height of about 4500 feet; the third or comparatively cool region reaches a height of 7500 feet; and the fourth or coldest region comprises all that lies above that elevation. It need hardly be added that the lines of demarcation are far from rigid, and, if they were to follow the actual appearance of certain definite vegetable forms, would dip and rise at every advance. It is at once evident also that from the structure of the island the lowest zone has by far the most extensive area; the second indeed is only a fiftieth of the first, and the third is only a five-thousandth. The lowest zone is the region of the rice-fields and sugar plantations, of cocoa-nuts, cinnamon, and cotton. According to their character the coasts are fringed with mangroves, nipah, and other palm trees, and the kayu gabas (*Alstonia scholaris*); the ponds and lakelets are covered with *Utriculariæ* and lotus flowers; vast prairies are clothed with the silvery alang-alang grass, broken by thickets of bamboos and patches of the taller eri grass and glagah. The second zone is the region more especially of the coffee and the tea plantations, of the areng or sugar palm, and of maize. In the forests there is a great profusion of woody lianas, rotangs, and cissus varieties. In the third zone, which consists mainly of the slopes of volcanic mountains, but also comprises a few plateaus, there is little cultivation except in the Tenger mountains, where the natives raise Indian corn, cabbage, and potatoes, and at Simpungan (the highest village in Java, 6680 feet) on the Dieng plateau, where even tobacco is most successfully cultivated. The fourth zone, so far as phanerogamous plants are concerned, has a very restricted vegetation, somewhere about one hundred species being known; but there is a corresponding abundance of cryptogams: fungi are common, and mosses cover the ground and invest the trees. The whole flora of this upper region bears a strong European cast.

According to a writer in the *Tijdschrift van Nijverheid en Landbouw*, 1879, not less than one-fourth to one-fifth of the area of Java is still covered with forest, in spite of the fact that in various quarters reckless destruction has been allowed to go on. The abundant moisture of the vegetation happily prevents the spread of the fires by which the natives often clear the prairies or jungles. Extensive tracts of virgin forest exist, more particularly in the south of the

---

faits géol. observés à Java," in *Arch. Néerland.*, 1881, we learn that the existence of granite and other pre-Tertiary rocks, the absence of which has long been regarded as one of the chief points of difference between Java and Sumatra, is now ascertained beyond all dispute.

[1] See Verbeek, *De Mijnwetten in Ned. Ind.*, Batavia, 1879.

[2] See *Observations made at the Magnetical and Meteorological Observatory at Batavia* (vol. i., 1871; vol. iv., 1879).

residencies of Bantam, the Preanger Regencies, Banyumas, Pasuruan, Kediri, Probolingo, Besuki, and Banyuwangi; and many of the principal mountains—G. Ayang, G. Tjermé, G. Slamat, G. Wilis, G. Ardjunô, G. Raon, etc.,—still preserve their natural covering of luxuriant foliage. In the first zone the forests are largely composed of *Magnoliaceæ* and *Anonaceæ*; but the loftiest trees are rather the *Mimusops acuminata*, the *Spathodea gigantea*, and the *Irina glabra*, which reach a height of 120 feet. In the second zone the first rank must be given to the rasamala (*Liquidambar Altingia*), the trunks of which run straight up for 90 or 100 feet before they break into branches. The tree, however, is only found in the Preanger Regencies and the contiguous portions of Buitenzorg. Among the other trees more generally characteristic of the zone are the puspa (*Schima Noronhæ*), yielding fine, red, heavy timber, the ki sapi (*Gordonia excelsa*), the gadok (*Bischofia javanica*), the bayur (*Pterospermum Blumeanum*), and *Epicharis densiflora*. Throughout the greater part of both the lower regions the banyan-tree and several closely allied forms are extremely common.

Hitherto comparatively little advantage has been taken of the Javanese wealth of timber. If the native states and Madura be left out of account, all the woods and forest, with the exception of such portions as have been formally disposed of to private possessors, are considered as Government property, and are managed under a new system introduced in 1874. By this the teak forests or plantations are singled out for particular treatment. They exist in the residencies of Tagal, Samarang, Japara, Surabaya, Madiun, Kediri, and are estimated to occupy 2300 square miles. The seaports where the timber trade is chiefly carried on are Batavia, Samarang, Surabaya, and Gresik. The net profit realized by the Government from the forest department was only £58,000 in 1879.

Reforesting has been commenced in various places—more particularly on the Sumbing, Sendara, Merbabu, and Unarang. The *Eucalyptus globulus*, the juar (*Cassia florida*, Vahl), a rapidly growing tree indigenous to Sumatra, and the surian (*Cedrela febrifuga*, Bl.), are being largely employed by the Government for this purpose.

Zoology.—In respect of its fauna, Java differs from Borneo, Sumatra, and the Malay peninsula far more than these differ among themselves; and at the same time it shows close resemblances—not exhibited by Borneo and Sumatra to the Siamese peninsula and also to the Himalayas. No genus and only five or six of the ninety species of Javanese mammals are confined to the island; and of the two hundred and seventy species of land birds only forty are peculiar. Thirteen genera of mammals, including the elephant, the tapir, and the Malay bear, found in the rest of the Malay region, are altogether absent; and twenty-five Malayan genera of birds—comprising jays, gapers, bee-eaters, woodpeckers, hornbills, cuckoos, pheasants, and partridges—are in like case.[1]

The Javanese rhinoceros, the largest of the mammals in the island, differs from that of Sumatra in having only one horn instead of two. It ranges over the highest mountains, and its regular paths—worn into deep channels—may be traced up the steepest slopes and round the rims of even active volcanoes. Of wild swine there are two species, *Sus vittatus* in the hot region and *Sus verrucosus* in the temperate. Both are extremely abundant, and their depredations are the cause of much loss; in the residency of Japara, for instance, upwards of five thousand have been killed in two months. Not much less than the rhinoceros is the banting or *Bos sundaicus*, to be found in all the uninhabited districts between 2000 and 7000 feet of elevation. The kidang or mintjac (*Cervulus muntjac*) and the rusa (*Rusa hippelaphus*) are the chief representatives of the deer kind; the former is a delicate little creature occurring singly or in pairs both in the mountains and in the coast districts; the latter, living in herds of from fifty to one hundred in the grassy "opens," gives excellent sport to the native hunters. The kantjil (*Tragulus javanicus*) is little bigger than a hare. The royal tiger—the same species as that of India—is still frequent enough in the forests to make a tiger-hunt a characteristic Javanese scene, and to permit the native princes to exhibit at times a tiger and buffalo fight.[2] The leopard is also common: in the warm region specimens are occasionally found in which the coat is almost uniformly black, the spots, however, being visible on inspection. In the tree tops the birds find a treacherous enemy in the matjan rempak or wild cat (*Felis minuta* or *Leopardus javanensis*), about the size of a common cat, with the markings of its larger namesake. The dog-tribe is represented by the fox-like adjag (*Canis rutilans*), which hunts in ferocious packs.

The *Cheiroptera* hold a prominent place in the fauna. Remarkable especially for size is the kalong or flying-fox (*Pteropus edulis*), a fruit-eating bat, which may be seen hanging during the day in black clusters asleep on the trees, and in the evening hastening in dark flocks to its favorite feeding grounds in the forest. The damage these do to the young cocoa-nut trees, the maize, and the sugar-palm leads the native to snare and shoot them; and their flesh is good to eat. Smaller kinds of bats are not less abundant,—perhaps the most common species being the *Nycticejus Temminckii*. In certain places they congregate in myriads like seafowl on the cliffs, and their excrements produce extensive guano deposits, which the natives of Surakarta and Madiun, for example, utilize as sources of saltpetre. The house of Canneman, near Besuki, is the chosen haunt of a monstrous colony which have successfully defied all efforts made to expel them. The creature known to the Europeans as a flying cat, and to the natives as the kubin, is the *Galeopithecus variegatus*, marking a sort of transition from the bats to the lemuroids. Of these last Java has several species, held in awe by the natives for their supposed power of fascination. The apes are represented by the wou-wou (*Hylobates leuciscus*), the lutung, and kowi (*Presbytes maurus* and *pyrrhus*), the surili (*Presbytes mitratus*), and, most general of all, *Macacus cynomolgus*. The existence of bands of the wou-wous is only too distinctly proved in the second zone by the loud and cacophonous outcry from which their name is derived. The lutung or black ape prefers the temperate region, though it is met with as high as 7000 feet above the sea and as low as 2000. The *Macacus* keeps for the most part to the warm coast regions. Rats, mice, porcupines, a particular kind of hare (*Lepus nigricollis*—confined to a very limited habitat), squirrels, flying-squirrels, are the Javanese representatives of the *Rodentia;* and the *Insectivora* comprise a shrew mouse, three species of *Cladobates*, and *Hylomys suillus*, peculiar to Java and Sumatra.

Agriculture.—In the eyes of a Javanese to lack rice is to lack food. About the introduction of this divine cereal he tells strange legends, considering it the offspring of the body of Dewie Srie. The priesthood of this goddess is more influential often than that of the Prophet; at an autumn festival the worshippers may be heard uttering the Mahometan Bismillah, and following it up with the sevenfold repetition of her name. For a full harvest the choice of a lucky day is of greater importance than the careful tillage of the field; and to insure a proper selection the Javanese must have the "windu," the year, the month, the day, the hour. In each of the eight years of the windu a special method of ploughing, of sacrificing, praying, etc., must be employed.[3] The Javanese is thus far from being an enlightened cultivator even of his one indispensable grain; and though the ancestral custom must in many cases be really the result of ancient experience, the blindfold way in which it is applied results in very bad husbandry. The cultivation of the rice appears at present to be often carried on at a dead loss. The varieties of the cereal known to the Javanese are numerous; but they are commonly grouped as *Oryza sativa*, *præcox*, *montana*, and *glutinosa*. The first is the kind mainly sown in the *sawahs* or irrigation-fields; the *montana*, on the other hand, is suited for those in which there is no artificial irrigation,—either gogoland, which has been only rudely cleared from the forest and brought under imperfect or temporary tillage, or the tagal, which is regularly subject year after year to the processes of husbandry.

Some idea may be formed of the extent of agricultural activity in Java from the following statement of the amount of land (in bouws,—the bouw or bahu being about 1¾ acres) cultivated for their own use by the natives of

---

1875	2,399.770	2,092,152	307,618	91,531	823,125
1876	2,581,807	2,247,490	334,317	98,210	870,725
1877	2,615,906	2,291,135	324,771	97,899	871,662
1878	2,840,856	2,417,480	423,376	106,252	950,372

In 1879, leaving out of view the native territories and the private estates, the area under cultivation was 2,929,644 bouws. Of this aggregate, 1,504,052 bouws were sawahs capable of irrigation, 813,153 sawahs dependent on the rains, 49,219 marsh-sawahs, and 563,220 tagal fields. The system of communal proprietorship and annual redivision of the soil largely holds throughout Java, especially in the case of the irrigated lands; in a large number of instances it has taken the place of individual ownership within quite recent years, and in other instances the opposite process has been carried through. There are villages where the redistribution is repeated regularly every year, others where this is only done as often as the number of legitimate sharetakers is increased or diminished. In some, to prevent the excessive parcelling of the land, a certain quota of the claimants are kept in abeyance at each term of allotment. To the reclaimer of virgin land belongs the ownership of the same. Details will be found in the official *Eindresume van het onderzock naar de rechten van den inlander op den grond*, of which an epitome appears in *De Indische Gids*, 1880.

Besides rice the Javanese cultivate for their own use, on a smaller scale, maize (*jagung*), ground nuts, yams, *Colocasia antiquorum*, *Coleus tuberosus*, and cassava. The gardens and orchards in which their huts are embowered contain a great variety of fruits. The cocoa-nut holds an increasingly important place,—the best of the many varieties being the idjo; and the banana is even more common. For an account of these as well as other fruits cultivated in the native orchards (*Artocarpus integrifolia*, etc.) see a paper by Gelpke in *De Indische Gids*, 1880.

The Javanese possess buffaloes, ordinary cattle, horses, dogs, and cats. Attempts made by the Government to introduce the ass (1841) and the camel (1843–45) were not successful. The buffalo was probably introduced by the Hindus. The ordinary cattle are of very mixed race; the Indian zebu having been crossed with the banting and with European cattle of miscellaneous origin. The horses, though small, are of excellent character, and their masters, according to their own ideas, are extremely particular in regard to purity of race. Riding comes very naturally to the Javanese; horse-races and tournays have been in vogue amongst them from early times. The native sheep are of no value for their wool, and the finest merinos, introduced by Holle in 1872, soon degenerated to the same condition.[1] Bees (apparently the small stingless *Melipona minuta*) are kept by the natives of the Preanger. The attempt to introduce the European varieties made in 1877–8 has proved very much of a failure. See Buitenzorg Report, 1879.

The production of rice is not of more importance to the native Javanese than the cultivation of the coffee-plant is to their European masters. The first coffee-plants grown in Java of which we have historical accounts were brought from Kananore on the coast of Malabar in 1696; but they perished in the earthquake and flood of 1699, and the honor of reintroducing the precious shrub belongs to Hendrik Zwaardekroon.[2] The first shipment of Javanese coffee to the Netherlands was made in 1711–12; but it was not till after 1721 that the yearly exports reached any considerable amount. The aggregate quantity sold in the home market from 1711 to 1791 was 2,036,437 piculs (of 133 ℔ avoird.), and this must have represented nearly the whole production of the island. By the beginning of the 19th century the annual production was 120,000 piculs, and in spite of political interruptions this had increased by 1825 to 268,000 piculs. After the introduction of the Van den Bosch system a further augmentation was effected; and from the official reports it appears that from 1840 to 1873 the amount has ranged from 769,000 to 1,234,000 piculs. During the ten years 1869–1878 the average annual produce of the Government plantations was 878,000, that of the private planters 156,000 piculs. In 1878 the actual quantity of Government coffee was 831,515 piculs, and it was estimated that the total number of full grown plants in the island was 14,180,000. The collecting warehouses were 367.

Next in importance to the coffee plant is the sugar cane. Between 1853 and 1857 the average production of Java was 1,652,112 piculs; between 1869 and 1873, 2,809,968; and between 1875 and 1880, 3,438,912; the corresponding numbers for Brazil being 1,683,200, 2,176,000, and 2,110,256. The largest harvest in any single year in Java during all that period was that of 1877, 3,721,984 piculs. The cultivation of tea, commenced by Du Bus, has also attained a considerable development; in 1879 the production amounted to upwards of 5,700,000 ℔. The plantations are private enterprises on lands leased or granted as freehold by the Government. Most of them are in Batavia (Depart. Buitenzorg) and the Preanger Regencies. Cinchona is largely grown by the Government, and to some extent by the private planters. In 1879 the Government had 1,678,670 trees; the production was about 115,000 ℔. Ten distinct varieties are in cultivation, *Succiruba* and *Calisaya javanica* preponderating. The tobacco plant is grown in nearly all the residencies, but most extensively in Kediri and Besuki. The production for the foreign market amounted in 1879 to 7,050,000 ℔.[3]

The cultivation of the great wealth-giving crops of Java has long been carried on in the interest of the Government, the native peasantry being obliged to devote so much of their soil and toil to satisfy the demands of their European masters. The system by which, in this regard, the relations of the Government to the native were for a long time determined is generally known as the "culture system." Introduced in 1830 by Van den Bosch, it continued in force till 1873, and has not altogether disappeared even yet. As far back as 1856 modifications of its arrangements were introduced by Duijmaer van Twist; and the position of the native was further improved by Sloet van de Beele. The reforms were for a time retarded by Governor Mijer; but in 1870, under the colonial minister Waal a new agrarian law was passed which permitted the cession of uncultivated ground to Europeans on a lease of seventy-five years. The principal object of the "culture system" was the coffee plant, and it is only gradually that the restrictions of the older regulation have been relaxed. In 1872 a new regulation was introduced into the Preanger Regencies; in 1875 it was extended to the rest of the island with the exception of Pasuruan and the Tenger mountains; and in 1877 it was made applicable in Pasuruan likewise. By this new system the large plantations at a distance from the abodes of the "culture" peasants are to be replaced by smaller plantations near the villages; no service is demanded from those whose lands and gardens are below a definite minimum, and the people cannot be called out for field work *en masse*; fifty coffee plants is the greatest number that any one can be called on to plant in a year. The general scope of the newer legislation is to leave as much as possible to private initiative, native and European, but it will be a long time before the leading strings can be altogether dropped. In the words of Mr. Kesteren:—

> "The Javanese knows no freedom. His whole existence is 'regulationed.' If he is bound to render 'culture-service,' the administration shows him to what department to apply himself, when and how he must plant. If he is not bound to render 'culture'-service, but has the position of a so-called free agriculturist, the administration prescribes the time and method of sowing and planting his land. If he wishes to fix his habitation outside his village, the village chief may prevent him. If he has a dwelling of his own, the administration decides for him what sort of materials he must use for the roof. If he has a hanging night lamp in his bamboo hut, he must not hang it against the wall."

It is not in the coffee plantations only that his service is demanded by the Government. In 1879 there were 2,030,-

---

[1] The number of buffaloes in Java (exclusive of Batavia, Surakarta, and Jokjokarta) in 1837 was 1,046,844; of cattle, 340,125; and of horses, 221,150. By 1876 the corresponding numbers were 2,235,613 buffaloes, 1,290,649 cattle, 532,612 horses. Since 1873 there are statistics for the whole island: in 1877 the buffaloes numbered 2,754,498; the cattle, 1,727,841; and the horses, 618,411. The cattle plague made its appearance in the island in 1879. See Kesteren, "De Veestapel of Java," in *De Indische Gids*, 1880.

[2] See N. P. van den Berg, "Voortbrenging ent Verbruik van Koffie" (*Tijdsch. voor Nijver. en Landb.*, 1879). Widji Kawah is mentioned in a Kawi inscription of 856, and "Bean-soup" is included in the list of Javanese beverages by David Tappen (1667–1682).

[3] In regard to coffee, sugar, cinchona, etc., see K. W. van Gorkom. *De Ost-Indische Cultures in Betrekking tot Handel en Nijverheid*, Amsterdam, 1881.

136 persons subject to the corvée; and the actual days of work required were 32,197,561, the greatest number of days which can be exacted from any individual being 52 per annum. To watch the Government warehouses, to escort prisoners, to keep the roads and bridges in repair, to give assistance to persons travelling in the public service, are some of the many tasks which the native is called on to perform.

Mechanic Arts.—In these the Javanese are in advance of the other peoples of the archipelago. Of thirty different crafts practised among them, the most important are those of the blacksmith or cutler, the carpenter, the kris-sheath-maker, the coppersmith, the goldsmith, and the potter. Their skill in the working of the metals is the more noteworthy as they have to import the raw materials. The most esteemed product of the blacksmith's skill is the kris; every man and boy above the age of fourteen wears one at least as part of his ordinary dress, and men of rank two and sometimes four. In the finishing and adornment of the finer weapons no expense is spared; and ancient krises of good workmanship sometimes fetch enormous prices.[1] The Javanese gold and silver work possesses considerable beauty, but there is nothing equal to the filigree of Sumatra; the brass musical instruments are of exceptional excellence. Both bricks and tiles are largely made, as well as a coarse unglazed pottery similar to that of Hindustan; but all the finer wares are imported from China. Cotton spinning, weaving, and dyeing are carried on for the most part as purely domestic operations by the women. The usual mode of giving variety of color is by weaving in stripes with a succession of different-colored yarns, but another mode is to cover with melted wax or damar the part of the cloth not intended to receive the dye. This process is naturally a slow one, and has to be repeated according to the number of colors required. As a consequence the "battiks," as the cloths thus treated are called, are in request by the wealthier classes. European imitations are easily detected, and do not pass muster; but a more rapid process of battiking by means of hand stamps has begun to be employed both by native and Chinese workers. For the most part quiet colors are preferred. To the Javanese of the present day the ancient buildings of the Hindu periods are the work of supernatural power. Except when employed by his European master, he seldom builds anything more substantial than a bamboo or timber frame work; but in the details of such erections he exhibits both skill and taste. When Europeans first came to the island they found native vessels of large size well entitled to the name of ships; and, though shipbuilding proper is now carried on only under the direction of Europeans, boat-building is a very extensive native industry along the whole of the north coast—the boats sometimes reaching a burden of 50 tons.

The only one of the higher arts which the Javanese have carried to any degree of perfection is music; and in regard to the value of their efforts in this direction Europeans differ greatly. The orchestra (*gamelan*) consists of wind, string, and percussion instruments, the latter being in preponderancy to the other two. (Details on the instruments will be found in Raffles, and a description of a performance in the *Tour du Monde*, 1880.) In connection with this attention may be called to the wayangs or puppet plays, in which grotesque figures of gilded leather are moved by the performer, who recites the appropriate speeches, and as occasion demands plays the part of chorus. At least one Javanese, Raden Saleh, has attained eminence as a painter.

Population.—The data for tracing the increase of the population are far from satisfactory; and the returns even of the present time can only be accepted as rough approximations.[2] Of the following tables the first gives the totals for Java and Madura for several years, and the second the details for the individual provinces at December 31, 1878, according to the *Koloniaal Verslag* of 1880.

	Europeans.	Chinese.	Arabs, etc.	Natives.
1868	28,466	167,620	15,712	15,265,931

Madura	...	484	3,790	1,541	779,478	785,293
Total		29,998	200,303	9,610	18,824,574	19,067,829

The population has thus increased considerably since 1872, when the return showed a total of 17,291,200. The most densely peopled districts (those occupied by the Javanese proper) have a greater number of inhabitants to the square mile than Belgium; the Sunda lands,[4] on the other hand, and the Madurese districts have in comparison a sparse population.

The Government returns furnish the population of only the three largest towns. At the close of 1878 Batavia (town and suburbs) contained 97,585 inhabitants, of whom 4427 were Europeans, 23,466 Chinese, 68,822 natives, and 890 Arabs, etc.; the numbers for Samarang (total 79,443) were Europeans 2976, Chinese 7088, natives 66,691, Arabs, etc., 2688, and for Surabaya (total 118,824), Europeans 4471, Chinese 6293, natives 106,599, Arabs, etc., 1461. It thus appears that in respect of population Batavia is only second. The great bulk of the population is distributed over the country in villages usually called by Europeans dessas, from the Low Javanese word *désâ* (High Javanese *dusun*).[5]

Every dessa, however small (and those containing from 100 to 1000 families are exceptionally large), forms an independent community; and no sooner does it attain to any considerable size than it sends off a score of families or so to form a new dessa. Each lies in the midst of its own area of cultivation. The general enceinte is formed by an impervious hedge of bamboos 40 to 70 feet high. Within this lie the houses, each with its own enclosure or garth, which, even when the fields are the communal property, belongs to the individual householder. In the centre of the alun-alun or forum there is usually a giant waringin or tjaringin tree (*Urostigma benjaminum*), and on the west side stands the mosque. The capital of a district is only a larger dessa, and that of a regency (in Sundanese *dayuh*, in Low Javanese *negårå*, hence the familiar *negerie*) has the same general type, but consists of several kampongs or villages. The houses in the strictly Javanese districts are always built on the ground; in the Sunda lands they are raised on piles.

---

[1] The reader will find drawings of a great variety of kris blades in Raffles, *Java*, vol. i.

[2] In 1781 Radermacher estimated the population of Java at 2,029,915 souls; in 1795 Nederburg gave it as at least three and a half millions, and Daendels in 1808–1811 as over 3,770,000. It was certainly not on the side of excess that these estimates erred. About 1815 the first real census of the population, carried out by Raffles, gave an aggregate of 4,615,270—Java 4,390,661, and Madura 224,609—of whom 4,499,250 were natives. According to Bleeker's estimate (*Tijdschr. voor Nederl. Indië*, 1847), the total about 1845 was 9,542,045, of whom 9,373,989 were natives. The only year since 1849 in which, according to the official returns, there has been a decrease in the population is 1850, due to the famine and pestilence that prevailed in Demak and Grobogan. There appears to be about the same preponderance of male over female births in Java as in Europe.

[3] These areas are the result of the Government survey begun in 1854. See Havenga, *Aperçu de l'origine et du dévelop. des reconn. mil. à Java* (Bat., 1878).

[4] That is, the residencies of Bantam, Batavia, Krawang, Cheribon, and the Preanger Regencies.

[5] This is really a Sanskrit word, known also in British India in the compounds *desai* (*i. e.*, desadhipati). *desmukh* (*i. e.*, desa-mukha), equivalent to village chief. The Sundanese quasi-equivalent is *lembur*, and several lemburs or kampongs compose a kalurahan or lurah-ship.

Administration.—The principal local European authority is known as the *resident*, who exercises judicial, financial, and administrative functions. As president of the council (*landraad*) and judge of the residency court he deals both with civil and with criminal cases; and he also acts as police magistrate in his more immediate district. Each of the *assistant residents* administers under his supervision one of the territorial departments (*afdeelings*) into which each residentship is divided. Next in rank is the European secretary of the resident, who, as occasion demands, acts as the resident's substitute as president of the council, and performs a great variety of duties as recorder, notary public, registrar, etc. Subject to the assistant resident is the controller. "It is his first duty to look after the interests of the native population, and he may be considered as the link that connects the European with the native functionaries." His district is of so limited an extent that he is able to make a personal inspection of every portion of it once a month. and to become intimately acquainted with all the native officials within its boundaries. There is almost nothing which can be considered as affecting either the welfare of the population or the success of the Government administration which lies beyond the scope of his supervision. At the same time he is entrusted with a very small share of executive authority; his function is to observe, to advise, to report. Under the perpetual guidance of these residents, assistant residents, and controllers, a large part of the administration of the country is carried on by the native functionaries. Of these the highest is the *regent*, whose rank and right of precedence is superior even to that of all European officials below the resident. Always belonging to one of the ancient noble families, he maintains the state and retinue of an independent prince, with all the elaborate environment of Oriental etiquette. He receives a large salary from the Dutch Government, possesses, in virtue of his office, a landed estate, and exercises large authority over the people of his regency. By the European officials also he is treated with full respect and consideration. But, appointed by the governor-general, he, as much as any ordinary official in the civil service, holds his office by the good-will of the Dutch Government. Insubordination is followed by dismissal; and dismissal involves the forfeiture of all the wealth and prestige which he possessed as regent. The regent's substitute is known as *pattih*. The several districts of the regency (there are usually five or six) are administered by a *wedånå* (*wedono*) or *demang*; and secondary subdivisions by *assistant wedånås* or *mantris* (salaried). The wedånå has also at his disposal a considerable number of volunteer mantris not officially recognized.[1]

The following table shows the residentships and departments into which Java (with Madura) is divided:—

Bantam:[2] Anyer, Pandeglang, Tjiringin, Lebak.
Batavia: Batavia (town and suburbs), Meester-Cornelis, Tangerang, Buitenzorg.
Krawang: two control departments.
Preanger Regencies: Bandung, Tjitjalengka, Tji Andjur (Tjandjur), Sukabumi, Sumedang, Tasik-malaya, Limbangan, Sukapura, Sukapura-kolot.
Cheribon: Cheribon, Indramayu (Dermayu), Galuh, Madjalengka, Kuningan.
Tagal: Tagal (Tegal), Brebes, Pemalang.
Pekalongan: Pekalongan, Batang.
Samarang: Samarang (Semarang), Salatiga, Ambarawa (Embah-rowo or Bahrowo), Unarang (Oenarang), Demak, Grobogan, Kendal.
Japara: Japara (Djepara), Kudus, Joana (Juwana), Carimon Java (Karimun Djawa).
Rembang: Rembang, Tuban, Bodjo-Negoro, Blora.
Surabaya: Surabaya, Grissee (Gresik), Modjokerto, Sidoardjo, Sidayu, Lemangan, and the island of Bawean.
Madura: Pamekasan, Madura, Sumanap (Sumenep), Sampang.
Pasuruan: Pasuruan, Malang, Bangil.
Probolingo: Probolingo, Kraksaan (Kareksan), Lumadjang.
Besuki: Besuki, Panarukan Bondowoso.
Banyuwangi: Banyuwangi, Buleleng, and Jembrana (the last two in Bali).
Banyumas: Bányumas, Tjilatjap, Purwokerto, Purbolingo, Bandjernegara.
Bagelen: Purworedjo, Kutoardjo, Ledok (Wonosobo), Kebumen, Karanganyer.
Kadu (Kedu): Magelang, Temanggung.
Jokjokarta: Sulans territory, with eight regencies, and Paku Alams territory, forming one regency.
Surakarta: Surakarta, Sragen, Boyolali, Klaten, Wonogiri.
Madiun: Madiun, Ngawi, Patjitan, Ponorogo, Magetan.
Kediri: Kediri, Ngrowo, Berbek, Blitar.

There are thus (excluding the governor-general) 22 residents and 73 assistant residents. The normal number of controllers is 100, and of aspirant controllers 48, there being no controllers in Batavia, Jokjokarta, or Surakarta.

Chief Towns.—The principal town of the residency of Bantam is *Serang* (6° 6′ 45″ S. lat. and 106° 8′ 37″ E. long.), bearing the same relation to the town of Bantam (about 6 miles distant) as New Batavia bears to Old Batavia. It is only 100 feet above the sea-level, but even this elevation renders the climate much better for Europeans than that of Bantam, and it is owing to this that Serang has come to supplant the older city. For BANTAM, see vol. iii. p. 299. *Anyer* lies on the coast at the narrowest part of the Sunda Straits, and vessels from Europe usually receive fresh provisions and water there. *Pandeglang* is 787 feet above the sea; in the vicinity are sulphur springs, both hot and cold.

BATAVIA, the capital of Dutch India, has already been described in vol. iii., p. 372.[3] *Meester Cornelis*, between 6 and 7 miles from Batavia on the way to Buitenzorg, was the seat of a fort as early as the time of Valentijn. It was there that Daendels established his great entrenched camp, and it was there that the battle was fought (in 1811) which placed Java in the hands of the British. About 14 miles from Batavia lies *Tangerang*, a small but busy place, with several thousand Chinese amongst its inhabitants. In its vicinity is Bergzicht (Berzigt), formerly famous for its indigo. For BUITENZORG, see vol. iv., p. 461.

The Krawang residency is one of the least populous in the whole island. The great post road does not enter the territory; the resident has less direct authority over his district than is enjoyed by his official compeers, and has no assistant resident. *Krawang*, the old capital, has lost its importance since *Purwakarta* became the administrative centre. This place, laid out by the commissioner Du Bus, has a large native and Chinese population. At Wanayasa, a considerable negårå, the first tea gardens on a large scale were attempted on the island.

The Preanger Regencies (Bandung, Tjandjur, Sumedang, Limbangan, Sukapura) constitute the most important of all the residencies. *Bandung*, the capital of the residency since 1864, is a flourishing place, with a handsome mosque, and normal school for native teachers. *Tji Andjur*, which was the administrative centre up to 1864, is of similar character to Bandung, though the removal of the resident and his subordinates has produced a certain decline in its importance. *Tjitjalengka*, in the very heart of the coffee districts, has developed greatly since the new system was introduced in 1870, and is certain to make further progress when the projected railways give it better communication with Bandung and Batavia. *Sumedang* is already a populous and prosperous negårå. The ancient settlement of this name lay in another part of the regencies.

Cheribon (Tjeribon) is one of the most important places in Java, though the unhealthiness of the site has caused a number of the principal Europeans to settle about 2 miles to the north at Tangkil. The church erected in 1842, the regent's residence, large warehouses for coffee and salt, and a prison are among the principal buildings. The native part of the town is to some extent laid out in European style. The Chinese quarter, large and populous, possesses the finest Chinese temple in Java. Cheribon is the residence of the descendants of the old sultan of Cheribon. The palaces are not so extensive as those of Surakarta and Jokjokarta. By the mud bank at its mouth, the Tjeribon (Shrimp River) does more harm than good to the town. The harbor is only kept available by constant dredging, but the roadstead is very good all the year round. A strange pleasure palace of Sultan Sepuh, frequently described by travellers, lies about 2 miles from Cheribon near Sunya Raja. *Mundu*, a village 4 miles southeast of Cheribon, is remarkable as the only spot on the north coast of Java which is visited by the *ikan prut* or belly fish, a species about as large as a cod, caught in thousands, and salted by the local fishermen. *Indramayu* lies on both sides of the Tji Manuk, about 8 miles from the coast. It is mentioned as Dermayo in the old Portuguese and Dutch travels. As a port for the rice of the district of Indramayu, and for the coffee of the Preanger and Cheribon, the town seemed at one time to have a great commercial future before it, but the roadstead was safe only during the east monsoon. The river has a tendency to send its waters by the channel of the Kali Rambatan, and a process of silting up is going on rapidly. In 1876 the Government began the construction of works to prevent the change of course.

---

[1] See further in J. W. B. Money's *Java*, London, 1861.

[2] The correct form of this name, Banten, is getting into use in Dutch works.

[3] A plan of the town will be found in *Jaarboek van het Mijnwezen*, Batavia, 1880.

Tagal has long been one of the chief towns in Java,—foreign commerce, and native trade, industry, and fisheries, being all well developed. About 1845 Dr. Bleeker estimated its population at 29,536, and, if the growth of the town has been similar to that of the residency, the total may now be set down as about 80,000. Since 1871 the harbor has been the object of various improvements. The town is regularly and well built. The native stone-cutters, carpenters, dyers, and smiths of Tagal are particularly skilful. *Pamalang* is a thriving coast village, noteworthy for the quality of the oysters. *Pekalongan* ("abode of the kalongs") is, like Tagal, an important town. It possesses a large mosque, a Protestant church, a fort (now used as a prison and barracks), and a large number of European houses. The Chinese ward consists of neat stone or brick buildings. Dr. Bleeker estimated the population at 15,000 in 1848; it must be now considerably more. The name of Pekalongan is associated with the smoked ducks prepared in the district. *Batang* is only 5 miles distant.

Samarang lies on the Kali Ngaran near the centre of the north coast. Round the market place are grouped the residences of the regent and his substitutes, the mosque, the military hospital, the town-house (erected in 1854–1864), the Government warehouses, etc. The hospital, formerly the palace of the governor of the northeast coast, has accommodation for 550 European patients. The town was formerly surrounded by a wall and ditch, but these were removed in 1824, and it is now protected by a fort and a coast battery. The old European portion of the town is almost the exact reproduction of a Dutch town, without the slightest accommodation to the exigencies of the climate. A new impulse was given to Samarang by the opening of the railway to Surakarta and Jokjokarta (1873). As a seaport, the place is unfortunately situated; the river is long since silted up; the roads are insecure during the west monsoon; it was only after many delays that in 1879 the artificial canal, commenced in 1858 as a substitute for the river, became available; and in the opinion of the Government commission of 1876 it would be useless to attempt the erection of works similar to those of Batavia. *Demak*, the chief town of a regency famous in the ancient Javanese history, lies 13 miles northeast of Samarang. The mosque, erected by the first sultan of Demak, was rebuilt in 1845, and only a small part of the old structure has been preserved; but the tombs of several of the sultans are to be seen near at hand. *Salatiga* (that is, "Three Stones," with allusion to three temples now destroyed) was in early times one of the regular resting-places for ambassadors proceeding from the coast to the court of Mataram; and in the European history of Java its name is associated with the peace of 1755 and the capitulation of 1811. It is the headquarters of the only regiment of cavalry in the Dutch East Indian army. Besides the garrison, the European population numbers some 400 or 500 persons. About the same number of Europeans are settled at *Ambarawa*, which consists of the contiguous villages Pundjang, Ambarawa, Losari, and Kupang, and lies about a mile north of the fortress Willem I., which Van den Bosch intended to make the central point of the Javanese system of defensive works. *Ungaran* (1026 feet above the sea) was a place of importance as early as the time of Valentijn, and in modern times has become known as a sanitarium.

Japara was in Valentijn's days one of the most flourishing of the Javanese coast towns; and it was still a place of prosperous commerce during the British occupation; but the harbor has greatly deteriorated, and the town is declining. *Joana* has a strikingly Dutch appearance; it is often mentioned in the early narratives. *Kudus* is a place of more than 14,000 inhabitants. *Rembang*, a well-built town, contains a considerable European settlement and a number of European institutions; the population exceeds 10,000.

Surabaya, as already mentioned, is the largest town in Java, and ranks next to Batavia in the variety of its religious, educational, charitable, and commercial institutions. It owes this position to the fact that its harbor is the best in the island. Since 1849 it has been the seat of Government dockyards and arsenals; and there are also extensive barracks, a military hospital, etc. The population includes Javanese, Madurese, Indians from Bengal, Moors, and Chinese. *Grissee* (Gresik) has a fairly good harbor, and is of special interest in the early European history of Java. *Pasuruan* ranks as the fourth town in the island; it is well built, and has a considerable European settlement. *Probolingo* (called by the natives Banger), *Besuki*, and *Banyuwangi* are all prosperous places of from 7000 to 15,000 inhabitants. The residency of Banyuwangi is one of the least opened up of the whole island. *Banyumas* contains a population of about 10,000 inhabitants, but there are no objects worthy of particular notice. The name, equivalent to "gold-water," was bestowed by its founder Aryå Sureng Rånå from the auriferous character of the river Serayu on which it stands. *Tjilatjap*, though not the capital of the residency, is a much more important and interesting place. It possesses the best harbor of all the south coast, situated at the mouth of the canal Kali Sesukan, which runs between the Serayu and the sea, and protected by the island of Nusa Kambangan; and it has been chosen as the seat of a principal military establishment. A battery was erected close to the town in 1878, and on Kambangan lie the forts Karang Bolong and Batu Njapa. The pile-villages of the Segara Anakan (as the enclosed bay is called) and the stalactite and mephitic caves of the island are objects of much interest. *Purworedjo*, the chief town of Bagelen,[1] became of some importance during the Java war as a military establishment, and is still occupied by a considerable garrison. It is laid out in a spacious style; and both the native and the Chinese quarters are well kept. The population is large, and it is an important seat of native industry.

Very similar to each other are *Surakarta* and *Jokjokarta*, the chief towns of the independent states. The former contains the palace of the susuhunan or emperor, the residence of the independent prince Mangku Negoro, the fort of Vastenburg, a Protestant church, and a considerable number of European buildings.

Inhabitants.—Leaving out of view the Europeans and the Oriental immigrants—scarcely a seventh part of the population—the inhabitants of Java consist of the Javanese proper, the Sundanese, and the Madurese. All three belong to the Malay stock. Between Javanese and Sundanese the distinction is mainly due to the influence of the Hindus on the former and the absence of this on the latter. Between Javanese and Madurese the distinction—not so deeply wrought—is rather to be ascribed to difference of natural environment. The Sundanese have best retained the Malay type, both in physique and fashion of life. They occupy the five residencies of Bantam, Batavia, Krawang, Cheribon, and the Preanger Regencies. The limits of the Madurese area are not so easily given. Besides the island of Madura, the residencies to the east of Surabaya and Kediri are largely occupied by them. The residencies of Tagal, Pekalongan, Banyumas, Bagelen, Kadu, Samarang, Japara, Surakarta, Jokjokarta, Rembang, Madium, Kediri, and Surabaya have an almost purely Javanese population. Professor Veth estimates the number of the Sundanese at about 4,000,000, the Madurese at 1,600,000, and the Javanese at 11,500,000. The Javanese are the most civilized of the three peoples.

The color of the skin in all three cases presents various shades of yellowish-brown with a touch of olive-green; and it is observed that, owing perhaps to the Hindu strain, the Javanese are generally darker than the Sundanese. The eyes are always brown or black, the hair of the head black, long, lank, and coarse. Neither breast nor limbs are provided with hair, and there is hardly even the suggestion of a beard. In stature the Malay is usually less than the European. The Sundanese is less than the Javanese proper, being seldom 5 feet in height; at the same time he is more stoutly built. The Madurese is as tall as the Javanese, and as stout as the Sundanese. The eye is usually set straight in the head in the Javanese and Madurese; among the Sundanese it is often oblique. The nose is generally flat and small, with wide nostrils; but among the Javanese it not unfrequently becomes aquiline. The lips are thick but well formed; the teeth are naturally white, but often filed and stained. The cheek bones are well developed, more particularly with the Madurese. In expressiveness of countenance the Javanese and Madurese are far in advance of the Sundanese. The women are not so well made as the men, and among the lower classes especially soon grow absolutely ugly. In the eyes of the Javanese a golden yellow complexion is the perfection of female beauty:—"She shone bright even in the dark" is the highest compliment of poetic adulation (compare Raffles, *Java*, vol. i. p. 92). To judge by their early history, the Javanese must have been a warlike and vigorous people, with somewhat of ferocity to boot. At present they are peaceable, docile, sober, simple, and industrious. The practice of running amuck is of very rare occurrence among them.

---

[1] The village from which the residency takes its name is situated in the district of Tjangkreb in the Purworedjo regency. It is so called from a "linga" pillar still reverenced by the natives,

Religion.—The Javanese are nominally Mahometans, as in former times they were Buddhists and Brahmans; but in reality, not only such exceptional groups as the Kalangs of Surakarta and Jokjokarta and the Baduwis or nomad tribes of Bantam, but the great mass of the people must be considered as believers rather in the primitive animism of their ancestors, and in the essence of their creed but little removed from their ruder brethren the Dayaks of Borneo and the Battaks of Sumatra. Into the original web indeed they have from time to time introduced fragments from every religious system with which they have come into contact; and no attempt has been made to rationalize into even superficial harmony the rudest of the resulting incongruities. The number of the spirits (Hyang or Yang, and with honorific prefix Sanghyang) worshipped by the Javanese is limitless. Every village has its patron spirit, whose presence was the indispensable condition of its foundation; to his influence all the fortune, good or bad, of the village is ascribed. Under a great shadowy tree stands an altar on which the worshipper lays his offering of incense and flowers, uttering meanwhile in broken Arabic the alien formula—"There is no God but God, and Mahomet is his prophet." To every field likewise belongs its special patron spirit, to whom due reverence must be shown. Nor is protection the only office of the Hyang. Mentik causes a particular disease in the rice; Sawan produces convulsions in children; gout and rheumatism are ascribed to the influence of Dengen; Ki or Kyai Belorong gives men wealth in exchange for their souls. Ratu Loro Kidul is princess of the southern sea, and has her seat among the caves and fiords of the southern coast. Within the region of her sway the Javanese will not speak loud lest he disturb the repose of her subject spirits. Near Rongkob in Jokjokarta, one of the places where edible nests are collected, the princess has a temple which none may enter save the priest alone; and similar temples exist in similar localities. The whole life of the Javanese, indeed, is enveloped in a mesh of mystery; not the stars only and the heavens rain influence, but from every object a spiritual emanation, invisible for the most part, but potent and exhaustless, flows forth to him for blessing or for curse. Even Mahometanism with its One God has done little more than increase the number of supersensual beings to whom he prays. To Joseph he presents offerings that he may obtain beautiful children, to Solomon for honor and rank, to Moses for bravery, to Jesus for learning. The ritual of his religion—and his whole round of life is part of his religion—is intricate almost beyond conception, and at the same time rigid and precise. Everything must be done by rule and rubric; the unwritten law handed down from father to son allows of no curtailment or modification. Each individual class of offering must be prepared in its own peculiar way; the rice, for example,—which is one of the chief sacrificial substances,—must now be white, now red, now hard, now soft.

As we ascend in the social scale we find the name of Mahometan more and more applicable; and consequently in spite of the paganism of the populace the influence of the Mahometan "priests" (this is their official title in Dutch) is widespread and real. Great prestige attaches to the name of Mecca pilgrim. In every considerable town there is a mosque. Compare INDIAN ARCHIPELAGO, vol. xii. p. 859.

For the Christianizing of the Javanese very little has been done. In East Java the chief mission stations are Modjo Warno (with a population of 2327 souls in 1879, inclusive of seven out-stations, Kediri (698), and Malang (700), maintained by the Netherlands Missionary Society, and Japara maintained by the Dutch Baptist Society. In West Java the Netherlands Mission Union has seven stations—Tjandjur, Buitenzorg, Indramayu, Sukabumi, Sumedang, Madjalengka, and Cheribon. At Depok, 18 miles from Batavia, the Batavian Missionary Society established in 1878 a seminary for native preachers. The native church of Depok was originated by Cornelis Chastelein, who left his estate to his slaves, whom he liberated on condition of their embracing Christianity. Mr. Brückner of Samarang, appointed to Java in 1812 by the Netherlands Society, translated the New Testament into Javanese, but the work was confiscated by the Government. Gericke, an agent of the Netherlands Bible Society, was more fortunate; his versions of both the Old and the New Testament, as well as his grammar and dictionary (edited by Roorda, Amst., 1843, 1847), have seen more than one edition.[1]

Language and Literature.—Javanese, Sundanese, and Madurese are the three native languages of Java and Madura. To take the least important first,—Sundanese is only spoken in its purity in the Preanger Regencies and the neighboring parts of Bantam, Buitenzorg, Krawang, and Cheribon, and it is gradually losing ground. To Javanese it stands in the relation that Scotch stood to English about a century ago.[2] The main body of Madurese is distinctly different from both old and new Javanese; but it has incorporated a very large number of purely Javanese words.[3] In spite of these two languages and the intrusive Malay, Javanese has a full right to its name as the dominant speech of the island. It is not one language, but two. The nobles speak to the commonalty in the language of the commonalty, the commonalty to the nobles in the language of the nobles; and according to clearly understood regulations of etiquette every Javanese plays the part of nobleman or commoner to his interlocutor. The aristocratic form is known as *Krâmâ* or court speech, the popular as *Ngoko*, or the "thou-"ing speech (Fr., *tutoyant*, Germ., *duzend*); and between the two forms there is a sort of compromise, the *Madja* or middle speech, employed by those who stand to each other on an equal and friendly footing, or by those who feel little constraint of etiquette. For every idea that can be expressed in the language Krâmâ has one expression, Ngoko another, the two words being sometimes completely different, sometimes only differing in the termination, the beginning, or the middle. Thus every Javanese makes use of two languages, and, what is more difficult, of two languages delicately differentiated from each other. Javanese as now spoken is far from being the same as the language of the old inscriptions and manuscripts. The latter (which is usually called Kawi,[4] though some scholars insist on the name Old Javanese) was probably based on the Javanese of Mâdjâkerto, while the Krâmâ of the present day finds its type in that of Surakarta. It is easy to explain the existence of the Krâmâ and the Ngoko. The Hindu conquerors of Java, in gradually adopting the speech of their Malay subjects modified it to suit their own taste and sense of superiority; and the subjects meanwhile continued to speak as they were wont. In its vocabulary Javanese Krâmâ has a large number of words of Sanskrit origin; and in modern times there has been a considerable adoption of foreign words from and through the Dutch. Krâmâ usually takes one form, Ngoko another; thus the word *particulier* appears in the former as *pedjahkelir*, in the other as *patikelir*.[5] Like all the alphabets of the Indian archipelago except the Malay, the Javanese is derived from the Devanagari. When Javanese is written in Arabic characters it is called pégon.

[3] See A. C. Vreede, *Handleiding tot de beoefening der Madoeresche taal*, Leyden, 1874.

[4] In full form tembung or båså Kawi, *i.e.*, the "language of poems."

[5] Humboldt's study, *Ueber die Kawi Sprache*, is one of the celebrated works of modern philology; but in the absence of the necessary material it was to some extent a *tour de force*. Professor Kern's *Kawi Studien* form the most important of the more recent contributions to the investigation of the language. For modern Javanese the standard grammar is Groot and Gericke's *Javaasche Spraakkunst*, edited by Roorda (Amst., 1843).

Though a considerable body of Kawi literature is still extant, nothing like a history of it is possible. The date and authorship of most of the works are totally unknown. The first place may be assigned to the *Brata Yudu* (that is Sansk., *Bharata Yudha*, the conflict of the Bharatas), an epic poem dealing with the struggle between the Pandåwås and the Koråwas for the throne of Ngastina celebrated in parwas 5–10 of the Mahâbhârata. To the conception, however, of the modern Javanese it is a purely native poem; its kings and heroes find their place in the native history and serve as ancestors to their noble families. (Cohen Stuart published the modern Javanese version with a Dutch translation and notes, *Bråtå-Joedå*, etc., Samarang, 1877. The Kawi text was lithographed at the Hague by S. Lankhout.) Of greater antiquity probably is the *Ardjunå Wiwåhå* (or marriage festival of Ardjuna), which Professor Kern thinks may be assigned to the first half of the 11th century of the Christian era. The very name indicates its Mahâbhârata origin. (Friederich published the Kawi text from a Bali MS., and more recently we have from him *Wiwåhå Djarwa en Bråtå Joedo Kawi*, lithographed facsimiles of two palm leaf MSS., Batavia, 1878. Djarwa is the name of the poetic diction of modern Javanese.) The oldest poem of which any trace is preserved is probably the mythological *Kåndå* (*i.e.*, tradition); the contents are to some extent known from the modern Javanese version.

In the literature of modern Javanese there exists a great variety of so-called *babads* or chronicles. It is sufficient to mention the "history" of Baron Sakender, which appears to give an account—often hardly recognizable—of the settlement of Europeans in Java (Cohen Stuart has published text and translation; Professor Veth gives an analysis of the contents), and the *Babad Tanah Djawi* (Hague, 1874, 1877), giving the history of the island to 1647 of the Javanese era. Even more numerous are the puppet-plays which usually take their subjects from the Hindu legends or from those relating to the kingdoms of Madjapahit and Padjadjaram (see, *e.g.*, H. C. Humme, *Abiåsd, een Javaansche toneelstuk*, Hague, 1878).

Several Javanese specimens are also known of the beast fable, which plays so important a part in Sanskrit literature (W. Palmer van den Broek, *Javaansche Vertellingen, bevattende de lotgevallen van een kantjil, een reebok*, etc., Hague, 1878.) To the Hindu-Javanese literature there has naturally succeeded a Mahometan-Javanese literature consisting largely of translations or imitations of Arabic originals; it comprises religious romances, moral exhortations, and mystical treatises in great variety.

The reader may consult Rodet, *Études sur la littérature javanaise;* Van der Berg's account of the MSS. of the Batavian Society, Hague, 1877; and a series of papers by C. Poensen in *Meded. van wege het Ned. Zendelinggenootschap*, 1880.

Antiquities.—The ruins left by the early Hindu conquerors of Java are among the most remarkable objects of interest throughout the island. Temples (or *tjandis*, to use the Javanese name) are common in both middle and eastern Java,—in Banyumas, Bagelen, Kadu, Jokjokarta, Surakarta, and Samarang, and in Surabaya, Kediri, Pasuruan, and Probolingo. They are absent from the Sunda lands in the one direction and from Madura in the other.

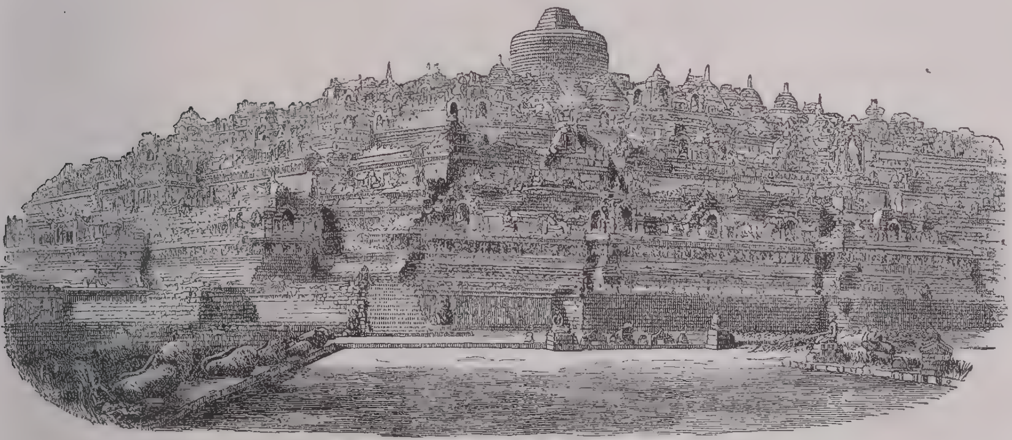

Fig. 1.—General View of Bårå-Budur.

Most famous of all the temple ruins is that of Bårå-Budur, It lies a little to the west of the right bank of the Prågå, which falls into the Indian Ocean. A hill rising above the plain 154 feet afforded a ready site for the structure, and the lava blocks with which the ground was strewn supplied abundance of material. The accompanying view and ground plan will give some idea of the general arrangement and effect.[1] A square terrace, each side 497 feet long, encloses the hill at a height of 50 feet; 5 feet above this there is a second terrace, each side 365 feet; 11 feet higher comes a third terrace of similar shape; and then follow four other ramparts and four other terraces. The whole structure is crowned by a cupola 52 feet in diameter, surrounded by sixteen smaller bell-shaped cupolas. It is suggestive of the richness of the style to mention that on the outside of the wall of the second enceinte there are one hundred and four niches, each with its image of Buddha on a lotus throne hewn out of a single block 5 feet high; and between the niches are sitting figures, man and woman alternately. The inside of the same enceinte is even more richly adorned with at least five hundred and sixty-eight bas-reliefs, representing scenes in the Buddha legend. Of the chronological date of the temple there is no certain knowledge, but it contains evidence enough in itself to fix its position in the historical movement of the Hindu creeds.

> "The mixture of Buddhism and Brahmanism is best seen," says R. Friederich (*Tijdsch. der Ind. T. L. en Volkenkunde*), "in the three upper and inner galleries of Boro Budur. In the first we see the history of Sakyamuni from the annunciation of his descent from the heaven of Indra till his transformation into Buddha, with some scenes of his life. The thirteen first scenes in the second gallery likewise represent Buddha as a teacher with his pupils; after that it would seem as if a concordat had been formed between the different cults; we have first in three separate scenes Buddha, Vishnu (Batara Guru), and Siva, all together, and other groups follow, Buddhistic and Sivaite without distinction. It is only in the fourth gallery that we again find Buddha dominant. . . . Already in the first gallery we also see Brahmanic divinities, Garonda for example, but not in separate scenes. In my opinion the cupola is the principal and the most ancient part of the temple of Boro Budur; it must have been intended to serve as a dahagopa (dagoba), *i.e.*, a place for the enshrining of relics. I do not as yet know of any other dagoba in Java; but I should not be surprised at their discovery. The dagobas of Ceylon have an exterior resemblance to the Boro Budur cupola; but I prefer to classify it rather with the topes or stupas of Afghanistan."

The writer goes on to point out that the sculptures of the lower galleries are not so carefully finished; and the lions and some other subjects on the outside of the temple have never been completed. About 3 miles to the north-east of Bårå Budur, and probably belonging to the same period, stands another beautiful temple—Tjandi Mendut or Mundut—on the left bank of the Ellâ before it joins the Prâgâ. It was first discovered by Hartmann, the resident of Magelang, in 1834, under the sand and ashes with which the Merapi volcano had covered it. See C. W. Mieling's *Javasche Oudheden*, 1852 and 1856; and Colonel Yule's account of his visit in *Journ. Roy. As. Soc. Bengal*, 1862.

---

[1] See Leeman's *BôròBoedoer*, based on the MSS. of Wilsen and Brumund, and accompanied by 394 plates on elephant folio, Leyden, 1873.

On the Dieng plateau in Bagelen, mentioned as a holy mountain in the oldest known Javanese inscription, there exists a remarkable group of temples—which has been styled the Benares of Central Java. They stand 6500 feet above the sea; and roads and stairways (locally known as Buddha's roads) lead up from the lowlands of Bagelen and Pekalongan. The stairway between Lake Mendjer and Lake Tjebong alone consisted of upwards of 4700 steps. A great subterranean channel served to drain the plateau. The Tjandis are very numerous, the largest and most beautiful being Tjandi Bimâ, but the best preserved the Ardjunâ group. The buildings are unfortunately covered to about a third of their height. In the same residency as Dieng are situated the temple caves of Kutâ Ardjâ discovered by Kinder in 1853. They are distributed in four groups, and apparently from the linga symbol belong to the worship of Siva. Near Râjâ Djampi (Banyuwangi) are the ruins of the town of Matjan Putih—of astonishing extent, but for the most part only shapeless mounds. The town walls were 12 feet high and 6 feet broad. A temple built of white limestone is the chief ruin. It seems to belong to the late Siva period of Javanese Hindu art. The much more famous city of Mâdjâpahit has left its ruins not far from Mâdjâkerto, in Surabaya.

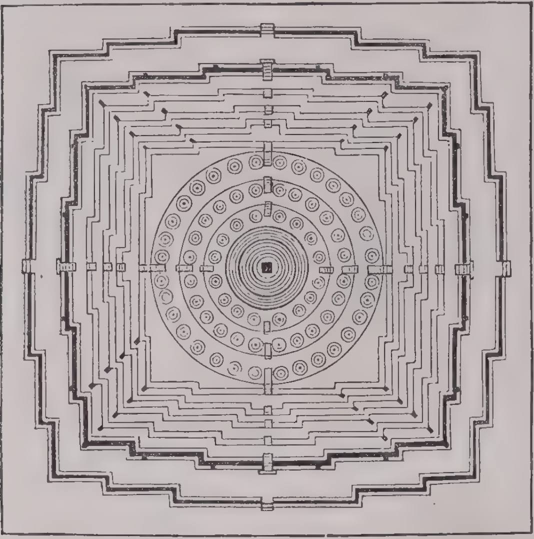

FIG. 2.—Ground Plan of Bârâ-Budur.

Of the minor antiquities of Java the most valuable are the inscriptions on stone and copper, though, owing to the variety of the characters which have been employed, the task of deciphering and interpreting is peculiarly difficult. The proposal of the Batavian society in 1843 to issue a *Corpus* of Javanese inscriptions came to nought; of private investigators the most successful are Friederich and Kern. The inscriptions of Batu Beragung (1347, and Payerrayung (1356), that on an image of Buddha now in the Berlin Museum, that on a rock in the Dieng mountains discovered by Junghuhn, and that preserved at Minto House, in Scotland, are considered of special importance. At Sukuh and Tjeta, on the slope of Lawu, there is a peculiar series in a special character deciphered by Van der Vlis. The famous Menang Kebau inscriptions, being the work of Javanese settlers, belong rather to Java than Sumatra; but Professor Kern has shown that, instead of being, as at one time supposed, the oldest epigraphic monument in the Archipelago, they really belong to the most modern Hindu period (*cf.* Cohen Stuart in *Bijd. tot de T. L. en V. Kunde*, viii. 1, 1873). Of the Javanese copper plates the most important collection is Cohen Stuart's *Kawi Oorkonden in Facsimile*, 1875.

The Name Java.—The origin of this name is very doubtful. It is not improbable that it was first applied either to Sumatra or to what was known of the Indian archipelago—the insular character of the several parts not being at once recognized. Jawa Dwipa, or "land of millet," may have been the original form[1] and have given rise both to the Jaba diu of Ptolemy and to the Je-pho-thi of Fattien, the Chinese pilgrim of the 4th or 5th century. The oldest form of the name in Arabic is apparently Zábej. The first epigraphic occurrence of Jawa is in an inscription of 1343. In Marco Polo the name is the common appellation of all the Sunda islands. The Jawa of Ibn Batuta is Sumatra; Java is his Mul Jáwa (*i. e.*, possibly "original Java"). Jâwâ is the modern Javanese name (in the court speech Jawi), sometimes with Nusa, "island" or Tanah, "country." prefixed.

History.—The history of Java in its main outlines can be very briefly given; in detail it is burdened with endless complications, inconsistent accounts, and imaginative adornments. It is impossible to extract a rational narrative from the earlier *babads* or native chronicles, and even the later are destitute of any satisfactory chronology. The first great moment in the history is the ascendency of the Hindus, and that breaks up into three periods,—a period of Buddhism, a period of aggressive Sivaism, and a period of apparent compromise. Of the various Hindu states that were established in the island, that of Madjapahit was the most widely dominant; its tributaries were many, and it even extended its sway into other parts of the archipelago.[2] The second moment of the history is the invasion of Islam in the beginning of the 15th century; and the third is the establishment of European and more particularly of Dutch influence and authority in the island. In its general features this last and most important section reads very much like the narrative of the British subjugation of India. At the time when the Dutch East Indian Company began to fix its trading factories on the coast towns, the chief native state was Mataram, which had in the 16th century succeeded to the overlordship possessed by the house of Demak—one of the states that rose after the fall of Madjapahit. The "emperors of Java," as the princes of Mataram are called in the early accounts, had their capital at Kartasura, now an almost deserted place, 6 miles west of Surakarta. At first and for long the company had only forts and little fragments of territory at Jakatra (Batavia), etc.; but in 1705 it obtained definite possession of the Preanger by treaty with Mataram; and in 1745 its authority was extended over the whole northeast coast, from Cheribon to Banyuwangi. In 1755 the kingdom of Mataram was divided into the two states of Surakarta and Jokjokarta, which still retain nominal independence. The kingdom of Bantam was finally subjugated in 1808. By the English occupation of the island (1811–18) the European ascendency was rather strengthened than weakened; and the great Java war (1825–30), in which Dipa Negârâ made a last great struggle to maintain the position of the native dynasty, resulted in the complete success of the Dutch.

The fullest account of Java is contained in Professor Veth's *Java: Geographisch, Ethnologisch, Historisch,* 3 vols., Haarlem, 1875–80. The first volume consists of a general description of the geography, flora, fauna, inhabitants, language, etc.; the second gives a history of the native states (leaving the growth of the Dutch power; already treated in detail by De Jonge, as much as possible out of view); and the third presents a topographical description of each of the residencies. The very existence of such a work implies the previous existence of a vast literature on its subject. Besides Junghuhn, Raffles and others referred to above, and under the heading INDIAN ARCHIPELAGO, we may mention Ryckloff van Goens, *Javaense Reyse . . . in den Jare* 1656, Dort, 1666; Hogendorp, *Coup d'œil sur l'île de Java*, Brussels, 1830; Pfyffer von Neueck, *Skizzen von der Insel Java*, etc., 1829; Kussendragen, *Natuur, en aardrijksk. beschrijving van Java*, Groningen, 1841; W. R. van Hoevell, *Reis over Java*, Amsterdam, 1849, etc., and *Uit het Ind. leven*, Zaltbommel, 1860; D'Almeida, *Life in Java*; Pijnappel, *Geographie van Ned. Ind.*; Hollander, *Handleiding voor de land en volkenkunde van Nederlansch Indie.* Gramberg's historical romances, and E. D. Dekker (Multatuli), *Max Havelaar of de Koffieveilingen der Nederlandsche Handelsmaatschappij*, Amsterdam, 1860, are of value for their pictures of Javanese life. Professor Veth's work contains physical, historical, and topographical maps. Others on a larger scale will be found in the *Atlas van Nederland en zijne Overzeesche Bezittingen*, published by A. W. Sithoff, 1879. (H. A. W.)

JAWAROW, the chief town of a district in the Austrian crown-land of Galicia, with extensive suburbs. It contains a nunnery, and has a good grain market. The town was a favorite residence of the Polish king John Sobieski, who there received the congratulations of the pope and the Venetian republic on his success against the Turks at Vienna (1683). At Jawarow

[1] Dwipa is also part of the names Mal*dive* and Lacca*dive*.

[2] The work entitled *Madjapahit*, by Gramberg, is an historical romance based on the somewhat extravagant accounts of this kingdom.

Peter the Great was betrothed to Catherine I. The population in 1869 was 8699.

JAXARTES. See SIR DARIA.

JAY (French *Géai*), a well-known and very beautiful European bird, the *Corvus glandarius* of Linnæus, the *Garrulus glandarius* of modern ornithologists. To this species are more or less closely allied numerous birds inhabiting the Palæarctic and Indian Regions, as well as the greater part of America, but not occurring in the Antilles, in the southern portion of the Neotropical Region, or in the Ethiopian or Australian. All these birds are commonly called Jays, and form a group of the Crows or *Corvidæ*, which may fairly be considered as a Subfamily, *Garrulinæ*. Indeed there are, or have been, systematists who would elevate the Jays to the rank of a Family, *Garrulidæ*—a proceeding which seems unnecessary. Some of them have an unquestionable resemblance to the Pies, if the group now known by that name can be satisfactorily severed from the true *Corvinæ*. In structure the Jays are not readily differentiated from the Pies; but in habit, so far as is known of them, they are much more arboreal, delighting in thick coverts, seldom appearing in the open, and seeking their food on or under trees. They seem also never to walk or run when on the ground, but always to hop. The body-feathers are commonly loose and soft; and, gayly colored as are most of the species, in few of them has the plumage the metallic glossiness it generally presents in the Pies, while the proverbial beauty of the "Jay's wing" is due to the vivid tints of blue—turquoise and cobalt, heightened by bars of jet-black, an indication of the same style of ornament being observable in the greater number of the other forms of the group, and in some predominating over nearly the whole surface. Of the many genera that have been proposed by ornithologists, perhaps about nine may be deemed sufficiently well established.

The ordinary European Jay, *Garrulus glandarius* (fig. 1), has of late years suffered so much persecution in the British Islands as to have become in many districts a rare bird. In Ireland it seems now to be indigenous to the southern half of the island only; in England generally, it is far less numerous than formerly; and Mr. Lumsden (*Scottish Naturalist*, iii. pp. 230–240) has shown that in Scotland its numbers have decreased with still greater rapidity. There is little doubt that it would have been exterminated by this time but for its stock being supplied in autumn by immigration, and for its shy and wary behavior, especially at the breeding-season, when it becomes almost wholly mute, and thereby often escapes detection. No truthful man, however much he may love the bird, will gainsay the depredations on fruit and eggs that it at times commits; but the gardeners and gamekeepers of Britain fall into the usual error of persons imperfectly acquainted with the ways of Nature, and, instead of taking a few simple steps to guard their charge from injury, or at most of punishing the individual birds from which they suffer, deliberately adopt methods of wholesale destruction—methods that in the case of this species are only too easy and too effectual—by proffering temptation to trespass which it is not in Jay-nature to resist, and accordingly the bird runs great chance of total extirpation. Notwithstanding the war carried on against the Jay, its varied cries and active gesticulations show it to be a sprightly bird, and at a distance that renders its beauty-spots invisible, it is yet rendered conspicuous by its cinnamon-colored body and pure white tail-coverts, which contrast with the deep black and rich chestnut that otherwise mark its plumage, and even the young at once assume a dress closely resembling that of the adult. The nest, generally concealed in a leafy tree or bush, is carefully built, with a lining formed of fine roots neatly interwoven. Herein from four to seven eggs, of a greenish-white, closely freckled, so as to seem suffused with light olive, are laid in March or April, and the young on quitting it accompany their parents for some weeks.

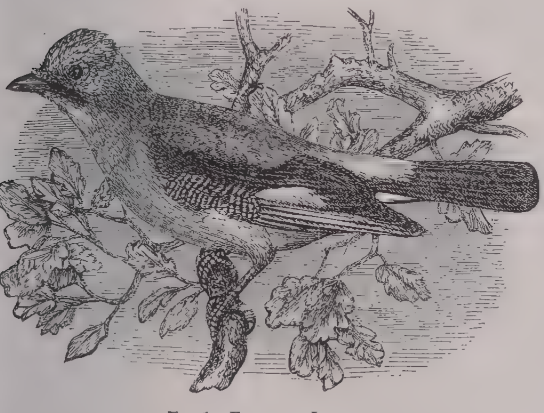

FIG. 1.—European Jay.

Though the common Jay of Europe inhabits nearly the whole of this quarter of the globe south of 64° N. lat., its territory in the east of Russia is also occupied by *G. brandti*, a kindred form, which replaces it on the other side of the Ural, and ranges thence across Siberia to Japan; and again on the Lower Danube and thence to Constantinople the nearly-allied *G. krynicki* (which alone is found in southern Russia, Caucasia, and Asia Minor) shares its haunts with it.[1] It also crosses the Mediterranean to Algeria and Morocco; but there, as in southern Spain, it is probably but a winter immigrant. The three forms just named have the widest range of any of the genus. Next to them come *G. atricapillus*, reaching from Syria to Beloochistan, *G. japonicus*, the ordinary Jay of southern Japan, and *G. sinensis*, the Chinese bird. Other forms have a much more limited area, as *G. cervicalis*, the local and resident Jay of Algeria, *G. hyrcanus*, found on the southern shores of the Caspian Sea, and *G. taevanus* confined to the island of Formosa. The most aberrant of the true Jays is *G. lidthi*, a very rare species, which seems to come from some parts of Japan (*vide* Salvadori, *Atti Accad. Torino*, vii. p. 474), though its exact locality is not known.

Leaving the true Jays of the genus *Garrulus*, it is expedient next to consider those of a group named, in 1831, *Perisoreus* by Bonaparte (*Saggio, etc., Anim. Vertebrati*, p. 43) and *Dysornithia* by Swainson (*F. B.-Americana*, ii. p. 495).[2]

This group contains two species—one the *Lanius infaustus* of Linnæus and the Siberian Jay of English writers, which ranges throughout the pine-forests of the north of Europe and Asia, and the second the *Corvus canadensis* of the same author, or Canada Jay, occupying a similar station in America. The so-called Siberian Jay is one of the most entertaining birds in the world. Its versatile cries and actions, as seen and heard by those who penetrate the solitude of the northern forests it inhabits, can never be forgotten by one who has had experience of them, any more than the pleasing sight of its rust-colored tail, which an occasional gleam of sunshine will light up into a brilliancy quite unexpected by those who have only surveyed the bird's otherwise gloomy appearance in the glass case of a museum. It seems scarcely to know fear, obtruding itself on the notice of any passenger who invades its haunts, and, should he halt, making itself at once a denizen of his bivouac. In confinement it speedily becomes friendly, but suitable food for it is not easily found. Linnæus seems to have been under a misapprehension when he applied to it the trivial epithet it bears; for by none of his countrymen is it deemed an unlucky bird, but rather the reverse. In fact, no one can listen to the cheery sound of its ordinary calls with any but a hopeful feeling. The Canada Jay, or "Whiskey-Jack" (the corruption probably of a Cree name), seems to be of a similar nature, but it presents a still more sombre coloration, its nestling plumage,[1] indeed, being thoroughly Corvine in appearance and suggestive of its being a pristine form.

---

[1] Further information will possibly show that these districts are not occupied at the same season of the year by the two forms.

[2] Recent writers have preferred the former name, though it was only used subgenerically by its author, who assigned to it no characters, which the inventor of the latter was careful to do, regarding it at the same time as a genus.

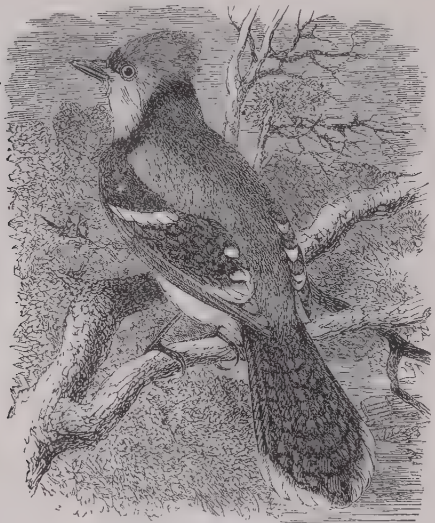

Fig. 2.—American Blue Jay.

As though to make amends for the dull plumage of the species last mentioned, North America offers some of the most brilliantly colored of the Subfamily, and the common Blue Jay of Canada and the Eastern States of the Union, *Cyanurus cristatus* (fig. 2), is one of the most conspicuous birds of the transatlantic woods. The account of its habits by Alexander Wilson is known to every student of ornithology, and Wilson's followers have had little to do but supplement his history with unimportant details.[2] In this bird and its many allied forms, coloration, though almost confined to various tints of blue, seems to reach its climax, but want of space forbids more particular notice of them, or of the members of the other genera *Cyanocitta*, *Cyanocorax*, *Xanthura*, *Psilorhinus*, and more, which inhabit various parts of the Western continent. It remains, however, to mention the genus *Cissa*, including many beautiful forms belonging to the Indian Region, and among them the *C. speciosa* and *C. sinensis*, so often represented in Oriental drawings, though doubts may be expressed whether these birds are not more nearly related to the Pies than to the Jays. (A. N.)

JAY, John (1745–1829), American statesman, was the descendant of a refugee Huguenot family, and was born at New York, December 12, 1745. After three years spent in the house of the pastor of the French church at New Rochelle, followed by four under a private tutor at home, he entered King's (now Columbia) College in 1760. On graduating there, May 15, 1764, he entered the office of Mr. Kissam, an eminent New York lawyer; and in 1768 he was called to the bar. He rapidly rose into a lucrative practice, and in 1774 was married to Sarah, youngest daughter of William Livingston, afterwards governor of New Jersey. The great crisis in the fate of the American colonies was fast approaching; and, like many other clever young lawyers, Jay took an eager, active part in the proceedings that resulted in the independence of the United States. He was one of the committee of fifty selected by the citizens of New York in 1774 to correspond with other colonial committees on the subject of the Boston Port Bill. He was returned as a delegate from New York city to the continental Congress held at Philadelphia in September, 1774, and, though almost the youngest member, was entrusted with drawing up the *Address to the People of Great Britain*. The numerous committees and associations which were from time to time appointed to meet the exigencies of that troubled period almost always included Jay's name. Of the second Congress also, which met at Philadelphia on May 10, 1775, Jay was a member; and his able and eloquent pen was again useful in writing addresses to the people of Canada and Ireland. He was a member of the secret committee of Congress for corresponding with the friends of America in Europe. In April, 1776, while still retaining his seat in Congress, Jay was returned to the provincial convention of New York by New York city and county; and his consequent absence from Philadelphia deprived him of the honor of affixing his signature to the declaration of independence issued on July 4, 1776. It was Jay who drafted the constitution that was finally adopted by the New York convention; and that statesman, after acting as one of the council of safety for some time, accepted a provisional appointment as chief justice of New York State, which was afterwards confirmed under the organized constitution, with the proviso that he could hold with his judicial post no other save that of delegate to Congress "on special occasion." Such occasion was found in the secession of what is now the State of Vermont from the jurisdiction of New Hampshire and New York. Jay was sent to Congress (December 7, 1778), of which he was immediately elected president. The following September his letter, written in the name of Congress, was addressed to the people of the States on the subject of currency and finance; and before the end of the year, having previously resigned his chief-justiceship and his presidency, he was despatched as plenipotentiary to Spain, where he landed January 22, 1780. The results of the mission were unsatisfactory. In addition to the fact that he was not received by the Spanish court in a formally diplomatic character, he was seriously embarrassed by the action of Congress in drawing bills upon him for more than half a million dollars, in the hope apparently that he would have received a subsidy from Spain before the bills fell due. Although by stooping to the humiliation of importuning the Spanish minister, and by accepting a number on his own personal responsibility, Jay was able to meet some of the bills, he was at length forced to protest others; and the credit of the new country was only saved by a timely subsidy from France, out of which Franklin was enabled to remit from Paris the sum required to meet the bills then due. In 1781 Jay was commissioned to act with Franklin, Adams, Jefferson, and Laurens in negotiating a peace with Great Britain. He arrived in Paris from Spain, June 23, 1782; and after a variety of negotiations, in the course of which Jay evinced a jealous suspicion of the disinterestedness of France and a punctilious attention to the dignity of his country, the provisional articles were signed on November 30, 1782, and the formal treaty on September 3, 1783. Jay resigned his commissions, and on July 24, 1784, landed as a private citizen in New York, where he was presented with the freedom of the city, and elected a delegate to Congress. On May 7th the last-named body had already chosen him to be foreign secretary; and in that post he remained till the beginning of the Federal Government in 1789. In the question of the institution of such a government he had taken a keen interest: he joined Hamilton and Madison in issuing the *Federalist;* he published anonymously (though without succeeding in concealing the authorship) *An Address to the People of New York*, in vindication of the constitution; and he ably seconded Hamilton in inducing his native State to adopt it. On September 26, 1789, he became the first chief-justice of the supreme court of the United States. During one of his circuits Harvard University conferred on him the degree of LL.D. In 1792 he consented to stand for the governorship of New York State; but the "canvassers" who scrutinized the votes disqualified the returns of three counties; and, though Jay had received an actual majority of votes, his opponent General Clinton was declared elected.

---

[1] In this it was described and figured (*F. B. Americana*, ii. p. 296, pl. 55) as a distinct species, *G. brachyrhynchus*.

[2] The "Blue Jay" of a recent American humorist would, however, from the locality assigned to his inimitable story, appear to be, not this species, but one of its western kindred—American ornithologists must determine which.

During the war between Great Britain and France, the relations between the former and the American States became critical; a definite commercial treaty seemed the only means of averting war. Chief-Justice Jay was chosen envoy to England, though not without strong opposition. He landed at Falmouth in June, 1794, signed a treaty with Lord Grenville on November 19, and disembarked again at New York, May 28, 1795. Several of the articles of "Jay's Treaty," especially that which declared that a free ship did not make free cargo, were hailed at home with furious denunciation. Jay was accused of having betrayed his country; his effigy was burnt along with copies of the treaty, and even after Washington signed the ratification in August, the States were in a ferment that prevented for a time the really beneficial action of the treaty. Two days before he landed, and before the particulars of the treaty had been published, Jay had been triumphantly returned as governor of his native State, and notwithstanding his temporary unpopularity, he was re-elected in April, 1798. With the close of this second term of office in 1801, he closed his public career. Although not yet fifty-six years old, he refused all offers of office, and, retiring to his estate near Bedford in Westchester county, New York, spent the rest of his life in rarely interrupted seclusion. His public utterances from 1821 till 1828 were mostly as president of the American Bible Society. On May 17, 1829, John Jay, in his eighty-fourth year, ended a life whose purity and integrity are commemorated in a sentence by Daniel Webster: "When the spotless ermine of the judicial robe fell on John Jay, it touched nothing less spotless than itself."

The *Life of John Jay, with Selections from his Correspondence and Miscellaneous Papers*, was published in 2 vols. by his son William Jay in 1833.

JAY, William (1769–1853), dissenting preacher and religious author, was born at Tisbury in Wiltshire on May 6, 1769. The son of a stone mason, he had adopted his father's calling, when his appearance attracted the attention of the Rev. Cornelius Winter, the dissenting minister. Mr. Winter at that time presided over a religious seminary at Marlborough, in which, with his advice and assistance, the young mason became a student in 1785. During the three years and a half that Jay spent at Marlborough, the wonderful preaching powers which distinguished him till the day of his death were rapidly developed. His first sermon was delivered in his seventeenth year; and before his majority he had preached nearly a thousand times. In 1788 he had even for a season occupied Rowland Hill's pulpit in London. But his youth warned him to seek more time for study, and he therefore accepted the humble pastorate of Christian Malford, near Chippenham, where he remained about two years. He had hardly spent a year in his next charge at the Hot Wells, Clifton, when he was unanimously chosen to be minister of Argyle Independent Chapel in Bath; and on January 30, 1791, he entered the sphere in which he was to spend the rest of his active life, attracting to his chapel hearers of every religious denomination and of every social and literary rank, and winning for himself a wide and solid reputation as a brilliant pulpit orator, as an earnest religious author, and as a pious minister. In 1841 the jubilee of his pastorate was celebrated; in 1852 he was requested to retire; and the connection of sixty-three years formally ended in January, 1853. He died on December 27, 1853.

As a preacher Jay was eloquent and impressive; but his expressions and style at times wanted refinement and delicacy. His sermons were often so practical and direct as to excite suspicion, though quite unfounded, of being aimed at individuals. He was fond of peculiar texts, and did not always restrain his sense of humor when in the pulpit. The popularity which his writings, especially his devotional writings, have found with a wide circle of readers vouches for their worth. In his books he is always earnest, homely, and practical, and at times attains a certain neatness of diction and aptness of illustration. Perhaps the best known of his works are his *Morning and Evening Exercises; The Christian Contemplated; The Domestic Minister's Assistant;* and his *Discourses.* For his *Short Discourses for the Use of Families* the diploma of D. D. was conferred upon him by the college of New Jersey; but he did not avail himself of the title. Jay also wrote an excellent *Life of Rev. Cornelius Winter*, and *Memoirs of Rev. John Clarke.* An edition of Jay's *Works* in 12 vols. 8vo, revised by himself, was issued in 1842–44; again, reduced in price, in 1856. A new edition, in 8 vols 8vo, was announced in 1876. For further particulars see Jay's *Autobiography*, 1854; Rev. S. Wilson's *Memoir of Jay*, 1854; Wallace's *Portraiture of Jay*, 1854; and Cyrus Jay's *Recollections of William Jay*, 1859.

JEAN D'ANGÉLY, Saint, chief town of an arrondissement in the department of Charente-Inférieure, France, is situated in a fertile vine-bearing district on the right bank of the river Boutonne, 16 miles southeast of La Rochelle. The most interesting buildings are the ruined abbey, destroyed in 1568, two large towers used as a prison and forming the remains of a 17th century church, an embattled clock-tower dating from 1276, a handsome colonnaded market-place, and a hospital. The inhabitants are engaged in distilling brandy, wool-spinning, and the manufacture of cast-iron tools, agricultural implements, serges, etc.; and a trade in spirits, wines, cereals, and oil seeds is carried on. The population in 1876 was 6309.

St. Jean d'Angély (*Angeriacum*) owes its origin to Pippin the Short, who founded a monastery on the spot about 768. The report that the head of John the Baptist was deposited there attracted crowds of pilgrims, for whose accommodation a town gradually grew up. In 1572 the duke of Anjou captured it from the Huguenots; but they retook it soon after. Its fortifications were razed under Louis XIII.

JEBEIL, Jubeil, or Djebail, an ancient town of Syria, is pleasantly situated on a slight eminence near the sea, about 20 miles north of Beyrout. It is surrounded by a wall, a mile and a half in circumference, with square towers at the angles, which along with the old castle at the southeast corner are attributed to the crusaders. In the gardens and vineyards that surround the town lie numerous broken granite columns,—these, with the number of ruined houses within the walls, testifying to its former importance. The stele of Jeḥawmelek, king of Gebal, found here is one of the most important of Phœnician monuments.[1] The small port is almost choked up with sand and ruins. The place has dwindled to a village of some 600 inhabitants.

Jebeil is the Phœnician Gebal and the Byblos of the Greeks. Its inhabitants were renowned as stone-cutters (1 Kings v. 18, margin) and as shipbuilders (Ezekiel xxvii. 9); while Arrian (ii. 20, 1) represents Enylus, king of Byblos, as joining Alexander with a fleet, after that monarch had captured the city. Philo of Byblos makes it the most ancient city of Phœnicia, founded by Kronos, *i. e.*, the Moloch (Melek) who appears from the stele of Jeḥawmelek to have been with Baaltis (בעלת גבל) the chief deity of the city. Baaltis on this stele has the characteristics of

---

[1] See the recent discussions by Euting (*Z.D.M.G.*, 1876), Halévy. (*Journ. As.*, 1879), and Ganneau (*Ét d'Arch. Or.* i., 1880).

Isis-Hathor. Compare the legend that the ark with the corpse of Osiris was cast ashore at Byblos, and there found by Isis (Plut., *Mor.*, 357). The orgies of Adonis in the temple of Baaltis (Aphrodite Byblia) are described by Pseudo-Lucian, *De Dea Syr.*, cap. vi. The river Adonis is the Ibráhím river, which flows near the town. The crusaders, after failing before it in 1099, captured "Giblet" in 1103, but lost it again to Saladin in 1189. Under Mahometan rule it has gradually decayed. See Renan, *Miss. de Phen.*; Movers, *Phönizier*, ii. 1, 107; Bädeker-Socin's *Handbook.*

JEDBURGH, a royal and parliamentary burgh of Scotland, the county town of Roxburghshire, is situated on the river Jed, a tributary of the Teviot, 49 miles southeast of Edinburgh, and 10 miles north of the English border. The town consists mainly of four well-paved streets diverging at right angles from the central market-square. Next to the abbey in point of historical interest is Queen Mary's house, where she resided for some time in 1566. The county prison occupies the site of the ancient castle of Jedburgh, destroyed in 1409. The abbey, one of the grandest ecclesiastical ruins in Scotland, was founded in 1118 by Prince David, afterwards David I., for the reception of certain Austin canons from St. Quentin's at Beauvais. The nave, an exquisite example of the transition from Norman to Early English, measures 133½ feet by 59½ feet. With the exception of the north piers and a small portion of the wall above, which are Norman, the whole of the tower, 30 feet square and 86 feet high, belongs to the end of the 15th century. In the choir there is some very early Norman work; the south chapel of the choir affords good specimens of the Decorated period. The total length of the magnificent pile, reduced to ruins by the conflicts of which Jedburgh was so often the scene, is 235 feet. Jedburgh, one of the first Scottish towns to take up the woollen manufacture (its first mill began in 1728), at present has five factories, employing 200 hands, and producing goods—chiefly tweeds—to the annual value of about £70,000. The burgh unites with Haddington, Dunbar, North Berwick, and Lauder in returning a member to parliament. The population in 1881 was 3400.

Jedburgh, the final form of a name of which eighty-two variations have been collected, does not appear before the 15th century; Jedworth, still lingering among the lower ranks as Jethart, is much more ancient; Ecgred, bishop of Lindisfarne (830-838), gifted that see with the village and lands of Geddewrd. Before the end of the 11th century the village had become a burgh; and under David I. (1124-1153) it was a royal residence, and the chief town of the Middle Marches. The town received a charter from Robert I., and another in 1566 from Mary. During the troublous times on the borders in the Middle Ages, Jedburgh was an important place, and often experienced the disastrous effects of fire and sword. The phrase "Jethart Justice," meaning hanging a man and trying him afterwards, has passed into a proverb.

JEFFERSON, Thomas (1743–1826), the third president of the United States, and the most conspicuous apostle of democracy in America, was born April 2, 1743, at Shadwell, Albemarle county, in the State of Virginia, a region of which his father Peter Jefferson, an obscure and unlettered planter, was the third or fourth settler.

At the early age of five years Thomas was sent to an English school, and from that time until he finished his studies at William and Mary's College, in 1762, appears to have enjoyed superior educational advantages, and to have turned them all to good account. He carried with him from college, at nineteen, a tolerably thorough reading knowledge of the Latin, Greek, and French languages, to which he added a familiarity with the higher mathematics and natural sciences only possessed at his age by men who have, as he had, a rare natural faculty for the prosecution of those studies. Soon after leaving college he entered the law office of Mr. George Wythe, then at the head of the Virginia bar, and withal, Jefferson being judge, "the best Latin and Greek scholar in the State." In Mr. Wythe he found a "faithful and beloved mentor in youth and most affectionate friend through life." In 1767, after five years' close application to the study of his profession, he was admitted to the bar. The death of his father, in 1757, left Thomas, who was the eldest son, heir to the estate on which he was born, and which yielded him an income of about £400 a year, a sum in those days sufficient to gratify all his tastes, and to give him, as he matured, the position of an independent country gentleman. At the time of his admission to the bar, he is described by his contemporaries as 6 feet 2 inches in height, slim, erect as an arrow, with angular features, a very ruddy complexion, an extemely delicate skin, full deep-set hazel eyes, and sandy hair, an expert musician (the violin being his favorite instrument), a good dancer, a dashing rider, and a proficient in all manly exercises. He was, and continued through life, frank, earnest, cordial, and sympathetic in his manner, full of confidence in men, and sanguine in his views of life.

Though mostly known to fame as a statesman, Jefferson's success as a lawyer showed that the bar had no rewards which were not fairly within his reach. He had sixty-eight cases before the chief court of the province the first year of his practice, and nearly twice that number the second. In the fourth, his register shows that he was employed in four hundred and thirty cases. During the eight years that he continued in active practice his income had enabled him to live like a gentleman, and to add a few hundred acres to his landed estate from time to time, until his inheritance of 1900 acres had become, in 1774, 5000 acres, and all paid for. But, while fired with the Virginian passion of the period for acquiring land, Jefferson does not appear to have shared the passion which usually accompanied it, of multiplying slaves to clear and till it. He was one of the first of English-speaking statesmen with foresight enough to discover the thunders with which the dark cloud of slavery was charged, and with courage enough to warn his countrymen against them. It does not appear that he ever acquired any slaves by purchase and as an investment.

In 1767, Governor Fauquier, the colonial governor of Virginia, died. The arrival of the new governor, Baron de Botetourt, in October, 1768, was followed, according to usage, by the dismissal of the House of Burgesses, and a new election was ordered. Jefferson, offering himself as a candidate, was elected from the county of Albemarle, and continued to be annually re-elected until the House of Burgesses was closed by the revolution. His public career began, like that of some of the greatest parliamentarians before him, in a mortifying failure. In conformity with a usage brought from the mother country of selecting one of the younger members to draft the reply to the governor's speech, this complimentary duty was devolved upon Jefferson. He confined himself too closely for the taste of the committee to the language of the resolutions which he was expected to amplify and glorify. His address was rejected, and the duty of preparing a substitute was confided to another member. This humiliation doubtless had some share in giving to his pen the parliamentary distinction usually won only by the tongue; for he was no orator—indeed, though one of the foremost members of several deliberative bodies in his time, he can fairly be said to have never made a speech.

Jefferson's legislative duties were not destined to detain him long from his profession. The king having abandoned the policy of levying internal taxes, and directed instead that a duty upon certain leading articles of foreign commerce should be levied at the custom-houses in the colonies, in the spring of 1769 a messenger arrived at Williamsburg, then the seat of government of Virginia, announcing to the House of Burgesses the firm resolve of Massachusetts to resist these duties by all constitutional means, and asking the concurrence and co-operation of Virginia. On the third day of the session of the House of Burgesses four resolutions were adopted with substantial unanimity, in harmony with those adopted by Massachusetts. The first declared against taxation without representation; the second, that the colonies may concur and co-operate in seeking redress of grievances; the third, that sending accused persons away from their country for trial is an inexpressible complexity of wrong; the fourth, that they should send an address on these topics to the "father of all his people," beseeching his "royal interposition." On the following day, and without waiting for an official copy of these resolutions to reach him, Governor Botetourt dissolved the House of Burgesses.

Thus in five days terminated, for the present, Jefferson's career as a legislator. But, though brief and crowned with no results to satisfy his ambition, history does not pronounce his first experience as a legislator inglorious, for it was illustrated by an effort, which was not the less honorable to him because it was unsuccessful, to ameliorate the condition of the African bondmen in Virginia. The law of those days forbade the manumission of a slave, except upon the condition that he was immediately sent out of the State. Jefferson desired the repeal of this law. His efforts were not only unsuccessful, but they developed such a state of feeling upon the subject as to bring into grand relief the courage which even at that early day ventured to propose such a measure.

The day after the House of Burgesses dispersed, its members met at a public hall in the Raleigh Tavern in Williamsburg, and, following the example of Massachusetts, resolved, with a near approach to unanimity—(1) to be more saving and industrious; (2) never to buy any article taxed by parliament for revenue, except low qualities of paper which they could not dispense with; nor (3) to import any article from Britain or in British ships if they could help it, until the offensive Act was repealed; and (4) to save all their lambs for wool. Every man who signed the agreement was re-elected, and every man who refused lost his election.

On February 1, 1770, while Jefferson and his mother were absent from home, his house was burned down. He had, however, already begun clearing the grounds and preparing for the erection of a new residence at Monticello, which occupied no inconsiderable portion of his time and thoughts for the next two years, and which was destined to become, for more than half a century, the most distinguished seat of private hospitality in America. On the 1st of January, 1772, he married Martha Skelton, a widowed daughter of a wealthy neighbor and associate at the bar of Williamsburg, of large fortune in lands and slaves. The lady was very handsome, childless, fond of music, twenty-three; she proved to him a loving and devoted wife, and was the centre of a domestic circle the joys of which seemed only to be intensified and consecrated by the distractions of his public life.

In the spring of 1773, Jefferson was appointed by the House of Burgesses a member of "a Committee of Correspondence and Inquiry for the Dissemination of Intelligence between the Colonies." The appointment of this committee responded to the necessity then beginning to be felt by all the colonies of making common cause against the pretensions of the Crown, and looked to a convention in which their united purposes might find expression. The resolutions which gave birth to this committee provoked an immediate dissolution of the House, but its members were all re-elected. Soon after they had resumed their sittings in the following spring, news reached them of what is known in history as "The Boston Port Bill," by which the chief port of Massachusetts was to be closed to commerce on the 1st of June of that year (1774). The House of Burgesses thereupon set apart that day for fasting, humiliation, and prayer, thereby provoking from the governor another dissolution, May 20, 1774. This immediately led to the selection of delegates from the several counties to meet at Williamsburg in August, to consider the state of the colony, and to provide for an annual congress of the colonies. Jefferson was chosen a delegate to the State Convention, but, owing to sudden indisposition which overtook him on his way, was unable to attend. His influence there, however, was not to be wanting, for much of the interval between the dissolution of the House and the meeting of the Convention was devoted to the consideration and preparation of a series of instructions for the deputies who were to be sent to the General Congress, which was to meet at Philadelphia in September. In these instructions, which he had intended himself to propose, could he have been present, he maintained "that the relation between Great Britain and these colonies was exactly the same as that of England and Scotland after the accession of James and until the Union, and the same as her present relations with Hanover,—having the same executive chief, but no other necessary political connection; and that our emigration to this country gave no more rights over us than the emigration of the Danes and Saxons gave to the present authorities of the mother country over England." These instructions, though too radical then for the purpose for which they were designed, were laid upon the table of the delegates, read by many, and published in a pamphlet entitled *A Summary View of the Rights of America*, and extensively circulated. It ran through edition after edition in England, after receiving such modifications (attributed to the pen of Burke) as adapted it to the purposes of the Opposition; and it procured for its author, to use his own language, "the honor of having his name inserted in a long list of proscriptions enrolled in a bill of attainder commenced in one of the two Houses of Parliament, but suppressed in embryo by the hasty course of events." This paper placed Jefferson among the leaders, if not at the head of the revolutionary movement in America—events rapidly ripening in the public mind its novel and startling doctrines. The Declaration of Independence two years later, of which he asked that his tombstone should testify as the greatest achievement of his life, was but a perfected transcript of the *Summary View*.

Jefferson was the leading spirit in the succeeding sessions of the Virginia Convention; he was one of a committee of thirteen appointed to report a plan for arming Virginia; he was named a delegate to the General Congress, where he took his seat eight days after Colonel George Washington had been appointed by Congress commander-in-chief of the armies of the colonies; and he was placed upon the committee to draw up a statement of the causes which had impelled the colonies to take up arms against the mother country, and upon another committee to report on Lord North's "conciliatory proposition." In the winter of 1775–6 disastrous news arrived from England. The king in opening parliament had denounced the colonists as rebels, and recommended decisive coercive measures against them; and this was promptly followed by a law authorizing the confiscation of American vessels and cargoes, and those of all nations found trading in American ports, and the impressment of American crews into the British navy. This measure and the large vote by which it was passed instantly crystallized the colonies, and on the 11th June, 1776, Congress appointed Jefferson, Adams, Franklin, Sherman, and Livingston to prepare a Declaration of Independence.

Jefferson at the request of his associates prepared a draft of the Declaration, which, after two or three verbal corrections by them, was taken up for consideration in the House on the 2d of July. In the debate on the Declaration Jefferson took no part, "thinking it a duty to be on that occasion a passive auditor of the opinions of others, more impartial judges than he could be of its merits and demerits." Two or three expressions had been used which gave offence to some members: the words "Scotch and other foreign auxiliaries" were resented by some delegates of Scottish birth; and the strictures on the king's repeated veto of colonial laws repealing the law which permitted the slave trade were disapproved by some of the southern delegates.

On the evening of the 4th of July, 1776, the Declaration was reported back from the committee of the whole House, and agreed to. Circumstances have given an historical importance to this document somewhat disproportioned to its merits as a statement of the grievances of the colonies; for it seemed to be the weapon that dismembered a great empire, and that gave birth to a nation of unlimited possibilities; it gave guarantees for the fame of its author which are possessed by no other production of an American pen; for more than a century it has been read to assembled multitudes in every considerable town in the United States on the anniversary of its adoption; and its style and sentiments have been the model for every people which since that time has sought to assert for itself the right of self-government.

Jefferson continued to participate actively in the efforts to organize the government of the confederation, and prepare it for the life and death struggle which was impending, until the 2d of September, when he resigned, to take his seat in the legislature of Virginia, to which he had been elected, and where he thought his services would be most needed. "When I left Congress in '76," he says in his autobiography, "it was in the persuasion that our whole code must be reviewed, adapted to our republican form of government, and, now that we have no negatives of councils, governors, or kings to restrain us from doing right, that it be corrected in all its parts with a single eye to reason and the good of those for whose government it was framed." To this task he now devoted himself. Of the various measures introduced in furtherance of this purpose he says: "I considered four, passed or reported, as forming a system by which every fibre would be eradicated of ancient or future aristocracy, and a foundation laid for a government truly republican." These were—the repeal of the laws of entail, the abolition of primogeniture and equal partition of inheritances, the restoration of the rights of conscience and relief of the people from taxation for the support of a religion not theirs, and a system of general education. He tried to add to these, but without success, the introduction of trial by jury into the courts of chancery, and to provide for the gradual emancipation of the slaves. He did, however, introduce a bill, which passed without opposition, forbidding the further importation of slaves into the State—the only important change effected in the slave system of Virginia during the revolutionary period. The importance he attached to his work in Virginia at this time he showed by resigning his seat in Congress, and by declining the appointment tendered him by Congress in 1776, to go with Franklin to Paris, to assist in negotiating treaties of commerce and alliance with France.

In the third year of the war (1779), and just as the darkest and most threatening clouds were gathering over Virginia, Jefferson was elected governor. The enemy had decided to carry the war into the south. The commonwealth was almost defenceless, all her military resources having been exhausted in sustaining Washington's policy of driving the enemy out of the north. Arnold entered Richmond, recently become the capital, on the 5th of January, 1781, and ravaged the place. The legislature, which had taken refuge at Charlottesville, were pursued and dispersed by Tarleton, who immediately sent a party to capture Jefferson at Monticello. He narrowly escaped, his pursuers being in sight of him as he mounted his horse and rode off to join his family. Though Monticello was spared by Tarleton's order, Jefferson's estate of Elk Hill, on the James river, was less fortunate. It was completely despoiled by the orders of Cornwallis. It was natural that the ineffectual resistance made to the enemy in Virginia should have exposed the governor's conduct to criticism, for few knew, as he did, that a more effective defence was impossible without weakening the northern army, and totally disarranging the plans upon which the commander-in-chief wisely relied for the ultimate success of the national defence. An investigation of his conduct was threatened; but when it was ascertained that he had been acting in harmony with the policy of Washington, the investigation was not only abandoned but the legislature shortly after the expiration of his term of office resolved unanimously "that the thanks of the general assembly be given to our former governor, Thomas Jefferson, for his impartial, upright, and attentive administration while in office. The assembly wish to declare in the strongest manner the high opinion which they entertain of Mr. Jefferson's ability, rectitude, and integrity as chief magistrate in this commonwealth, and mean, by thus publicly avowing their opinion, to obviate and to remove all unmerited censure." Jefferson became sensible that in the exhausted condition of Virginia, without money, without equipment, without troops, without any currency except the products of the soil, no governor not a trained soldier could hope to retain the confidence of the people during the crisis, and therefore he determined to decline re-election.

In 1782 he was summoned by Congress to act as one of the plenipotentiaries to negotiate a treaty of peace with the mother country, but the business was found to be so far advanced before he was ready to sail that his appointment was recalled, and we find him at the following winter session again occupying his seat in Congress, where, as chairman of the committee to which it was referred, he reported the definitive treaty of peace with England. At the succeeding session he introduced an elaborate report, and secured the adoption of the system of coinage which is still in vogue in the United States. In the same session he drafted the report of a plan for the government of the vast territory lying to the northwest of the Ohio river, which Virginia had ceded to the Federal Government in 1780. Among other provisions which he suggested, and which were adopted, was one big with a rebellion of far more threatening proportions than that which its author had just assisted in bringing to a successful issue. The clause in question provided "that after the year 1800 of the Christian era there shall be neither slavery nor involuntary servitude in any of the said States, otherwise than in punishment of crimes whereof the party shall be duly convicted to have been personally guilty." It was the attempt to organize States from this territory in defiance of this restriction that led to the war of 1861, and to the final, though costly, vindication of Jefferson's sagacity and forecast in 1783.

In 1784 Jefferson was again commissioned by Congress as minister plenipotentiary, this time to assist Franklin and Adams in negotiating treaties of commerce with European states. He joined his associates in Paris in July. The mission upon which he was sent proved somewhat premature. Jefferson, wisely judging that fuller and more correct information about America must precede any successful attempts to deal with European states to advantage, printed at his own expense, and distributed among his friends, some *Notes on Virginia*, which he had prepared two years before. It was in these notes that the oft-quoted passage occurs: "I tremble for my country when I think that God is just; that his justice cannot sleep forever; that, considering numbers, nature, and natural means only, a revolution of the wheel of fortune, an exchange of situations, is among possible events; that it may become probable by supernatural interference. The Almighty has no attribute that can take sides with us in such a contest." A very bad translation of a copy of the *Notes* which had found its way to France having made its appearance in Paris, Jefferson felt he had no longer any motive for trying to limit their usefulness to the few discreet friends to whom he had addressed them.[1]

In January 1785 Dr. Franklin, after eight years' residence at the French court, pressed his application to be relieved, and Jefferson was selected, as he gracefully put it in presenting his letters of credence, "to succeed him, for no one could *replace* him." Jefferson was exceedingly popular as a minister, and was fortunate in securing several important modifications of the French tariff in the interests of American commerce.

In the summer of 1789 Washington, who had been elected president of the United States under the new constitution, gave Jefferson leave of absence, and soon after his arrival in America, "as well from motives of private regard as a conviction of public propriety," tendered him the office of secretary of state. Reluctant as Jefferson was to leave Paris, he yielded at once to the wishes of the president, and entered upon the duties of his new office in March 1790. Alexander Hamilton, who was the head of the Federal party as distinguished from the Democratic, of which Jefferson was the most conspicuous representative, was appointed the secretary of the treasury. They represented the two great schools of political thought which contended for mastery in American politics, not only during Washington's administration, but for the succeeding sixty years, and until their differences were merged in the graver and more absorbing issues that grew out of the conflict between free and servile labor. Jefferson was an advocate of State sovereignty and of decentralization. He was strongly opposed to the leading features of the British constitution, and in cordial sympathy with the new school of politics which had recently begun to be felt in the government of France.

His five years' residence in that country had greatly strengthened him in these views, and they more or less affected his treatment of all questions that came before him as a cabinet minister. Hamilton's great fear, on the other hand, was that the central government under the new constitution would be too weak, and he favored all measures that tended to exalt and strengthen the executive, and to bring the government more in harmony with that of England. Washington very prudently gave the victory to the partisan of neither theory, though his sympathies were supposed to be more frequently with the Federal than with the Republican leader.

The most perplexing questions which occupied Jefferson's attention as secretary of state grew out of the war declared by France in 1793 against Holland and Great Britain. What should be the neutral policy and what were to be insisted upon as the neutral rights of the United States? Upon this question both parties put forth their whole strength. The Republicans, under Jefferson's lead, pretty generally sympathized with the French, and were inclined to authorize privateers to be fitted out in American ports to cruise against English vessels. This policy was energetically and wisely resisted by the Federalists, who were for peace with all and entangling alliances with none. Jefferson advocated the propriety of receiving a diplomatic representative from the French republic. In this his advice prevailed, and Genet was promptly sent as minister. With more zeal than discretion he proceeded at once to fit out privateers, and empower French consuls in the United States to organize courts of admiralty to condemn prizes. This led to heated discussions in the cabinet, and finally to the recall of Genet. Partly from discontent with a position in which he did not feel that he enjoyed the absolute, which meant pretty much the exclusive, confidence of the president, and partly because of the embarrassed condition of his private affairs, due mainly to the ravages of war, Jefferson resigned his seat in the cabinet December 31, 1793, and retired to Monticello. There he remained till the fall of 1796, when he was made vice-president at the election which called John Adams to the presidency. The duties of this position being limited to presiding over the Senate during its sessions, Jefferson spent most of the four years of his official term in improving his estate, and by his counsels directing the policy of the party of which he was the acknowledged leader. The excesses of the Reign of Terror had worked a formidable reaction in America against the sympathizers with revolutionists in France. This, with the aggressive policy of the Directory, and the insulting reception given to the American envoys in Paris, for a time paralyzed the Republican party. President Adams, mistaking the resentment felt in the United States towards France for a popular reaction there against republicanism, was betrayed into a series of ill-considered measures, which were not long in telling upon the fortunes of his party. Among these measures the most unfortunate perhaps were the alien and sedition laws, the former empowering the president to expel from the country such aliens as he should deem dangerous, and the latter punishing as sedition, with fine and imprisonment, the printing or uttering malicious charges against the president or Congress. The Republicans commenced an active agitation against the laws throughout the country, which, co-operating with a strong and popular sympathy with the Republican doctrines, finally resulted in the election of Jefferson and Burr, the candidates of the Republican party, as president and vice-president, and the defeat of Adams and Pinckney, the candidates of the Federalists. Washington having died only a few months before, this election proved the *coup de grace* of the Federal party, and established the Jeffersonian Republicanism as the permanent policy of the country. Jefferson entered upon the duties of the presidency on the 4th of March, 1801, and was re-elected for the term commencing March 4, 1805, by 143 out of 176 electoral votes. His administration of twice four years was characterized by the simplicity which distinguished his conduct in private life. He eschewed all pomp and ceremony designed artificially to distinguish the president from the people. His dress "was of plain cloth" on the day of his inauguration. Instead of driving to the capital in a coach and six as had been the practice, he rode there on horseback, without a guard or even a servant in his train, dismounted without assistance, and hitched the bridle of his horse to a fence. Instead of opening Congress in the English fashion, with a speech to which a formal reply was expected, he sent his message by a private hand. Court etiquette was practically abolished, and the weekly levee with it. The code of precedence was essentially modified. Titles of honor were not recognized as such. "Excellency," "Honorable," and even "Mr." were distasteful to him. Between the President and governors of States he recognized no difference in rank, each being the supreme head of an independent state. "If it be possible," he said, "to be certainly conscious of anything, I am conscious of feeling no difference between writing to the highest and lowest being on earth."

---

[1] Jefferson took a very modest view of this book, and in a purely literary point of view he could not afford to take any other; but it was so thoroughly saturated with democratic-republican ideas, of which he was then the most complete living exponent, with the possible exception of Franklin, that it was widely and eagerly read, and no doubt did much to relax the hold the doctrines of divine right and of passive obedience had upon the educated classes of France, and measurably contributed to precipitate the great popular uprising in that kingdom, with which Europe was soon to be convulsed.

In public official station he regarded himself purely as a trustee for the public. He discontinued the practice of sending ministers abroad in Government vessels, nor would he have his birthday celebrated by state balls; he refused to appoint days of fasting and thanksgiving on the ground that they were religious rites, and no recommendation from him, therefore, could make them more or less binding upon the conscience. To secularize and republicanize the Government were the paramount purpose and the distinguishing feature of his administration. His cabinet, of which Madison and Gallatin were the pillars, was in thorough sympathy with Jefferson in his general policy, and its perfect harmony was uninterrupted. He gave his ministers his entire confidence. "If I had the world to choose from," he once said, "I could not change one of my associates to my better satisfaction." The first important act of his administration was to send four of the six vessels constituting the so-called navy of the republic to the Mediterranean to exterminate the Algerine pirates who for half a century had preyed upon the commerce of the world, thus initiating a series of events which in a few years rendered the commerce of the Mediterranean as safe as that of the English Channel. Possessed with a conviction of the supreme commercial importance of New Orleans, he directed negotiations to be opened with the French Government, which resulted in the purchase for $15,000,000 of the territory of Louisiana, which had been ceded by Spain to France. Though the constitutional power under which this important transaction was consummated was far from clear, neither its validity nor its wisdom was ever seriously questioned; and it is now justly regarded by his countrymen as the crowning achievement of his administration, and none the less meritorious for the responsibility he deliberately assumed in bringing it to pass. The remainder of his administration derives most of its historic importance from his unsuccessful attempt to convict Aaron Burr, the late vice-president, of having engaged in treasonable projects in the southwest, and from his efforts to maintain, without war, the rights of neutrals on the high seas. Among the less conspicuous though scarcely less important measures of his administration were the careful exploration of the Western Territories; reducing the public debt, and practically extirpating from the country the then not unpopular delusion that a national debt is a national blessing; fortifying the seaports; reorganizing and rearming the militia; diminishing the taxes; and extinguishing the Indians' titles by fair purchase, and promoting their emigration beyond the Mississippi. On the 4th of March, 1809, he retired from the presidency, after an almost continuous public service of over forty years. He was pressed to allow himself to be re-elected for a third term, but refused unconditionally, though the legislatures of five States formally requested him to be a candidate.

Jefferson, whose private fortune had been seriously compromised by the interruptions of foreign commerce before and during his administration, and by the expenses incident to his representative position, lived seventeen years after his retirement, and to the last was the most considerable personage in the United States. His immediate successors in the presidency for the next sixteen years were his pupils and devoted personal friends, and rarely ventured upon any important step without the support of his approval. The employments of his closing years were in harmony with the dignified and patriotic purposes of his active life. Nothing that concerned the welfare of the country was a matter of indifference to him. He urged successfully the foundation of a university, and became one of its most efficient trustees. His correspondence during this period is regarded as one of the most interesting and instructive contributions to the early literature of the United States. He had inherited a wonderful constitution and herculean strength, neither of which did he ever abuse.

In the spring of 1826 the decline of his strength, which had been gradually increasing for two or three years, became more rapid, and on the 4th of July he expired, in the eighty-third year of his age. John Adams, his predecessor in the presidency, by an impressive coincidence, died on the same day,—the fiftieth anniversary of an event imperishably associated with the names of both and with the fortunes of a nation.

JEFFERSON CITY, capital of the State of Missouri, occupies an elevated and picturesque site in Cole county, on the right bank of the Missouri river, 125 miles west of St. Louis. The city is well built. It has an efficient school system, and is the seat of an Episcopal college, and of Lincoln Normal Institute, which is maintained by the State for the instruction of colored youths of both sexes. The State library contains about 25,000 volumes. The manufactures comprise flour, furniture, carriages, farm implements, and iron goods. Population in 1880, 5271.

JEFERSONVILLE, the county seat of Clark county, Indiana, U.S., is situated on the north bank of the Ohio river. The streets are of a uniform width of 60 feet. The falls of the Ohio afford a fine water-power, so that manufactories are numerous. Among them are locomotive and car works, plate-glass works, two ship-yards, and railway machine shops. The southern State penitentiary and an extensive Government depôt of army supplies are situated here. Population in 1880, 9357.

JEFFREY, FRANCIS (1773–1850), a judge in the Scottish Court of Session, with the title of Lord Jeffrey, was the son of a depute-clerk in the supreme court of Scotland, and was born at Edinburgh, 23d October, 1773. After attending the High School six years, he studied at the University of Glasgow from 1787 to May, 1789, and at Oxford from September, 1791, to June, 1792. Having in the following winter begun the study of law at Edinburgh University, he became a member of the Speculative Society, in the debates of which he measured himself not disadvantageously with Scott, Brougham, Francis Horner, the Marquis of Lansdowne, Lord Kinnaird, and others.

He was admitted to the bar on December 18, 1794, but, having abandoned the Tory principles in which he had been educated, he of course found his father's connection of little advantage to him; indeed the adoption of Whig politics was at this time almost a complete obstacle to legal success. His failure to obtain sufficient professional employment led him to the conception of a variety of schemes of "literary eminence," none of which were put into execution; and more than one attempt to obtain an office which would secure him the advantage of a small but fixed salary likewise proved abortive. To the proposal made by Sydney Smith in Jeffrey's house to a company of young men, none of whom had yet achieved fame or occupied any professional position of importance, that they should start a review, Jeffrey was accordingly prepared to give a favorable reception; and the scheme being received with acclamation, the result was the appearance on the 10th October, 1802, of the first number of the *Edinburgh Review*. At the outset the *Review* was not under the charge of any special editor. The first three numbers were, however, practically edited by Sydney Smith, and on his leaving for England the work devolved chiefly on Jeffrey, who, after an arrangement with Constable, the publisher, was appointed editor at a fixed salary. Most of those associated in the undertaking were Whigs in their political convictions; but, although the general bias of the *Review* was towards social and political reforms, it was so little of a party organ that for a time it numbered Sir Walter Scott among its contributors; and no distinct emphasis was given to its political leanings until the publication in 1808 of an article on the work of Don Pedro Cevallos on the *French Usurpation of Spain*, which led shortly afterwards to the appearance of the rival *Quarterly*. According to Lord Cockburn the effect of the first number of the *Edinburgh Review* was "electrical," and it is not difficult to understand why it should have been so, for, if its learning was far from being so omniscient as was then imagined, and if much of its speculation was superficial and rambling, and its literary criticisms greatly deficient in true subtilty and discernment, it certainly did not err on the side either of modesty or of dulness. Indeed, not only were its opinions generally expressed in telling and forcible language, but the clever vivacity and wit as well as the external glitter and brilliancy of many of the articles, and their easy and jaunty air, were fitted to produce an imposing impression of latent resources of many-sided talent and comprehensive erudition. The novelty, moreover, of such a voluminous and elaborate periodical, the anonymousness of its contributions, and the fact that it devoted its pages chiefly to extended criticisms—often by no means flattering or complimentary—of living authors, were all elements in its success. Of course, on the other hand, allowance must be made for its early deficiencies, not only on account of the literary inexperience of the writers, but from the fact that it was itself practically a hitherto untried experiment in literature. Its improvement as regards substantiality of matter and genuineness and depth of learning was very marked as soon as its success permitted Jeffrey to enlist in its service a staff of writers who had generally made a special study of the particular subjects on which they wrote, and who, instead of contenting themselves with a summary and an interspersed criticism of the works they reviewed, made them the occasion of an independent and original contribution, often having only a very remote connection with the works which suggested it. Whatever deductions also it may be necessary to make in distinguishing between the merits of the *Review* and its reputation, its influence both as a literary and as a political organ has much exceeded that of any other English periodical, and its relation to the social, political, and literary history of England during the first half of the present century has been of no small importance. The period of Jeffrey's editorship extended to about twenty-six years, having ceased with the ninety-eighth number, published in June, 1829. The *Macvey Napier Correspondence* gives some indication of what must have been the delicacy and difficulty of his task, and enables us to appreciate more intelligently the panegyric of his biographer in regard to the literary skill and practical discernment which gathered together such a brilliant galaxy of talent, the suave firmness and wise prudence which controlled and utilized to such advantage their several idiosyncrasies, and the tact and cleverness which arranged and adjusted their varied lights with such correct appreciation of harmonious unity.

Jeffrey's own contributions, according to a list which has the sanction of his authority, numbered two hundred, all except six being written before his resignation of the editorship, and two immediately subsequent to this. A selection from these contributions was published in 1843 in four volumes. The composition of eight *Review* articles in a year is not an excessive literary task, but the subjects on which Jeffrey elected to give his opinion were very multifarious, and he wrote with great rapidity, at odd moments of leisure, and with little special preparation. Although also he possessed a considerable accumulation of accurate information on a great variety of subjects, and had disciplined his taste by a wide and catholic acquaintance with English literature, he had given no thorough and systematic attention to any particular branch of study. Great fluency and ease of diction, considerable command of illustration, a certain superficial warmth of imagination and moral sentiment, a natural tendency towards mockery and ridicule, and a sharp eye to discover any oddity or peculiarity of style or violation of the accepted canons of good taste, were what lent to his criticisms the kind of pungency and effectiveness they possessed. It must, moreover, be added that, if he failed egregiously in the appreciation of the highest kinds of excellence both in style and in thought, the blemishes and defects which occupied so much of his attention, and which he magnified and distorted, had generally a real existence. Notwithstanding, however, his keen practical judgment and his liberal tendencies, both his political and his literary prognostications were generally falsified by the result. He never showed any proper comprehension of principles, or power of detecting and estimating latent forces either in politics or in matters strictly intellectual and moral; and certain of the higher spheres of reflection and imagination, as for example, that of the "Lake Poets," his unhappy mistakes in regard to whom have earned for him such unenviable fame, were utterly remote from his understanding and sympathy. Had an adequate share of his attention been concentrated on some special branch of literature, had his fluency been held in check by a more thorough acquaintance with the subjects which engaged his interest, his regard for immediate impressiveness not been exaggerated by the influence of his professional duties, his artistic sense, which was keen and true so far as it went, not been mutilated and deteriorated by untoward circumstances, he would undoubtedly have earned for himself a high place among the writers of his epoch. As it is, his reputation is now unsubstantial and shadowy, and he is remembered chiefly from his accidental and not always gratifying and desirable relation to others who have gained an independent fame.

Notwithstanding the increasing success of the *Review*, Jeffrey always continued to look to the bar as the chief field of his ambition, and indeed he soon experienced that his literary reputation was a help and not an obstruction to professional advancement. Probably one reason of this was that his literary talents were supplemented by a personal character of the highest integrity and honor, and by fine social gifts rooted in true geniality and kindness, and adorned with an agreeable pleasantry and wit never tainted with the venom of bitterness. As an advocate his sharpness and rapidity of insight gave him a formidable advantage in the detection of the weaknesses of a witness and the vulnerable points of his opponent's case, while he grouped his own arguments with an admirable eye to effect, especially excelling in eloquent closing appeals to a jury, more particularly when an opportunity presented itself for the introduction of the pathetic element. Probably but for his rapid utterance and affected accent, his weak physique, and his too copious command of language, he might have attained to the highest rank as an orator. Jeffrey was twice, in 1820 and 1822, elected lord rector of the university of Glasgow. In 1829 he was chosen dean of the faculty of advocates. On the Whigs obtaining office in 1831, he became lord advocate, and entered parliament as member for the Perth burghs. After the passing of the Reform Act, in the framing of which measure he had the principal charge so far as it related to Scotland, he was returned for Edinburgh; but his parliamentary career, which, though not so brilliantly successful as some expected, had won him high general esteem, was terminated by his elevation to the judicial bench as Lord Jeffrey in May, 1834. He died at Edinburgh, 26th June, 1850.

The Life of Lord Jeffrey, with a Selection from his Correspondence, by Lord Cockburn, appeared in 1852, in two volumes. See also the *Selected Correspondence of Macvey Napier*, 1877, and the sketch of Jeffrey in Carlyle's *Reminiscences*, vol. ii., 1881. (T. F. H.)

JEFFREYS, GEORGE JEFFREYS, LORD (*c.* 1648–1689), lord chancellor of England, was born probably in 1648, at Acton, in Denbighshire, of a respectable but not rich family. He was smitten with a desire of becoming a lawyer by seeing, when a boy, at St. Paul's school in London, the magnificent procession of the judges to the cathedral; and, although his family was hard put to it by the expense, he spent some time at Westminster school before entering the Inner Temple as a student, at sixteen. The allowance he received from home was quite unequal to the demands of the dissolute habits into which he quickly fell, but it is said that the promise of future eminence, afforded by the fits of studiousness which divided his orgies, procured for the dissipated student both long credit and presents of money. He was exceedingly popular as a table companion especially with the inferior attorneys and attorneys' clerks with whom, then as afterwards, he preferred to drink; and in the low practice which he began at Old Bailey and the London Sessions immediately on being called to the bar, in November, 1668, he found his boon companions very useful in procuring him briefs. Voluble, unscrupulous, and overbearing, he rapidly developed in his constant dealings with the most degraded criminals the coarse bullying manner which disgraced him throughout his whole career. He sought every means of ingratiating himself with the city aldermen, and in 1671, at the singularly early age of twenty-three, became their common serjeant, and in 1678 recorder of London. He had by that time pushed his way into the higher courts, where his marvellous address in speaking and cross-examination made up for, if it did not conceal, his shallow legal knowledge. Jeffreys had hitherto nominally belonged to the anti-court or liberal party; but, perceiving that they had but little patronage in their gift, he had opened secret negotiations with Charles II., and immediately on taking the oaths as recorder he openly declared himself a partisan of the court. The year before he had been knighted and appointed solicitor to the duke of York. To reward him for the servility which he displayed, especially in connection with the Popish plot trials, he was appointed chief justice of Chester, and advanced to a baronetcy. His insolence and intemperance, already notorious, became in his chief-justiceship wellnigh intolerable. He received a rebuff in 1680, when for his conduct in obstructing the assembling of parliament he was reprimanded on his knees by the speaker, and forced to resign his recordership in December of the same year. Such indignities were merits in the eyes of the king, to whose favor Jeffreys laid additional claims by his efforts to abrogate the charter of London, and by his activity as counsel against the suspected Rye House conspirators. He received his reward. Lord Campbell remarks, "Jeffreys became chief-justice of England, as the only man fit to condemn Algernon Sidney." He was sworn in in November, 1683, and shortly became privy councillor and member of the cabinet. In the court of the King's Bench, the new chief-justice let few considerations stand between him and his desire to satisfy the king. His iniquitous servility is to be traced in the *State Trials*. When Charles died in February, 1685, Jeffreys exchanged a master who disliked him as a wretch "with no learning, no sense, no manners, and more impudence than ten carted street-walkers," for one who found in him a thoroughly congenial tool. In May, 1685, Jeffreys was raised to the peerage by the style of Baron Jeffreys, of Wem, and in August went into the western counties as president of a special commission appointed to try the numerous cases of treason arising from the duke of Monmouth's ill-fated rebellion. It was in this "bloody assize" that he was to deepen the stain that already tarnished his fame, and to make the name "Judge Jeffreys" a synonym for a monster of bloodthirsty cruelty, blasphemous rage, and brutish intemperance. In the "campaign" he gave the rein to his ferocity; he was maddened with slaughter, and his appetite for blood grew by what it fed on. The horrible glare of his eye, the savage lines of his face, his fierce shouts of wrath, terrified and confused guilty and innocent alike. With hateful cunning he let it be bruited that the only hope of mercy lay in pleading guilty, and by this cold-blooded artifice lightened his labors. He had a powerful incentive to active butchery: the vacant post of lord chancellor was to be won by good service. The estimates of the numbers of victims of the commission vary: 320 was the official return to the treasury; Lord Lonsdale says 700, and Burnett, 600. Upwards of 800 were transported as slaves to the West Indies, while others only escaped by purchasing their pardons from the judge at most exorbitant rates. When the chief-justice returned to Windsor in September, the great seal of England was placed in his blood-stained hands. For the rest of his career the lord chancellor was an unresisting agent of King James in his most illegal schemes. Finding himself losing favor at court, he even revived the ecclesiastical court of high commission, abolished in 1640 by an Act which forbade its revival, and himself engaged to act as president. In the attempt against the rights of the fellows of Magdalen College, Oxford, and in the trial of the seven bishops, Jeffreys was the king's right hand; but, when the proceedings of James had at last roused the indignation that cost him his crown, the lord chancellor was one of the first to advise concession. When the king fled in 1688, Jeffreys was in the utmost consternation. For him, he knew, there could be no mercy. Shaving off his shaggy eyebrows, and disguising himself as a common sailor, he attempted to escape to Hamburg in a small collier, but, while drinking in a low public-house at Wapping, he was recognized by a poor scrivener who had once encountered the wrath of the judge, and had never forgotten the glare of his eye. Jeffreys was only saved from being torn in pieces by the mob by the timely arrival of a strong guard, who conducted the trembling wretch to the Tower. There he lay for some months, tortured by anguish both of mind and body, which he endeavored to drown in copious draughts of brandy. He died miserably on April 19, 1689. Jeffreys was twice married, and had ten children, but his title became extinct in 1703, in the person of his son John, notorious for having interrupted the funeral of Dryden. It is said that in 1688 Lord Jeffreys was about to be created earl of Flint; and, though the patent never passed the great seal, a book was dedicated to him, giving him the title.

For the character of Jeffreys not even the most impartial historian can say a good word. Of strong intelligence and clear legal head, and, according to Roger North, when he was in temper and matters indifferent came before him, becoming his seat of justice better than any other that author had seen in his place, he might have risen to a high position among the learned luminaries of the bench, had he not prostituted his talents to unworthy ends, and swamped his faculties in the most brutal intemperance. He treated all from whom he had nothing to expect with coarse insolence, taking an especially malicious delight in giving, as he phrased it, "a lick with the rough side of his tongue" to those whom his maudlin caresses of the night before had encouraged to presume. No less was he pleased to revile at dissenters. "Show me," he said, "a Presbyterian, and I will engage to show a lying knave." He is remarkable as the only politically prominent lawyer of his century who never sat in the House of Commons, nor left a single publication behind him. In the House of Lords he once attempted to use the insolent abuse of his court habits, but was compelled humbly to apologize, in tears of maudlin chagrin, to all whom he had attacked.

The chief sources for particulars about Jeffreys are the *State Trials* and North's *Life of Lord Keeper Guildford*, together with contemporary pamphlets and squibs. These materials have been skilfully used by Lord Campbell in his *Lives of the Lord Chancellors*, and by Macaulay in his *History*. See also Woolrych's *Memoirs of Judge Jeffreys*, 1827.

JEHOL, or Cheng-te-fu, a city of Mongolia famous as the seat of the summer palace of the emperor of China, is situated near 118° E. long. and 41° N. lat., about 140 miles northeast of Peking, with which it is connected by an excellent line of road. Though not enclosed by walls, the town, which is about 2 miles long, bears the stamp of "a flourishing Chinese town of the same rank." The population is stated at 10,000. The palace, called *Pi-shu-shan-chuang*, or "mountain lodge for avoiding heat," was built in 1703 on the plan of the palace of Yuan-ming-yuan near Peking. A substantial brick wall 6 miles in circuit encloses several well-wooded heights and extensive gardens, rockeries, pavilions, temples, etc., after the usual Chinese style. In the vicinity of Jehol are numerous Lama monasteries and temples, the most remarkable being Putalasu, built on the model of the palace of the grand lama of Tibet at Putala. It is thus described by Mr. Bushell (*Journ. R. Geog. Soc.*, Lond., 1874): "The principal building of this temple is a huge square erection with eleven rows of windows, the stories colored alternately red, green, and yellow, surmounted by a row of five dagobas, and with the roof covered with enamelled tiles of a bright turquoise blue. The general effect is inexpressibly bizarre."

JEHOVAH is the current European transcription of the sacred tetragrammaton יְהוָה. This was punctuated by the Massorets with vowels ĕ (for ă), ō, ā, of the word Adonai which the later Jews habitually substituted in reading the ineffable name. It is now generally agreed that Jahwé (Yahwé) is the true pronunciation, a conclusion which is supported not only by the linguistic argument derived from the fact that the various contracted forms in which the name appears, either separately (Jah) or in compound proper names (Jô, Jēho, Jāhu) are all reducible to Jahw, but also by the testimony of ancient tradition (thus Theodoret ascribes the pronunciation Ἰαβέ to the Samaritans, Epiphanius gives Ἰαβέ or Ἰαυέ, and Clement apparently Ἰαουέ). Etymologically, Jahwé may be regarded as the imperfect either of Qal or Hiphil of הוה; the former view seems to be that taken in the Pentateuch, but many critics now incline to the other, according to which the name may be translated as meaning "He who causes to be." It seems to have come to be invested with new and richer meanings as the religion of Israel developed in spirituality and depth; but as the name of the national deity it must have been older than the time of Moses; at least the name of the mother of Moses is compounded with it. It is conceivable that in the earliest period of its history the word was not associated with any idea so high even as that of "creator;" the Hiphil of הוה in the Aramaic sense of "fall" would give "he who causes (rain or lightning) to fall" as the nearest approach to the original meaning. For the later sense of the name Exod. iii. 14 is the *locus classicus*. The Palestinian tradition finds in this verse the assertion of God's eternity (comp. Rev. i. 8); the Alexandrian exegesis refers it to his absolute existence. More probably the vague "I will be what I will be" (the emphasis lying on the first verb as in Exod. xxxiii. 19) is used to convey the idea of that all-sufficiency of God's grace which is wider than the widest faith (comp. Hos. i. 6, 7).

The literature of the subject is immense. Of older books it is enough to refer to the *Decas Exercitationum* collected by Reland (Utrecht, 1707); for the latest aspects of the questions involved, see Gesenius, *Thes.*, *s. v.*; Ewald, *Gesch.*, ii. 121 *sq.*; Lagarde, *Psalt. Hieron.* (1874), p. 153 *sq.*, and *Orientalia*, ii. 27 *sq.*; Schrader in Schenkel's *Bib. Lex.*, *s. v.* "Jahve;" W. Aldis Wright in *Journ. of Philol.*, iv. p. 70. Against recent proposals to identify Jahwé with non-Israelite deities, see Baudissin, *Studien*, i. (Leipsic, 1876); and in favor of derivation from an Assyrian form of the Divine name *ia-u* (Accadian *i*), see Delitzsch, *Wo lag das Paradies*, p. 158 *sq.*, Leipsic, 1881. A summary of recent discussion is given by W. Robertson Smith in *Brit. and For. Evang. Rev.*, January, 1876.

JEJEEBHOY, Sir Jamsetjee (1783–1859), a Parsee merchant and great public benefactor, was born of poor parents in Bombay, July 15, 1783. Left an orphan while still very young, he had many difficulties to overcome at the outset of the mercantile career he chose for himself. On one occasion the ship in which he and all his goods were was captured by the French, and the young merchant was landed penniless at the Cape of Good Hope. Thence he procured a passage to Bombay through the charity of some Dutch ladies; and, resolutely beginning life afresh, he rose to be one of the most opulent Parsee merchants in India. His lavish benevolence, which recognized no difference of nation, sect, or class, and extended even to the brute creation, has won him enduring honor. In 1822 he paid the debts of all the poor debtors in Bombay jail; he enriched his native city with a hospital and an educational establishment for Parsee children, a school of art and other benevolent institutions, and contributed largely to the Grant Medical College, while to the public works at Bombay, Nowsaree, and elsewhere, he gave large grants, as well as to the patriotic fund and the Indian sufferers' fund after the mutiny. Eleven schools owe their foundation to his munificence, in which 2710 Parsee children are educated. It is estimated that he gave away upwards of 26 lakhs of rupees. Knighted in 1842, he was promoted to a baronetcy in 1857; a statue was voted to him in 1856, and was unveiled in Bombay town-hall on August 1, 1859. At his death on April 15, 1859, his property was estimated at 8,550,000 rupees. According to an act of the legislative council of India, the name Jamsetjee Jejeebhoy must be assumed by all his successors in the baronetcy. His son (1811-1877) was prominent as the head of the Parsee community in Bombay, and exercised a considerable influence among the Europeans. He was a member of the legislative council of Bombay.

JELÁL-ED-DÍN, Mohammed er-Rúmí (born at Balkh *c.* 1200 A. D., died at Iconium, 1273, as head of a college for mystic theology), one of the greatest poets and thinkers of Persia. See Persia.

JEMMAPES, or **Jemappes**, a village in the arrondissement and 3 miles west of the town of Mons, in the province of Hainault, Belgium, is situated on the Haine, near the "Bassin du Flenu," one of the richest coal-fields in the province. It has manufactures of mining gear, salt, soap, brass, and leather. The population of the commune in 1876 was 10,816.

Jemmapes is famous as the scene of a sanguinary battle fought November 6, 1792, between the French under Dumouriez and the Austrians under the duke of Saxe-Teschen, in which the latter were defeated. The French gained temporary possession of Belgium, and Jemmapes gave its name to a French department, comprising most of Hainault.

JENA, a town in the department of Apolda, in the grand-duchy of Saxe-Weimar-Eisenach, Germany, is situated, about 56 miles southwest of Leipsic by rail, at the junction of the Leutra and Saale, in a beautiful valley, surrounded by romantic hills, and dotted over with villages. The town is tolerably well built, though the houses are quaint, and many of the streets narrow. Besides the university buildings, the more interesting edifices are the 15th century church of St. Michael, with a tower 318 feet high, and containing the bronze statue of Luther, originally intended for his tomb; the college-church; the library; the old-fashioned town-house in the market-place; the castle, built in 1620, where Goethe wrote his *Hermann und Dorothea;* the Black Bear tavern (now a hotel), where Luther spent the night after his flight from the Wartburg; and Weigel's house. The *carcer*, or students' prison, ceased to be used for academic discipline in 1880. In 1858, the tercentenary of the inauguration of the university, the various houses in Jena that had been occupied by illustrious men were marked by memorial tablets. Close to the town are the Thuringian district court and the large lunatic asylum—both built in 1879. Of the old fortifications there remain only four towers and an ancient gateway; while the moat has been laid out as a promenade, adorned with busts and statues. On the Hausberg to the east rises the gaunt and legendary Fuchsthurm; and 2 miles to the west, on the Forstberg, is the tower raised to the students of Jena who fell in the war against France, 1870–71. Among the schools are a gymnasium opened in 1876, and a commercial school. Jena is the seat of an upper appeal court, of a statistical bureau for the Thuringian states, and of a chamber of commerce. The town owes what prosperity it now has to the presence of the university founded by the elector, John Frederick of Saxony, whose statue stands in the market-place. In 1547 that prince, while a captive in the hands of Charles V., conceived the plan of erecting a university at Jena, in place of that of Wittenberg, which he had forfeited. The academy, founded accordingly at Jena in 1548 by the elector's three sons, obtained the necessary charter from the emperor Ferdinand I., and on February 2, 1558, was formally inaugurated as a university. The students were most numerous about the middle of the 18th century, when some 3000 attended; but the most brilliant professoriate was under Duke Karl August, Goethe's patron (1787–1806), when in the different faculties Reinhold, Fichte, Schelling, Hegel, Schlegel, Oken, and Schiller read lectures. Founded as a home for the new religious opinions of the 16th century, Jena has always liberally granted a hearing to new teaching; and it distances perhaps every other German university in the extent to which it carries what are popularly regarded as the characteristics of German student-life,—duelling, and the sentimental passion for *Freiheit*. At the end of last and the beginning of the present century, the opening of new universities, co-operating with the suspicions of the various German Governments as to the democratic opinions which obtained at Jena, militated against it, and the university has never regained its former prosperity. In the session 1880–81 the teaching-staff numbered 80 members; in the winter session 1879–80 the students numbered 481, and in the summer session 1880, 546. Amongst the numerous auxiliaries of the university may be mentioned the library with 180,000 volumes; the seminaries of philology, theology, and education; the institutes for chemistry, pharmacy, zoology, botany (with a botanical garden), and meteorology (with an observatory in the garden of which a bust of Schiller marks the spot where he wrote his *Wallenstein*); the veterinary and agricultural institutions; and the various physical and archæological collections, which now occupy the castle. A clinical institute and the several hospitals assist the study of medicine. The *Jenaer Literaturzeitung*, whose issue in its present form began in 1874 under the patronage of the university, is the ultimate successor of the first *Literaturzeitung für Deutschland*, which appeared at Jena in 1785. The manufactures of Jena, which are not important, comprise cigars, pianos, cloth, woollens, cement, beer, and sausages. There is some activity in the book-trade and in vine-growing; and the traffic of wood-rafts on the Saale deserves mention. The population in 1875 was 9020.

Jena appears to have possessed town-rights in 1029. At the beginning of the 14th century it was in the possession of the margraves of Meissen, from whom it passed in 1423 to the elector of Saxony. Since 1485 it has remained in the Ernestine line of the house of Saxony. In 1662 it fell to Bernhard, youngest son of the duke of Weimar, and became the capital of a small separate duchy. Bernhard's line having become extinct in 1690, Jena was united with Eisenach, and in 1741 reverted with that duchy to Weimar. In more modern times Jena has been made famous by the defeat inflicted in the vicinity, on October 14, 1806, by Napoleon upon the Prussian army under the duke of Brunswick.

See Schreiber and Färber, *Jena von seinem Ursprung bis zur neuesten Zeit*, 2d ed., 1858; Ortloff, *Jena und Umgegend*, 3d ed., 1875.

JENGHIZ KHAN (1162–1227) Mongol emperor, was born in a tent on the banks of the river Onon, in 1162. His father Yesukai was absent at the time of his birth, being engaged in a campaign against a Tatar chieftain named Temuchin In this conflict the fortune of war favored the side of Yesukai, who having slain his enemy returned to his encampment in triumph. Here he was met by the news that his wife Yulun had given birth to a son. On examining the child he observed in its clenched fist a clot of coagulated blood like a red stone. In the eyes of the superstitious Mongol this circumstance took the shape of a mysterious reference to his victory over the Tatar chieftain, and he therefore named the infant Temuchin. The death of Yesukai, which placed Temuchin, who was then only thirteen years old, on the Mongol throne, was the signal also for the dispersal of several tribes whose allegiance the old chieftain had retained by the exercise of an iron rule. When remonstrated with by Temuchin on their desertion of his banner, the rebels replied: "The deepest wells are sometimes dry, and the hardest stone is sometimes broken; why should we cling to thee?" But Yulun was by no means willing thus to see her son's power melt away, and seizing the national standard, she led those retainers who remained faithful against the deserters, and succeeded in bringing back fully one-half to their allegiance. With this doubtful material for the maintenance of his chieftainship, Temuchin succeeded in holding his ground against the insidious plots and open hostilities of the neighboring tribes, more especially of the Naimans, Keraits, and Merkits. With one or other of these he maintained an almost unceasing warfare until the year 1206, when his power was so firmly established that he felt the time had arrived when he might proclaim himself the ruler of an empire. He therefore summoned the notables of his kingdom to an assembly on the banks of the Onon, and at their unanimous request adopted the name and title of Jenghiz Khan (Chinese, Ching-szé, or "perfect warrior.") At this time there remained to him but one open enemy on the Mongolian steppes, namely, Polo the Naiman khan. Against this chief he now led his troops, and in one battle so completely shattered his forces that Kushlek, the successor of Polo, who was left dead upon the field, fled with his ally Toto, the Merkit khan, to the river Irtish. Having thus further consolidated his sovereignty, Jenghiz Khan now meditated an invasion of the empire of the Kin Tatars, who had wrested northern China from the emperors of the Sung dynasty. As a first step in this programme he invaded western Hea, and, having captured several strongholds, retired in the summer of 1208 to Lung-ting to escape the great heat of the plains. While there news reached him that Toto and Kushlek the Merkit and Naiman khans, were preparing for war. He thereupon at once marched against them, and in a pitched battle on the river Irtish overthrew them completely. Toto was amongst the slain, and Kushlek fled for refuge to the Khitan Tatars. Satisfied with his victory, Jenghiz again directed his forces against Hea. There also good fortune attended him, and, after having defeated the Kin army under the leadership of a son of the sovereign, he captured the Wu-leang-hai Pass in the Great Wall, and penetrated as far as Ning-hea Fu in Kansuh. With unceasing vigor he pushed on his troops into the country, and even established his sway over the province of Leaou-tung. The saying that nothing succeeds like success was eminently true in his case. Several of the Kin commanders, seeing how persistently victory attended his banners, deserted to him, and garrisons surrendered at his bidding. Having thus secured a firm footing within the Great Wall, he despatched three armies in the autumn of 1213 to overrun the empire. The right wing, under the command of his three sons, Juji, Jagatai, and Oghotai, marched towards the south; the left wing under his brothers Hochar, Kwang-tsin Noyen, and Chow-tse-te-po-shi, advanced eastward towards the sea; while Jenghiz and his son Tulé with the centre directed their course in a southeasterly direction. Complete success attended all three expeditions. The right wing advanced as far as Honan, and after having captured upwards of twenty-eight cities rejoined headquarters by the great western road. Hochar made himself master of the country as far as Leaou-se; and Jenghiz ceased his triumphal career only when he reached the cliffs of the Shan-tung promontory. But either because he was weary of the strife, or because it was necessary to gain a respite that he might revisit his Mongolian empire, he sent an envoy to the Kin emperor in the spring of the following year (1214), saying, "All your possessions in Shan-tung and the whole country north of the Yellow river are now mine with the solitary exception of Yenking (the modern Peking). By the decree of heaven you are now as weak as I am strong, but I am willing to retire from my conquests; as a condition of my doing so, however, it will be necessary that you distribute largess to my officers and men to appease their fierce hostility." These terms of safety the Kin emperor eagerly accepted, and as a peace offering he presented Jenghiz with a daughter of the late emperor, another princess of the imperial house, 500 youths and maidens, and 3000 horses. No sooner, however, had Jenghiz passed beyond the Great Wall than the Kin emperor, fearing to remain any longer so near the Mongol frontier, removed his court to Kai-fung Fu in Honan.. This transfer of capital appearing to Jenghiz to indicate a hostile attitude, he again turned southward and once more marched his troops into the doomed empire.

While Jenghiz was thus adding city to city and province to province in China, Kushlek, the fugitive Naiman chief, was not idle. With characteristic treachery he requested permission from his host, the Khitan khan, to collect the fragments of his army which had been scattered by Jenghiz at the battle on the Irtish, and thus having collected a considerable force he leagued himself with Muhammed, the shah of Khuarezm, against the confiding khan. After a short but decisive campaign the allies remained masters of the position, and the khan was compelled to abdicate the throne in favor of his late guest.

With the power and prestige thus acquired, Kushlek prepared once again to measure swords with the Mongol chief. On receiving the news of his hostile preparations, Jenghiz at once took the field, and in the first battle routed the Naiman troops and made Kushlek a prisoner. A short shrift was given to the treacherous Naiman, and his ill-gotten kingdom became an appanage of the Mongol empire. Jenghiz now held sway up to the Khuarezm frontier. Beyond this he had no immediate desire to go, and he therefore sent envoys to Muhammed, the shah, with presents, saying, "I send thee greeting; I know thy power and the vast extent of thine empire; I regard thee as my most cherished son. On my part thou must know that I have conquered China and all the Turkish nations north of it; thou knowest that my country is a magazine of warriors, a mine of silver, and that I have no need of other lands. I take it that we have an equal interest in encouraging trade between our subjects." This peaceful message was well received by the shah, and in all probability the Mongol armies would never have appeared in Europe but for an unfortunate occurrence which turned Jenghiz's friendly overtures into a declaration of war. Shortly after the despatch of this first mission Jenghiz sent a party of traders into Transoxiana who were seized and put to death as spies by Inaljuk, the governor of Otrar. As satisfaction for this outrage Jenghiz demanded the extradition of the offending governor. Far from yielding to this summons, however, Muhammed beheaded the chief of the Mongol envoys, and sent the others back without their beards. This insult made war inevitable, and in the spring of 1219 Jenghiz set out from Karakoram on a campaign which was destined to be as startling in its immediate results as its ulterior effects were far reaching. The invading force was in the first instance divided into two armies; one commanded by Jenghiz's second son Jagatai was directed to march against the Kankalis, the northern defenders of the Khuarezm empire; and the other, led by Juji, his eldest son, advanced by way of Sighnak against Jend. Against this latter force Muhammed led an army of 400,000 men, who after a bloody battle with the invaders were completely routed, leaving it is said 160,000 dead upon the field. With the remnant of his host Muhammed fled to Samarkand. Meanwhile Jagatai marched down upon the Jaxartes by the pass of Taras and invested Otrar, the offending city. After a siege of five months the citadel was taken by assault, and Inaljuk and his followers were put to the sword. To mark their sense of the crime of which it had been the scene, the conquerors levelled the walls with the ground, after having given the city over to pillage. At the same time a third army besieged and took Khogend on the Jaxartes; and yet a fourth, led by Jenghiz and his youngest son Tulé, advanced in the direction of Bokhara. Tashkend and Nur surrendered on their approach, and after a short siege Bokhara fell into their hands. On entering the town Jenghiz ascended the steps of the principal mosque, and shouted to his followers, "The hay is cut; give your horses fodder." No second invitation to plunder was needed; the city was sacked, and the inhabitants either escaped beyond the walls or were compelled to submit to infamies which were worse than death. As a final act of vengeance the town was fired, and before the last of the Mongols left the district, the great mosque and certain palaces were the only buildings left to mark the spot where the "centre of science" once stood. From the ruins of Bokhara Jenghiz advanced along the valley of the Sogd to Samarkand, which, weakened by treachery, surrendered to him, as did also Balkh. But in neither case did submission save either the inhabitants from slaughter or the city from pillage. Beyond this point Jenghiz went no further westward, but sent Tulé, at the head of 70,000 men, to ravage Khorassan, and two flying columns under Chépé and Sabutai Bahadar to pursue after Muhammed, who had taken refuge in Nishapoor. Defeated and almost alone, Muhammed fled before his pursuers to the village of Astara on the shore of the Caspian Sea, where he died of an attack of pleurisy, leaving the cause of his empire to his son Jalâluddîn. Meanwhile Tulé carried his arms into the fertile province of Khorassan, and after having captured Nessa by assault, appeared before Merv. By an act of atrocious treachery the Mongols gained possession of the city, and, after their manner, sacked and burnt the town. From Merv Tulé marched upon Nishapoor, where he met with a most determined resistance. For four days the garrison fought desperately on the walls and in the streets, but at length they were overpowered, and, with the exception of 400 artisans who were sent into Mongolia, every man, woman, and child was slain. Herat escaped the fate which had overtaken Merv and Nishapoor by opening its gates to the Mongols. At this point of his victorious career Tulé received an order to join Jenghiz before Talikhan in Badakshan, where that chieftain was preparing to renew his pursuit of Jalâluddîn, after a check he sustained in an engagement fought before Ghazni. As soon as sufficient reinforcements arrived Jenghiz advanced against Jalâluddîn, who had taken up a position on the banks of the Indus. Here a desperate battle was fought. The Turks, though far outnumbered, defended their ground with undaunted courage, until, beaten at all points, they fled in confusion. Jalâluddîn, seeing that all was lost, mounted a fresh horse and jumped into the river, which flowed 20 feet below. With admiring gaze Jenghiz watched the desperate venture of his enemy, and even saw without regret the dripping horseman mount the opposite bank. From the Indus Jenghiz sent in pursuit of Jalâluddîn, who fled to Delhi, but failing to capture the fugitive, the Mongols returned to Ghazni after having ravaged the provinces of Lahore, Peshawur, and Melikpoor. At this moment news reached Jenghiz that the inhabitants of Herat had deposed the governor whom Tulé had appointed over the city, and had placed one of their own choice in his room. To punish this act of rebellion Jenghiz sent an army of 80,000 men against the offending city, which after a siege of six months was taken by assault. For a whole week the Mongols ceased not to kill, burn, and destroy, and 1,600,000 persons are said to have been massacred within the walls. Having consummated this act of vengeance, Jenghiz returned to Mongolia by way of Balkh, Bokhara, and Samarkand.

Meanwhile Chépé and Sabutai marched through Azerbijan, and in the spring of 1222 advanced into Georgia. Here they defeated a combined force of Lesghs, Circassians, and Kipchaks, and after taking Astrakhan, followed the retreating Kipchaks to the Don. The news of the approach of the mysterious enemy of whose name even they were ignorant was received by the Russian princes at Kief with dismay. At the instigation, however, of Mitislaf, prince of Galicia, they assembled an opposing force on the Dnieper. Here they received envoys from the Mongol camp, whom they barbarously put to death. "You have killed our envoys," was the answer made by the Mongols; "well, as you wish for war you shall have it. We have done you no harm. God is impartial; He will decide our quarrel." If the arbitrament was to be thus decided, the Russians must have been grievously in the wrong. In the first battle, on the river Kaleza, they were utterly routed, and fled before the invaders, who after ravaging Great Bulgaria retired, gorged with booty, through the country of Saksin, along the river Aktuba, on their way to Mongolia.

In China the same success had attended the Mongol arms as in western Asia. The whole of the country north of the Yellow river, with the exception of one or two cities, was added to the Mongol rule, and, on the death of the Kin emperor Seuen Tsung in 1223, the Kin empire virtually ceased to be, and Jenghiz's frontiers thus became conterminous with those of the Sung emperors who held sway over the whole of central and southern China. After his return from central Asia, Jenghiz once more took the field in western China. While on this campaign the five planets appeared in a certain conjunction which to the superstitiously minded Mongol chief foretold that evil was awaiting him. With this presentiment strongly impressed upon him he turned his face homewards, and had advanced no farther than the Se-Keang river in Kansuh when he was seized with an illness of which he died a short time afterwards (1227) at his travelling palace at Ha-laou-tu, on the banks of the river Sale in Mongolia. By the terms of his will Oghotai was appointed his successor, but so essential was it considered to be that his death should remain a secret until Oghotai was proclaimed that, as the funeral procession moved northwards to the great ordu on the banks of the Kerulon, the escort killed every one they met. The body was then carried successively to the ordus of his several wives, and was finally laid to rest in the valley of Keleen.

Thus ended the career of one of the greatest conquerors the world has ever seen. Born and nurtured as the chief of a petty Mongolian tribe, he lived to see his armies victorious from the China Sea to the banks of the Dnieper; and, though the empire which he created ultimately dwindled away under the hands of his degenerate descendants, leaving not a wrack behind, we have in the presence of the Turks in Europe a consequence of his rule, since it was the advance of his armies which drove their Osmanli ancestors from their original home in northern Asia, and thus led to their invasion of Bithynia under Othman, and finally their advance into Europe under Amurath I.

See H. H. Howorth, *The History of the Mongols;* Robert K. Douglas, *The Life of Jenghiz Khan.* (R. K. D.)

JENNER, EDWARD (1749–1823), the discoverer of vaccination, was born at Berkeley, Gloucestershire, on May 17, 1749. His father, the Rev. Stephen Jenner, rector of Rockhampton and vicar of Berkeley, came of a family that had been long established in that county, and was possessed of considerable landed property; he died when the subject of this notice was only six years old, but his place was admirably taken by his eldest son, the Rev. Stephen Jenner, who brought his brother up with paternal care and tenderness. Edward received his early education in local schools at Wotton-under-Edge and Cirencester, where he already showed a strong taste for natural history. The medical profession having been selected for him, he began his studies under Mr. Ludlow, a surgeon of Sodbury near Bristol; but in his twenty-first year he proceeded to London, where he became a favorite pupil of the celebrated John Hunter, in whose house he resided for two years. During this period he was employed by Sir Joseph Banks to arrange and prepare the valuable zoological specimens which he had brought back from Captain Cook's first voyage in 1771. He must have acquitted himself satisfactorily in this task, since he was offered the post of naturalist in the second expedition, but declined it as well as other advantageous offers, preferring rather to practise his profession in his native place, and near his eldest brother, to whom he was much attached. His speedy success in practice did not engross his intellectual activity. He was the principal founder of a local medical society, to which he contributed several papers of marked ability, in one of which he apparently anticipated later discoveries concerning the rheumatic inflammations of the heart. He maintained a correspondence with John Hunter, under whose direction he investigated various points in biology, particularly the hibernation of hedgehogs and the habits of the cuckoo; his paper on the latter subject was laid by Hunter before the Royal Society, and appeared in the *Philosophical Transactions* for 1788. He also devoted considerable attention to the varied geological character of the district in which he lived, collecting fossils from the Oolite and Lias, and constructed the first balloon seen in those parts. He was a great favorite in general society, from his agreeable and instructive conversation, and the many accomplishments he possessed. Thus he was a fair musician, both as a part-singer and as a performer on the violin and flute, and a very successful writer, after the fashion of that time, of fugitive pieces of verse, one of which—"The Signs of Rain"—has been frequently reprinted, and enumerates minutely all the signs of the weather in verse not unworthy of Crabbe. In 1788 he married Catherine Kingscote, a union destined to form a most important element in his happiness. In 1792 he resolved to confine himself to practising as a physician, and accordingly obtained the degree of doctor of medicine from St. Andrews. Finding that Berkeley could not support a physician, he began, a few years later, to visit Cheltenham annually.

Meanwhile the discovery that was to immortalize his memory had been slowly maturing in his mind. When only an apprentice at Sodbury, his attention had been directed to the relations between cow-pox and small-pox in connection with a popular belief which he found current in Gloucestershire, as to the antagonism between these two diseases. During his stay in London he appears to have mentioned the thing repeatedly to Hunter, who, being engrossed by other important pursuits, was not so strongly persuaded as Jenner was of its possible importance, yet spoke of it to his friends and in his lectures. After he began practice in Berkeley, Jenner was always accustomed to inquire what his professional brethren thought of it; but he found that, when medical men had noticed the popular report at all, they supposed it to be based on an imperfect induction of facts. His first careful investigation of the subject dates from about 1775, and five years elapsed before he had succeeded in clearing away the most perplexing difficulties by which it was surrounded. He first satisfied himself that two different forms of disease had been hitherto confounded under the term "cow-pox," only one of which protected against small-pox, and that many of the cases of failure were to be thus accounted for; and his next step was to ascertain that the true cow-pox itself only protects when communicated at a particular stage of the disease. At the same time he came to the conclusion that "the grease" of horses is the same disease as cow-pox and small-pox, each being modified by the organism in which it was developed—an opinion which is generally held at the present day. For many years, cow-pox being scarce in his county, he had no opportunity of inoculating the disease, and so putting his discovery to the test, but he did all he could in the way of collecting information and communicating what he had ascertained. Thus in 1788 he carried a drawing of the cow-pox, as seen on the hands of a milkmaid, to London, and showed it to Sir E. Home and others, who agreed that it was "an interesting and curious subject," but by no means realized its practical importance. At length, on the 14th of May, 1796, he was able to inoculate James Phipps, a boy about eight years old, with cow-pox matter. On the first of the following July the boy was carefully inoculated with variolous matter, but (as Jenner had predicted) no small-pox followed. The discovery was now complete, but he desired to act without precipitation, and was unable to repeat his experiment until 1798, owing to the disappearance of cow-pox from the dairies. He then repeated his inoculations with the utmost care, and prepared a pamphlet which should announce his discovery to the world. Before publishing it, however, he thought it well to visit London, so as to demonstrate the truth of his assertions to his friends; but he remained in London nearly three months, without being able to find any person who would submit to be vaccinated. Soon after he had returned home, however, Mr. Cline, an eminent surgeon, inoculated some vaccine matter over the diseased hip-joint of a child, thinking the counter-irritation might be useful, and found the patient afterwards incapable of acquiring small-pox. In the autumn of the same year, Jenner met with the first opposition to vaccination; and this was the more formidable because it proceeded from Dr. Ingenhousz, a celebrated physician and man of science. But meanwhile Mr. Cline's case, and his advocacy of vaccination, brought it much more decidedly before the medical profession, of whom the majority were prudent enough to suspend their judgment until they had more ample information. But besides these there were two noisy and troublesome factions, the one of which opposed vaccination as an useless and dangerous practice, while the other endangered its success much more by their rash and self-seeking advocacy. At the head of the latter was one Dr. Pearson, who in November, 1798, published a pamphlet speculating upon the subject, before even seeing a case of cow-pox, and afterwards endeavored, by lecturing on the subject, and supplying the virus, to put himself forward as the chief agent in the cause. The matter which he distributed, which had been derived from cows that were found to be infected in London, was found frequently to produce, not the slight disease described by Jenner, but more or less severe eruptions resembling small-pox. Jenner concluded at once that this was due to an accidental contamination of the vaccine with variolous matter, and a visit to London in the spring of 1799 convinced him that this was the case. In the course of this year the practice of vaccination spread over England, being urged principally by non-professional persons of position; and towards its close attempts were made to found institutions for gratuitous vaccination and for supplying lymph to all who might apply for it. Pearson proposed to establish one of these in London, without Jenner's knowledge, in which he offered him the post of honorary corresponding physician! On learning this scheme to supplant him, and to carry on an institution for public vaccination on principles which he knew to be partly erroneous, Jenner once more visited London early in 1800, when he had influence enough to secure the abandonment of the project. He was afterwards presented to the king, the queen, and the prince of Wales, whose encouragement materially aided the spread of vaccination in England. Meanwhile it had made rapid progress in the United States, where it was introduced by Dr. Waterhouse, the professor of physic at Cambridge, Massachusetts, and on the continent of Europe, where it was at first diffused by Dr. de Carro of Vienna, who practised it with the greatest zeal and discretion, and thence spread to Geneva. In consequence of the war between England and France, the discovery was later in reaching Paris; but its importance once realized, it spread rapidly over France, Spain, and Italy. It would be tedious and unprofitable to dwell minutely on the extension of vaccination over the whole world; but a few of the incidents connected with it are too remarkable to be omitted. Perhaps the most striking is the expedition which was sent out by the court of Spain in 1803, for the purpose of diffusing cow-pox through all the Spanish possessions in the Old and New Worlds, and which returned in three years, having circumnavigated the globe, and succeeded beyond its utmost expectations. Many of the expressions of enthusiasm seem to us strained and almost ridiculous. Thus we read with surprise how clergymen in Geneva and Holland urged vaccination upon their parishioners from the pulpit; how in Sicily, South America, and Naples religious processions were formed for the purpose of receiving it; how the anniversary of Jenner's birthday, or of the successful vaccination of James Phipps, was for many years celebrated as a feast in Germany; and how the empress of Russia caused the first child operated upon to receive the name of "Vaccinoff," and to be educated at the public expense. The truth is that we who live in that security from the horrible and universal plague of small-pox for which we are indebted to Jenner's immortal discovery cannot realize the greatness of the blessing he conferred upon mankind. This universal enthusiasm caused vaccination to spread over the whole world in the marvellously short period of six years, it being accepted with equal readiness by nations of the most diverse climes, habits, and religions. About the close of the year 1801 Jenner's friends in his native county of Gloucester presented him with a small service of plate as a testimonial of the esteem in which they held his discovery. This was intended merely as a preliminary to the presenting of a petition to Parliament for a grant. He was advised to apply for this, partly to obtain the formal approval of the highest court in this country for vaccination, but also for personal reasons. The premier, Mr. Addington, approved fully of this step, and fixed the 17th of March, 1802, for the presentation of his petition. This was referred to a committee, of which Admiral Berkeley, one of his warmest friends, was chairman, which examined carefully into the utility of vaccination, and Jenner's claims to its discovery. The investigations of this committee resulted in a report in favor of the grant, and ultimately in a vote of £10,000.

Towards the end of 1802 steps were taken to form a society for the proper spread of vaccination in London, and the "Royal Jennerian Society" was finally established, Jenner returning to town (having retired to Berkeley for three months) to preside at the first meeting. This institution began very prosperously, more than twelve thousand persons having been inoculated in the first eighteen months, and with such effect that the deaths from small-pox, which for the latter half of the last century had averaged 2018 annually, fell, in 1804, to 622. Unfortunately the chief resident inoculator soon set himself up as an authority opposed to Dr. Jenner, and this led to such dissensions as caused the society to die out in 1808.

Jenner was led, by the language of the chancellor of the exchequer when his grant was proposed, to attempt practice in London, but after a year's trial he returned to Berkeley. His grant was not paid until 1804, and then, after the deduction of about £1000 for fees, it did little more than pay the expenses attendant upon his discovery. For he was so thoroughly known everywhere as the discoverer of vaccination, that the correspondence of the whole world on this subject was upon him. As he himself said, he was "the vaccine clerk of the whole world;" and, at the same time, he continued to vaccinate gratuitously all the poor who applied to him on certain days, so that he sometimes had as many as three hundred persons waiting at his door. Meanwhile honors began to shower upon him from abroad: he was elected a member of almost all the chief scientific societies on the continent, the first being that of Göttingen, where he was proposed by the illustrious Blumenbach. But perhaps the most flattering proof of his influence was derived from France. He endeavored on several occasions to obtain the release of some of the unfortunate Englishmen who had been detained in France on the sudden termination of the peace of Amiens, but without success, until, in the case of two persons (Dr. Williams, a Ratcliffe travelling fellow, and a Mr. Williams) he applied to the emperor Napoleon himself. It was on this or some such occasion (for he afterwards repeated his intercession) that Napoleon was about to reject the petition, when Josephine uttered the name of Jenner. The emperor paused and exclaimed—"Ah, we can refuse nothing to that name." Somewhat later he was of the same service to Englishmen confined in Mexico and in Austria; and during the latter part of the great war persons before leaving England would sometimes obtain certificates signed by him which served as passports. In his own country his merits were less recognized. His applications on behalf of French prisoners in England were less successful; he never shared in any of the patronage at the disposal of the Government, and was even unable to obtain a living for his nephew George.

In 1806 Lord Henry Petty (afterwards the marquis of Lansdowne) became chancellor of the exchequer, and was so convinced of the inadequacy of the former parliamentary grant that he proposed an address to the crown, praying that the college of physicians should be directed to report upon the success of vaccination. Their report being strongly in its favor, the then chancellor of the exchequer (Mr. Spencer Perceval) proposed that a sum of £10,000 without any charge for fee or reward should be paid to Dr. Jenner. The anti-vaccinationists found but one advocate in the House of Commons; and finally the sum was raised to £20,000. Jenner, however, at the same time had the mortification of learning that Government did not intend to take any steps towards checking small-pox inoculation, which so persistently kept up that disease. About the same time a subscription for his benefit was begun in India, where his discovery had been gratefully received, but the full amount of this (£7383) only reached him in 1812.

The Royal Jennerian Society having failed, the National Vaccine Establishment was founded, for the extension of vaccination, in 1808. Jenner spent five months in London for the purpose of organizing it, but was then obliged, by the dangerous illness of one of his sons, to return to Berkeley. He had been appointed director of the institution; but he had no sooner left London than Sir Lucas Pepys, the president of the college of physicians, neglected his recommendations, and formed the board out of the officials of that college and the college of surgeons. Jenner at once resigned his post as director, though he continued to give the benefit of his advice whenever it was needed, and this resignation was a bitter mortification to him. In 1810 his eldest son died, and Jenner's grief at his loss, and his incessant labors, materially affected his health. In the following year he happened to be in London when the town was much excited by the case of one of Lord Grosvenor's children, who took the small-pox severely, after having been vaccinated by Jenner himself ten years before. The boy's recovery was no doubt to be ascribed to his vaccination, but the occurrence revived for a time all the clamor with which the discovery had been from the first greeted.

In 1813 the university of Oxford conferred on Jenner the degree of M.D. It was believed that this would lead to his election into the college of physicians, but that learned body decided that he could not be admitted until he had undergone an examination in classics. This Jenner at once refused; to brush up his classics would, he said, "be irksome beyond measure. I would not do it for a diadem. That indeed would be a bauble; I would not do it for John Hunter's museum."

He visited London for the last time in 1814, when he was presented to the allied sovereigns, and to most of the principal personages that accompanied them. In the next year his wife died after a long illness, and he felt her loss most acutely. It was the signal for him to retire from public life: he never left Berkeley again, except for a day or two, as long as he lived. He found sufficient occupation for the remainder of his life in collecting further evidence on some points connected with his great discovery, and in his engagements as a physician, a naturalist, and a magistrate. In 1818 a severe epidemic of small-pox prevailed, and fresh doubts were thrown on the efficacy of vaccination, in part, apparently, owing to the bad quality of the vaccine lymph employed. This caused Jenner much annoyance, which was relieved by an able defence of the practice, written by Sir Gilbert Blane. But this led him, in 1821, to send a circular letter to most of the medical men in the kingdom inquiring into the effect of other skin diseases in modifying the progress of cow-pox. A year later he published his last work, *On the Influence of Artificial Eruptions in certain Diseases;* and in 1823 he presented his last paper—"On the Migration of Birds"—to the Royal Society. In these pursuits the evening of his days passed happily away. On the 24th of January, 1823, he retired to rest apparently as well as usual, and next morning rose and came down to his library, where he was found insensible on the floor, in a state of apoplexy, and with the right side paralyzed. He never rallied, and died the following morning, January 26, 1823.

A public subscription was set on foot, shortly after his death, by the medical men of his county, for the purpose of erecting some memorial in his honor, and with much difficulty a sufficient sum was raised to enable a statue to be placed in Gloucester cathedral. In 1850 another attempt was made to set up a monument to him; this appears to have failed, but at length, in 1858, a statue of him was erected by public subscription in London.

Independently of that great discovery which will forever render his name immortal, Jenner possessed talents of observation and reflection that would have made him eminent as a naturalist and a physician. These qualities would have been more widely appreciated had not his tastes for rural scenes and domestic life led him to sacrifice such fame as is to be gained only amid the busy throng of men. This resolution was strengthened by his love for the simple pleasures of society, for which his varied accomplishments so well fitted him; indeed, there can be little doubt that he would never have had the perseverance to carry through his great discovery of vaccination had not his earnest benevolence pressed it on him, as a duty, to confer such a great and permanent benefit on the whole human race.

Jenner's life was written by the intimate friend of his later years, Dr. Baron of Gloucester (2 vols. 1827, 1838), and this excellent work is almost the sole source from which the present and other biographies of him have been taken. (J. R. G.*)

JENYNS, SOAME (1704–1787), author of the *Free Inquiry into the Nature and Origin of Evil*, was born at London, of a good family, in 1704. He enjoyed the best educational advantages, and studied at St. John's College, Cambridge. In 1742 he was chosen M. P. for Cambridgeshire, in which his property lay, and he afterwards sat for the borough of Dunwich and the town of Cambridge. From 1755 to 1780 he was one of the commissioners of the board of trade. He died December 18, 1787.

For the measure of literary repute which he enjoyed during his life Jenyns was indebted as much to his wealth and social standing as to his accomplishments and talents, though both were considerable. His poetical works, the *Art of Dancing*, 1727, and *Miscellanies*, 1770, contain many passages graceful and lively, though occasionally verging on license. The first of his prose works was his *Free Inquiry into the Nature and Origin of Evil*, 1756. This essay was severely criticised on its appearance, especially by Dr. Johnson in the *Literary Magazine*. Johnson in this critique—the very best paper of the kind he ever wrote—condemned the book strongly as a slight and shallow attempt to solve one of the most difficult of moral problems. Jenyns, a gentle and amiable man in the main, was extremely irritated by his failure. He put forth a second edition of his work with a vindication prefixed, and tried to take vengeance on Johnson after his death by a sarcastic epitaph. In 1776 Jenyns published his *View of the Internal Evidence of the Christian Religion.* Though at one period of his life he had affected a kind of deistic scepticism, he had now returned to the orthodox creed of his youth, and there seems no reason to doubt his sincerity, questioned at the time, in defending Christianity on the ground of its total variance with the principles of human reason. The work was deservedly praised in its day for its literary merits, but is so plainly the production of a dilettante in theology that as a scientific treatise it is valueless. A collected edition of the works of Jenyns appeared in 1790, with a biography by Charles Nelson Cole.

JEPHTHAH (יִפְתָּח ’Ιεφθάε), one of the "Judges" of Israel, was an illegitimate son of "Gilead," and, being expelled from his father's house by his lawful brethren, took refuge in the Syrian land of Tob, where he gathered around him a powerful band of homeless men like himself. The Ammonites pressing hard on his countrymen, the "elders of Gilead" called for his help, which he consented to give on condition that in the event of victory the supremacy should be conferred upon him. The success of his arms was complete, and he became in consequence "judge" of Israel until his death six years afterwards. His name is best known in history and literature in connection with his "vow," which led to the sacrifice of his daughter as a burnt offering on his return from the war. Much reluctance has been, and continues to be, shown by many writers in accepting the plain sense of the Scripture narrative on this point,—reluctance which proceeds to a large extent on unwarranted assumptions as to the stage of ethical development which had been reached in Israel in the period of the judges, or at the time when the narrative took shape. Several modern writers, on the other hand, are disposed to find a mythical element in the history of Jephthah. In this connection weight has been laid on his name, "the opener," on the fact that Gilead is not a personal name, and particularly on the circumstance that what is related about his daughter appears to be the popular explanation of a ceremony closely allied to well-known rites connected with solar mythology. The story of Jephthah is told in Judg. x. 15–xii. 7; a great part of this section of that book, however, is occupied with an allocution (xi. 14-27) to the children of Ammon which almost certainly belongs to a later hand.

See Wellhausen-Bleek, *Einleitung;* Goldziher's *Mythologie der Hebräer;* and Studer and Bertheau's commentaries on Judges.

JERBOA, a family of rodent mammals (*Dipodidæ*), chiefly characterized by the great length of the hind limbs as compared with those in front, the disproportion being in most cases greater even than in the kangaroos. Like the latter, the jerboas, or jumping mice, as they are also called, raise themselves when disturbed on their hind legs, and execute enormous leaps by the aid of a long muscular tail. When undisturbed, however, they make use of all their limbs in walking, while the front pair are also employed by many species as hands for the conveyance of food to the mouth. The jerboas, of which there are three genera and twenty-two species known, occur chiefly throughout northern and central Africa, southeastern Europe, and central and southern Asia, while one genus (*Pedetes*) is confined to South Africa and another (*Jaculus*) to North America. Of the third genus (*Dipus*) there are twenty known species, a typical example of which is the Egyptian jerboa (*Dipus ægyptius*). The length of its body is 8 inches, and of its tail, which is long, cylindrical, and covered with short hair, terminated by a tuft, 10 inches. Its front limbs are pentadactylous, and only 1 inch in length, the hind pair three-toed and six times as long. When about to spring, it raises its body by means of the hinder extremities, and supports itself at the same time upon its tail, while the fore feet are so closely pressed to the breast as to be scarcely visible. Hence probably the name *Dipus*, or two-footed. It then leaps into the air and alights upon its four feet, but instantaneously erecting itself, it makes another spring, and so on in such rapid succession as to appear as if rather flying than running. It is a gregarious animal, living in considerable colonies in burrows, which it excavates with its nails and teeth in the sandy soil of Egypt and Arabia. In these it remains during great part of the day, emerging at night in search of the herbs on which it feeds. It is exceedingly shy, and this, together with its extraordinary agility, renders it difficult to capture. The Arabs, however, succeed, it is said, in this by closing up all the exits from the burrows with a single exception, by which therefore they are forced to come, and over which a net is placed for their capture. When confined, they will gnaw through the hardest wood in order to make their escape. The Indian jerboa (*Dipus indicus*) is also a nocturnal burrowing animal, feeding chiefly on grain, which it stores up in underground repositories, closing these when full, and only drawing upon them when the supply of food above ground is exhausted. The natives in some parts of India are in the habit of searching for and robbing those granaries. The South African form, known as the spring haas or jumping hare of the colonists (*Pedetes capensis*), is the largest member of the family, measuring about a foot in length, exclusive of the tail, which is somewhat longer, and is bushy throughout. Its molar teeth are rootless, while its toes, which are three in number on each hind foot, are armed with long hoof-like nails. It is a powerful animal, nearly as large as a hare, and progresses when pursued by a series of leaps, each usually from 20 to 30 feet in length. Those jumping hares are found abundantly in the rocky plateaus of South Africa, where colonies of them form extensive burrowings somewhat similar to the rabbit warrens of Britain. Like other jerboas it is chiefly nocturnal, and occasionally it does considerable injury to the grain crops on which it feeds. Of the American genus (*Jaculus*) there is only a single species—the Labrador jumping mouse (*Jaculus hudsonius*). It occurs over a wide area of North America, extending from Missouri northward to Labrador, and from the Atlantic westward to the Pacific coast. It resembles the spring haas, and differs from all other jerboas in having the metatarsal bones separated, and also in having its feet five-toed. It is a small creature, measuring about 5 inches in length, exclusive of the much longer and very rat-like tail, and lives chiefly in the neighborhood of woods and shrubby places, where it conceals itself by day but roams in companies at night. Its agility is extraordinary; one kept in confinement by General Davies took, he says, "progressive leaps of from 3 to 4 and sometimes of 5 yards;" while Audubon considered it as probably the most agile of all wild animals. On the approach of winter the American jumping mouse retires into its burrow, and there encloses itself within a hollow ball of mud, in which it passes the cold season in a state of complete torpidity. The North American Indians neither eat its flesh nor make any use of its skin.

JERDAN, William (1782–1869), journalist, was born April 16, 1782, at Kelso, Scotland. After leaving the parochial school of his native town, his erratic youth between the years 1799 and 1806 was spent in the successive spheres of a country lawyer's office, a London West India merchant's counting-house, an Edinburgh solicitor's chambers, and the position of surgeon's mate on board H.M. guardship "Gladiator" in Portsmouth harbor, under his uncle, who was surgeon. In 1806 the insertion of some verses of his in a Portsmouth paper determined Jerdan's choice of literature as a profession; and, proceeding to London, he found employment as a newspaper reporter. By 1812 he had become editor of *The Sun*, a semi-official tory paper; but a quarrel with the chief proprietor brought that engagement to a close in 1817. He passed next to the editor's chair of *The Literary Gazette*, which he conducted with success for thirty-four years. Jerdan's position as editor introduced him into high social and literary circles; and it is not easy to account for the deference he met with, unless one is content to accept him at his own somewhat self-satisfied estimate, as contained in his *Autobiography* (4 vols., 1852–3), for which, however, there is no other warrant. An account of his acquaintance, among whom Canning was a special intimate, is to be found in his *Men I have Known* (1866). When Jerdan retired in 1850 from the editorship of the *Literary Gazette*, his pecuniary affairs, either through misfortune or imprudence, were far from satisfactory. A testimonial of over £900 was subscribed by his friends; and in 1852 a Government pension of 100 guineas was conferred on him by Lord Aberdeen. Among other works, including translations from the French, Jerdan contributed to *Fisher's National Portrait Gallery of Illustrious and Eminent Personages of the 19th Century*. He died July 11, 1869.

JEREMIAH. 1. *Life.*—The narrative portions of the Book of Jeremiah are singularly full and precise, and even apart from these the subjective, lyric tone of the prophet's mind enables us to form a more distinct idea of his character than we have of any other prophetic writer. He was the son of a priest named Hilkiah, and it has been held by many, both in ancient and in modern times, that this Hilkiah was the celebrated high priest of that name, who "found the book of the law (Torah) in the house of Jehovah" (2 Kings xxii. 8). This conjecture, indeed, is not a very probable one, for Hilkiah the high priest was of the house of Eleazar (1 Chron. ii. 13), and Anathoth, where Jeremiah's family lived, was occupied by priests of the line of Ithamar (1 Kings ii. 26). It is certain, however, that the prophet was treated by priests and officials with a consideration which seems to argue that he had high connections. Jeremiah was still young when he was called to the prophetic career (i. 6); the year is stated by himself (i. 2, xxv. 3) to have been the 13th of Josiah (629 or 627 B.C.). This was before the memorable "discovery" of the Torah, but the year immediately following that in which Josiah "began to purge Judah and Jerusalem from the high places and the images of Asherah" (2 Chron. xxxiv. 3). As yet, it appeared as if Judah was enjoying the peace promised to faithful worshippers of Jehovah; but the punishment of the sins of Manasseh was not to be long delayed. The battle of Megiddo (609 B.C,), which cost Josiah his life, and that of Carchemish (605 B.C.), which determined the Babylonian predominance to the west of the Euphrates, were the heralds of a fatal turn in the fortunes of the kingdom of Judah. Jeremiah (the Phocion of Judæa) saw this, and at once foretold the vast extension of Nebuchadnezzar's power. For the most part, his ministry was exercised in the capital, though from xi. 21 it may perhaps be inferred that he prophesied for some little time in his native place. It was during the reign of Jehoiakim that he went through that baptism of complicated suffering which has made him in a very high and true sense a type of One greater than he. King and people, priests and (official) prophets, were all against him, or at least the number of his supporters was too small to counterbalance the opposition. Only on one occasion, when accused of a capital crime as having "prophesied against this city," the "princes," supported by "certain of the elders" and "the people," were successful in quashing the accusation and setting the prophet free. At a later time Jeremiah incurred a still greater danger, though he was providentially saved from the hands of his persecutors. In the fourth year of Jehoiakim (which, it is important to remember, was the first of Nebuchadnezzar) Jeremiah was commanded to write down "all the words that I have spoken unto thee against Israel, and against Judah, and against all the nations . . . from the days of Josiah even unto this day" (xxxvi. 2). The interpretation of this passage, clear as it seems at first sight, is by no means easy. "First of all, an historically accurate reproduction of the prophecies would not have suited Jeremiah's object, which was not historical but practical; he desired to give a salutary shock to the people, by bringing before them the fatal consequences of their evil deeds. And next, it appears from ver. 29 that the purport of the roll which the king burned was that the king of Babylon should 'come and destroy this land,' whereas it is clear that Jeremiah had uttered many other important declarations in the course of his already long ministry." The most probable view is that of Grätz, viz., that the roll simply contained chap. xxv., which is in fact (omitting the interpolations in vers. 12, 26) entirely concerned with the invasion of Nebuchadnezzar and its consequences, and which expressly claims to have been written in the fourth year of Jehoiakim. "Is not *this* the prophecy which Jeremiah dictated to Baruch, and is not ver. 2 a loose, inaccurate statement due to a later editor? That the prophetic as well as the historical books have passed through various phases (without detriment to their religious value) is becoming more and more evident. The 7th and 8th chapters of Isaiah, and the 37th and 38th of the same book, have demonstrably been brought into their present shape by an editor; is it not highly reasonable to conjecture that these narrative chapters of Jeremiah have, to a greater or less extent, passed through a similar process?" The "princes," on this as on the former occasion (chap. xxvi.), were disposed to be friendly to Jeremiah and his secretary; but for some reason they felt themselves bound (as they did not feel themselves bound before) to refer the matter to the king. Jehoiakim was enraged at the contents of the prophetic roll, cut it in pieces, and threw them into the fire. This time Jeremiah escaped; but under the weak-minded Zedekiah he was more than once imprisoned (chaps. xxxii., xxxiii., xxxvii., xxxviii.). It is remarkable that, in the tension of feeling, the "princes," who were formerly friendly to Jeremiah, now took up an attitude of decided hostility to him. At last they had him consigned to a miry dungeon, and it was the king who interfered for his relief, though he remained a prisoner till the fall of Jerusalem. Nebuchadnezzar, who had doubtless heard of Jeremiah's constant recommendations of submission, gave him the choice either of going to Babylon or of remaining in the country (chaps. xxxviii., xxxix.). He chose the latter, and resided with Gedaliah, the native governor, at Mizpah. On the murder of Gedaliah he was carried to Egypt against his will (chaps. xl.–xliii.), where he predicted the approaching conquest and desolation of the Nile valley. A legendary tradition states that he suffered death by stoning.

2. *Character and Literary Style.*—It is interesting to compare Jeremiah with Isaiah. The earlier prophet had advantages which were denied to the latter; he lived at a period of comparative national prosperity, and his moral and intellectual gifts were of a stronger and more striking order. But Jeremiah has this noteworthy point in his favor that he overcame the natural shrinking of a somewhat feminine character, and showed himself able, in a strength not his own, to resist impediments which even Isaiah would have found terribly great. "When," as Ewald says, "the truth and the spirit of Jehovah call him or the resisting world provokes him to the contest, he then knows nothing of diffidence and fear, nothing of tenderness and pliability, he contends before the eyes of all with the most decisive energy against every false prophet who misleads the people (xxviii. 6 *sq.*, xxix, 15 *sq.*, 24 *sq.*); if the truth has not been proclaimed with due faithfulness to the king, he goes still, as Isaiah did in his day, without hesitancy, to the royal palace (xxii. 1–19, xxxiv. 2–7); and, although himself of a priestly family, he speaks from the very first with special emphasis against the growing degeneracy of the priests (i. 18, ii. 26, iv. 9), and is never weary of speaking against every kind of arbitrariness wherever and in whatever form it is found (xxxiv. 8–22, xxxvii. 14 *sq.*)." Another point of contrast is well worth noticing. Only five years after Jeremiah's first appearance as a prophet that great reform took place which was associated with the "discovery" of the Deuteronomic Torah. It is a highly probable conjecture (comp. chap. xi.) that Jeremiah was at the outset an ardent preacher of the contents of this great book; at any rate, his memory became surcharged with the ideas and even the phrases of Deuteronomy. The consequences of the reforming endeavors of what may be called the Deuteronomic party were both good and evil. The centralization of religion, and the emphasis laid on the moral duties, were steps of the highest importance. "But inasmuch as a sacred book was as such for the first time looked upon with greater reverence as a state authority, there arose thus early a kind of book-science with its pedantic pride and erroneous learned endeavors to interpret and apply the Scriptures; whilst at the same time there arose also a new kind of hypocrisy and idolatry of the letter, through the new protection which the state gave to the religion of the book acknowledged by the law. Thus scholastic wisdom came into conflict with genuine prophecy" (Ewald, *The Prophets*, iii. 63, 64). But something more than this was the result. "Hear ye the words of this covenant," was the address with which Jeremiah began his Deuteronomic preaching; but, as time went on, a deeper view of the covenant forced itself upon his mature mind, and the expression which it has found in xxxi. 31–34 is one of the passages which best deserve to be called "the gospel before Christ." It is sad that Jeremiah could not always keep his spirit under the calming influence of these high thoughts. No book of the Old Testament, except the Book of Job and the Psalms, contains so much which is difficult to reconcile with the character of a self-denying servant of Jehovah. Such expressions as those in xi. 20, xv. 15, and especially xviii. 21–23, contrast powerfully with Luke xxiii. 34, and show that the typical character of Jeremiah is not absolutely complete. cf. Luke XI: 37-51.

No wonder if Jeremiah's style is feeble compared with that of the "royal prophet" Isaiah,—if he gladly leans on older prophets, and copies or imitates more than a bolder genius would have permitted. His utterance is interrupted by sobs, and he is without the energy to soar to poetic heights. His brevity is that of "the evening star of prophecy," and Ewald even remarks (with some exuberance, perhaps) that he has "great wealth of new figures with great delicacy of description, a literary facility that readily adapts itself to the most different subjects, . . . and with all this an unadorned simplicity which is very unlike the greater artificiality of his contemporary Habakkuk."

3. *Dates of the Prophecies.*—According to Bleek, the following prophecies belong in all probability to the reign of Josiah, (*a*) ii. 1–iii. 5, (*b*) iii. 6–vi. 30 (expressly referred to this period), (*c*) vii. 1–ix. 25, (*d*) xi. 1–17. Dated prophecies meet us again in the time of Jehoiakim. Chap. xxvi., according to its own statement, arose in the beginning of his reign; and it is held by some that chap. vii. gives the same prophecy as xxvi. 2–6, only in a fuller form. The prophecy against Egypt in xlvi. 2–12, and the prophecy of the vast extension of the Babylonian power in chap. xxv., are both dated in the fourth year of Jehoiakim (the latter is evidently not free from interpolations). To the same eventful year, according to most scholars, belongs the writing of all Jeremiah's prophecies in the roll which was read before Jehoiakim; but we have already seen reason to doubt the soundness of this view. At any rate, chap. xxxv. belongs to this period, as the superscription and the contents combine to show. Bleek also refers several other prophecies to the reign of Jehoiakim, *e.g.*, (*a*) xvi. 1–xvii. 18, (*b*) xvii. 19–27, (*c*) xiv., xv., (*d*) xviii., (*e*) xi. 18–xii. 17. To the short reign of Jehoiachin, or to the last period of Jehoiakim's, we may refer x. 17–23, and perhaps chap. xiii., with its account of a strange symbolical action connected with the Euphrates or more probably

(Hitzig) Ephrath, *i.e.*, Bethlehem. Zedekiah's reign is much more fully represented in the prophecies; see chaps. xxii.–xxiv., xxvii.[1]–xxix., and, if li. 59 is to be followed, chaps. l., li. A little later in the same reign we may place chaps. xix., xx., which describe some remarkable scenes in Jeremiah's history. Later still, at the beginning of the siege of Jerusalem, fall xxxiv. 1–7, chap. xxi., and the group of chapters beginning at chap. xxxii. the important prophecies in chaps. xxx., xxxi., also perhaps belong to this period; and of course chap. xxxvii. and the following chapters.

It should be mentioned here that there are some portions of the book the Jeremianic authorship of which has been entirely or in part denied. (*a*) Chap. x. 1–16 was written, according to Movers, Hitzig, Graf, Knobel, and Naegelsbach by a prophet of the captivity—Movers and Hitzig say, by the author of Isaiah xl.–lxvi. (*b*) Chaps. xxx.–xxxiii., according to Movers and Hitzig, have been brought into their present shape by the author of Isa. xl.–lxvi., though the basis is Jeremianic. (*c*) Chaps. l., li., which Bleek assigns to the fourth year of Zedekiah, was according to Movers and Hitzig brought into its present form by a captivity prophet, working on a Jeremianic basis, while Ewald and Knobel hold it to have been entirely written at the close of the captivity. (*d*) Chap. lii. evidently forms the close of a history of the kings of Judah, and no doubt of the history followed very closely by the editor of the Books of Kings.

We cannot here enter fully into this subject. But something may be said on chaps. l., li.[2] It is open to grave doubts whether Jeremiah wrote these chapters. That he composed a prophecy against Babylon may be granted, and that he gave it to Seraiah with the charge described in li. 61–64, but it does not follow that the present prophecy on Babylon was the one referred to in ver. 60. There are special reasons for the opposite view, and they are analogous to these which lead so many students to doubt the Isaianic origin of Isa. xl.–lxvi. For example,—(1) the author of the latter prophecy (or the greater part thereof) writes as if he were living at the close of the Babylonian exile. So does the author of Jer. l., li. See chap. li. verses 33, 6 and 45, 11 and 28, 20–23. (2) Although the above statement is literally true of most of Isa. xl.–lxvi., yet there are some passages which are much more suggestive of a Palestinian than of a Babylonian origin (see ISAIAH). Precisely so in Jer. l., li., at least according to one prevalent interpretation of l. 5, li. 50 (which are thought to imply a residence in Jerusalem), l. 28, li. 11, 35, 51 (suggestive, perhaps, of the continuance of Jerusalem and the temple), l. 17, li. 34 (implying, as some think, that Nebuchadnezzar is still alive). Still there is so much doubt respecting the soundness of the inferences that it is hardly safe to rely too confidently upon them. The case of Jer. l., li. is therefore in so far rather less favorable to Jeremiah's authorship than that of Isa. xl.–lxvi. is to that of Isaiah. (3) Amongst much that is new and strange in the style and phraseology of Isa. xl.–lxvi., there is not a little that reminds one forcibly of the old Isaiah. Similarly with Jer. l., li. "Every impartial judge," says Kuenen, "must admit that the number of parallel passages is very large, and that the author of chaps. l., li. agrees with no one more than with Jeremiah." For instance, the formula, "Thus saith Jehovah Sabaoth, the God of Israel" (l. 18, li. 33) also occurs in vii. 3, ix. 15, and some twenty-six other passages; comp. also l. 3 with ix. 9; l. 5 with xxxii. 40; l. 7 with ii. 3, xiv. 18, xvii. 13.

The probability would therefore appear to be that, whatever solution we adopt for the literary problems of Isa. xl.–lxvi., an analogous solution must be adopted for Jer. l., li. The whole question is so large, and connects itself with so many other problems, that the present writer declines to pronounce upon it here. Only it should be observed—(1) that both subject and tone remind us of Isa. xl.–lxvi., and the kindred prophecies scattered about in the first part of the Book of Isaiah, and more especially of Isa. xiii. and the closely related prophecy, Isa. xxxiv.; (2) that these two chapters, Jer. l. and li., present some striking points of contact with Ezekiel, who, though contemporary with Jeremiah, was still a late contemporary, and allusion to whom (since Ezekiel was a literary rather than an oratorical prophet) imply that his prophetic book was already in circulation—in other words, suggest a date well on in the exile for the prophet who alludes to him; (3) that, though there are many Jeremianic allusions in Jer. l., li., there are also several passages copied almost verbally from prophecies of Jeremiah and applied to Babylon and its assailants (it seems difficult to believe that Jeremiah should have been so economical of his literary work). It deserves to be added (4) that, though Jeremiah is a great student of the earlier prophetic writings, and makes numerous allusions to them (see especially chaps. xlvi.–xlix.), nothing approaching to the mosaic work in Jer. l., li. can be pointed to in the undoubted prophecies of Jeremiah. In fact, the author of these chapters has borrowed almost the whole of their contents from other prophets,—his own property, so to speak, being too insignificant to be worth mentioning.

4. *The Massoretic Text and the Septuagint Version.*—The Alexandrian version presents an unusually large amount of variation from the received Hebrew text. Even in the order of the prophecies there is one remarkable discrepancy, viz., in the series of prophecies against foreign nations (chaps. xxv. 15–xlv. become in the LXX. chaps. xxxii.–li., the series of prophecies in question being transposed); and there is no doubt an approach to the truth in the LXX. arrangement. More important are the differences of reading. "The LXX. has very few additions, and these only single words or syllables; on the contrary, there are many omissions of words, sentences, verses, and whole passages (altogether about 2700 words are wanting, or the eighth part of the Massoretic text); also alterations of passages, sometimes not without influence on the sense" (Bleek); and these discrepancies are of extremely early date, for the state of the Greek text was already noticed by Origen (*Ep. ad Afric.*, p. 56, Migne). Three principal explanations have been offered:—(1) the error of copyists (Jerome, Grabe); (2) negligence and caprice on the part of the Greek translators (Spohn, Naegelsbach, Wichelhaus, Keil, Graf); (3) the existence of various (or at least two) recensions of the Hebrew, the recension used by LXX. being nearer to the original text than that of the Massorets (J. D. Michaelis, Movers, Hitzig, Bleek). A better view is that adopted by Ewald, Schrader, and Kuenen, according to which the Massoretic text is on the whole the best; but the Greek version, in spite of the manifold errors and caprices of the translator, sometimes approaches more nearly to the original than the Massoretic text.

Modern Literature.—Venema, *Comment in librum prophet. Jeremiæ*, 2 vols., Leeuwarden, 1765; Blayney, *Jeremiah and Lamentations, a new translation, with notes critical, philological, and explanatory*, London, 1784; Spohn, *Jeremias vates e vers. Jud. Alexandr. ac reliqu. interpr. Græc. emendatus, notisque crit. illustratus*, 2 vols., Leipsic, 1794, 1824 (of little value); Roorda, *Comm. in aliquot Jer. loca*, Groningen, 1824; Movers, *De utriusque recensionis vaticiniorum Jeremiæ, Græcæ Alexandrinæ et Hebraicæ Masorethicæ, indole et origine*, Hamburg, 1837; Küper, *Jeremias librorum sanctorum interpres atque vindex*, Berlin, 1837; Wichelhaus, *De Jeremiæ versione Alexandrina*, Halle, 1847; Scholz, *Der Mas. Text und die LXX. Uebers. d. B. Jer.*, 1875; Guthe, *De Fœderis notione Jeremiana*, 1877. Commentaries by Graf, Leipsic, 1862; Hitzig, 2d ed., Leipsic, 1866; Naegelsbach, Bielefeld and Leipsic, 1868; Keil, Leipsic, 1872; Payne Smith (*Speaker's Commentary*, vol. v.), London, 1875; Ewald (vol. iii. of English translation of *Die Propheten*), London, 1879; Scholz, 1880; Cheyne (*Pulpit Commentary*), in the press.

---

[1] In xxvii. all critics agree that for "Jehoiakim" we should substitute, with the Syriac version, "Zedekiah."

[2] Compare a paper by Budde in *Jahrb. f. D. Theol.*, 1879.

(T. K. C.)

JEREZ DE LA FRONTERA, a city in the province of Cadiz, Spain, near the right bank of the Guadalete, 16 miles N.N.E. of Cadiz (28 by rail), and 67 S.S.E. of Seville. It is pleasantly situated on an undulating plain of much fertility, and covers a considerable extent of ground. The old crenated Moorish wall by which it was formerly surrounded, but which it has now quite outgrown, still partially exists, as also do some of the ancient gateways. The newer portions of the town are well built, having broad regular streets with numerous "plazas" or squares adorned with fruit trees. The principal buildings are the Alcazar, an old palace fortress belonging to the Moorish period, adjoining the modern "alameda" or promenade; the collegiate church (1695), which, however, though large, presents no attractive architectural features; and the municipal buildings, belonging to the end of the 16th century, which display considerable taste. There are numerous other churches, a theatre, an orphanage, four hospitals, an "institute," a library, and various schools. The bull ring (1875) is a large one, and enjoys a good repute in Andalusia. The staple article of trade is the wine grown in the neighborhood, known from the name of the town as "sherris" (xeres) or sherry, of which in 1876 a total of 4,607,550 imperial gallons was exported. Of these Great Britain and Ireland took 4,024,114, British colonies 51,122, and other parts of the world 532,314. The population in 1877 was 64,533.

Jerez has sometimes been identified with the ancient *Asta Regia*, but is most probably the *Asido* ("quæ Cæsariana") of Pliny. The *Sherish* of the Arabs is said to have been a corruption from *Cæsaris Asido*. It was in this neighborhood that the decisive battle of the Guadalete (July 711) was fought which practically made Tarik master of the entire Pyrenæan peninsula. Jerez, which is frequently mentioned in the chronicles of the Spanish Arabs, was recovered by Alphonso the Wise in 1255.

JEREZ DE LOS CABALLEROS, a city in the province of Badajoz, Spain, is picturesquely situated 39 miles to the south of that city, on two heights near the Ardila, a tributary of the Guadiana. The old town is surrounded by a Moorish wall with six gates; the newer portion of the city is well and regularly built, and adorned with numerous orange and other fruit trees. It has linen and woollen manufactures to a limited extent and several tanneries; but its principal articles of trade are the various agricultural and other products of the district, especially the fine quality of pork which is reared in the oak forests of the neighborhood. The town is said to have been founded by Alphonso IX. of Leon in 1229; in 1232 it was extended by his son Saint Ferdinand, who gave it to the Knights Templars, whence the name *de los Caballeros*. It was made a city by Charles V. The population in 1877 was 8463.

JERICHO (יְרִיחוֹ, יְרֵחוֹ, "fragrant," or, perhaps, according to an old interpretation, "city of the moon") was the first city west of the Jordan occupied by the Israelites. The city was destroyed, and, though it is mentioned from time to time under its usual name (2 Sam. x. 5) or by its epithet "city of palm trees" (Judg. i. 16, iii. 13, comp. Deut. xxxiv. 3), it was not rebuilt as a fortified place till the reign of Ahab (1 Kings xvi. 34), when it became the seat of a prophetical society, and appears in the history of the prophet Elisha (2 Kings ii.). The narrative of the healing of the waters by Elisha is referred by Josephus (*B. J.* iv. 8, 3) to the copious fountain now called the Sultan's Spring, which lies on the western margin of the Jordan valley, 700 feet below the Mediterranean level, and just under the cliffs of M. Quarantania. The mounds surrounding the spring are of sun-dried brick, and show no traces of ancient building. The position of the town, in a district of great fertility, with rose gardens (Eccles. xxiv. 14), various species of date palms, and valuable cultivation of henna, opobalsamum, and myrobalan (Jos., *ut supra;* Strabo, xvi. 2), secured its prosperity, while its situation at the gate of the great pass leading up from the Jordan valley to Jerusalem gave it strategical importance. Thus we find that it shared the calamities of the Babylonian exile (Ezra ii. 34), was reoccupied on the restoration (Neh. iii. 2), and was fortified by Bacchides in the Maccabee wars (1 Mac. ix. 50). In the time of Strabo there were two forts, Threx and Taurus, protecting the pass above Jericho. Antony gave the groves of Jericho as a rich gift to Cleopatra. From her they passed to Herod the Great, who made the city his winter residence, and adorned it with buildings, crowning the height above with a fortress named after his mother Cyprus. Here it was that the tyrant died. It appears, however, that the Jericho of Herod was not on the site of the old city (Jos., *ut supra*) but a mile to the south, where there are also mounds and the remains of five aqueducts conveying water from three distant springs. A great tank, of which the ruins are still traced, has been conjectured to be the same in which Herod drowned Aristobulus (Jos., *Ant.*, xv. 2, 3). In the time of Christ the pilgrims from Peræa and Galilee appear to have gathered at Jericho on their way to Jerusalem, and so the town is repeatedly mentioned in the Gospels. According to Eusebius (*Onom.*, ed. Lagarde, p. 265) Jericho was destroyed at the time of the fall of Jerusalem, and a new town sprang up, from which he distinguishes the ruins of two earlier cities as still visible. To the third Jericho, which was an episcopal city, may be referred the Byzantine remains immediately east of Tell es Sultân. The present village of Rîhâ or Arîhâ, which stands nearly half an hour southeast of the Sultan's Spring, is a still more modern site, with a square tower of crusading date. Yákút, in the beginning of the 13th century, still speaks of Jericho as producing dates, bananas, and excellent sugar, but all these have disappeared with the gradual decay of the place. The modern village is but a group of squalid huts, and the ancient groves are represented by a thicket of the *Spina Christi* and other trees between the village and the Sultan's Spring.

JEROME, ST. (HIERONYMUS, in full EUSEBIUS SOPHRONIUS HIERONYMUS), was born at Strido (modern Strigau?), a town on the border of Dalmatia fronting Pannonia, destroyed by the Goths in 377 A.D. Some authorities, following Prosper's chronicle, give 330 or 331 as the date of his birth, but from certain passages in his writings it is more probable that he was not born till 340 or 342. He says, for example, that he was a boy learning grammar when Julian died; but Julian died in 363, and Jerome would scarcely call himself a boy if he had been thirty-three years old. What is known of Jerome has mostly been recovered from his own writings, for he was a gossiping sort of man, and biographers have only to string together extracts from his epistles and prologues to get a very good account of his life. His parents were Christians, orthodox though living among people mostly Arians, and wealthy. He was at first educated at home, Bonosus, a life-long friend, sharing his boyish studies, and was afterwards sent to Rome to perfect his education. Donatus, whose Latin grammar was to be the plague of generations of mediæval school-boys from St. Andrews to Prague till Corderius and the Reformation drove it out, taught him grammar, and explained the Latin poets. Victorinus taught him rhetoric. He attended the law-courts, and listened to the Roman advocates pleading in the Forum. He went to the schools of philosophy, and heard lectures on Plato, Diogenes, Clitomachus, and Carneades; the conjunction of names shows how philosophy had become a dead tradition. His Sundays were spent in the catacombs in discovering graves of the martyrs and deciphering inscriptions.

Pope Liberius baptized him in 360; three years later the news of the death of the Emperor Julian the Apostate came to Rome, and Christians felt relieved from a great dread.

When his student days were over, Jerome returned to Strido, but did not stay there long. His character was formed. He was a scholar, with a scholar's tastes and cravings for knowledge, easily excited, bent on scholarly discoveries. From Strido he went to Aquileia, where he formed some friendships among the monks of the large monastery there, the most notable being his acquaintance with Rufinus, with whom he was destined to quarrel bitterly over the question of Origen's orthodoxy and worth as a commentator; for Jerome was a man who always sacrificed a friend to an opinion, and when he changed sides in a controversy expected his acquaintances to follow him. From Aquileia he went to Gaul, visiting in turn the principal places in that country, from Narbonne and Toulouse in the south to Treves on the northeast frontier. He stayed some time at Treves studying and observing, and it was there that he first began to think seriously upon divine things. From Treves he returned to Strido, and from Strido to Aquileia. He settled down to literary work in Aquileia, and composed there his first original tract *De Muliere septies percussa*, in the form of a letter to his friend Innocentius. Some quarrel, no one knows what, caused him to leave Aquileia suddenly; and with some companions, Innocentius, Evagrius, and Heliodorus being among them, he started for a long tour in the East. The epistle to Rufinus (3d in Vallarsi's enumeration) tells us the route. They went through Thrace, visiting Athens, Bithynia, Galatia, Pontus, Cappadocia, and Cilicia, to Antioch, Jerome observing and making notes as they went. He was interested in the theological disputes and schisms in Galatia, in the two languages spoken in Cilicia, etc. At Antioch the party remained some time. Innocentius died of a fever, and Jerome was dangerously ill. This illness brought him face to face with death; he experienced conversion, and resolved to renounce whatever kept him back from God. His greatest temptation was the study of the literature of pagan Rome. In his dreams God reproached him with caring more to be a Ciceronian than a Christian. He disliked the uncouth style of the Scriptures. "O Lord," he prayed, "Thou knowest that whenever I have and study secular MSS. I deny Thee," and he made a resolve henceforth to devote his scholarship to the Holy Scriptures. "David was to be henceforth his Simonides, Pindar, and Alcæus, his Flaccus, Catullus, and Severus." Fortified by these resolves, he betook himself to a hermit life in the wastes of Chalcis. Chalcis was the Thebaid or the Marseilles of Syria, Great numbers of monks, each in solitary cell, spent lonely lives, scorched by the sun, ill-clad and scantily fed, pondering on portions of Scripture or copying MSS. to serve as objects of meditation. Jerome at once set himself to such scholarly work as the place afforded. He discovered and copied MSS., and began to study Hebrew. There also he wrote the life of St. Paul of Thebes, probably an imaginary tale embodying the facts of the monkish life around him. Just then the Meletian schism, which had to do with the relation of the orthodox to Arian bishops and to those baptized by Arians, distressed the church at Antioch, and Jerome as usual eagerly joined the fray. Here as elsewhere he had but one rule to guide him in matters of doctrine and discipline,—the practice of Rome and the West; for it is singular to see how Jerome, who is daringly original in points of scholarly criticism, was simply a ruthless partisan in all other matters; and, having discovered what was the Western practice, he set tongue and pen to work with his usual bitterness (*Altercatio Luciferiani et Orthodoxi*). From Antioch he went to Constantinople, where he met with the great eastern scholar and theologian Gregory of Nazianzus, and with his aid tried to perfect himself in Greek. The result of his studies there was the translation of the *Chronicon* of Eusebius, with a continuation,[1] of twenty-eight homilies of Origen on Jeremiah and Ezekiel, and of nine homilies of Origen on the Visions of Isaiah.

In 381 Meletius died, and Pope Damasus interfered in the dispute at Antioch, hoping to end it. Jerome was called to Rome in 382 to give help in the matter, and was made secretary during the investigation. His work brought him into intercourse with this great pontiff, who soon saw what he could best do, and how his vast scholarship might be made of use to the church. Damasus suggested to him to revise the existing Latin translation of the Bible; and to this task he henceforth devoted his great abilities (see BIBLE). At Rome were published the Gospels (with a dedication to Pope Damasus, and explanatory introduction, and the canons of Eusebius), the rest of the New Testament, and the version of the Psalms from the LXX. text, known as the *Psalterium Romanum*, which was followed in 385 by the *Psalt. Gallicanum*, based on the Hexaplar Greek text. These scholarly labors, however, did not take up his whole time, and it was almost impossible for Jerome to be long anywhere without getting into a dispute. He was a zealous defender of that monastic life which was beginning to take such a large place in the church of the 4th century, and he found enthusiastic disciples among the Roman ladies. A number of widows and maidens met together in the house of Marcella to study the Scriptures with him; he taught them Hebrew, and preached the virtues of the celibate life. His arguments and exhortations may be gathered from many of his epistles and from his tract *Adversus Helvidium*, in which he defends the perpetual virginity of the Virgin Mary against Helvidius, who maintained that Mary bore children to Joseph. His influence over these ladies alarmed their relations, and excited the suspicions of the regular priesthood and of the populace, but while Pope Damasus lived Jerome remained secure. Damasus died, however, in 384, and was succeeded by Siricius, who did not show much friendship for Jerome. He found it expedient to leave Rome and set out for the East in 385. His letters (especially Ep. 45) are full of outcries against his enemies and of indignant protestations that he had done nothing unbecoming a Christian, that he had taken no money, nor gifts great nor small, that he had no delight in silken attire, sparkling gems, or gold ornaments, that no matron moved him unless by penitence and fasting, etc. His route is given in the third book *In Rufinum;* he went by Rhegium and Cyprus, where he was entertained by Bishop Epiphanius, to Antioch. There he was joined by two wealthy Roman ladies, Paula, a widow, and Eustochium her daughter, one of Jerome's Hebrew students. They came accompanied by a band of Roman maidens vowed to live a celibate life in a nunnery in Palestine Accompanied by these ladies Jerome made the tour of Palestine, carefully noting with a scholar's keenness the various places mentioned in Holy Scripture. The results of this journey may be traced in his translation with emendations of the book of Eusebius on the situation and names of Hebrew places, written probably three years afterwards, when he had settled down at Bethlehem. From Palestine Jerome and his companions went to Egypt, remaining some time in Alexandria; and they visited the convents in the Nitrian desert. Jerome's mind was evidently full of anxiety about his translation of the Old Testament, for we find him in his letters recording the conversations he had with learned men about disputed readings and doubtful renderings; Didymus of Alexandria appears to have been most useful. When they returned to Palestine they all settled at Bethlehem, where Paula built four monasteries, three for nuns and one for monks. She was at the head of the nunneries until her death

---

[1] Comp. Schoene's critical edition (Berlin, 1866, 1875).

in 404, when Eustochium succeeded her; Jerome presided over the fourth monastery. In this monastery at Bethlehem Jerome did most of his literary work, and, throwing aside his unfinished plan of a translation from Origen's Hexaplar text, translated the Old Testament directly from the Hebrew, with the aid of Jewish scholars. He mentions a rabbi from Lydda, a rabbi from Tiberias, and above all Rabbi Ben Anina, who came to him by night secretly for fear of the Jews. Jerome was not familiar enough with Hebrew to be able to dispense with such assistance, and he makes the synagogue responsible for the accuracy of his version: "Let him who would challenge aught in this translation," he says, "ask the Jews." The result of all this labor was the Latin translation of the Scriptures, which, in spite of much opposition from the more conservative party in the church, afterwards became the Vulgate or authorized version; but the Vulgate as we have it now is not exactly Jerome's Vulgate, for it suffered a good deal from changes made under the influence of the older translations; the text became very corrupt during the Middle Ages, and in particular all the Apocrypha, except Tobit and Judith, which Jerome translated from the Chaldee, were added from the older versions.[1]

Notwithstanding the labor involved in translating the Scriptures, Jerome found time to do a great deal of literary work, and also to indulge in violent controversy. Earlier in life he had a great admiration for Origen, and translated many of his works, and this lasted after he had settled at Bethlehem, for he translated in 389 Origen's homilies on Luke; but he came to change his opinion and wrote violently against the admirers of the great Alexandrian scholar, *Contra Joannem Hierosolymitanum*, and *Adversus Rufinum Lib. III.*, for both John, bishop of Jerusalem, and Rufinus, Jerome's old friend were followers of Origen. At Bethlehem also he found time to finish *Didymi de Spiritu Sancto Liber*, a translation begun at Rome at the request of Pope Damasus, to denounce the revival of Gnostic heresies by Jovinianus and Vigilantius (*Adv. Jovinianum Lib. II.* and *Contra Vigilantium Liber*), and to repeat his admiration of the hermit life in his *Vita S. Hilarionis Eremitæ*, in his *Vita Malchi Monachi Captivi*, in his translation of the Rule of St. Pachomius (the Benedict of Egypt), and in his *S. Pachomii et S. Theodorici Epistolæ et Verba Mystica.* He also wrote at Bethlehem *De Viris illustribus sive de Scriptoribus Ecclesiasticis*, a church history in biographies, ending with the life of the author; *De Nominibus Hebraicis*, compiled from Philo and Origen; and *De Situ et Nominibus Locorum Hebraicorum.*[2] At the same place, too, he wrote *Quæstiones Hebraicæ* on Genesis,[3] and a series of commentaries on Isaiah, Jeremiah, Ezekiel, Daniel, the Twelve Minor Prophets, Matthew, and the Epistles of St. Paul. Jerome engaged in the Pelagian controversy with more than even his usual bitterness (*Dialogi contra Pelagianos*); and it is said that the violence of his invective so provoked his opponents that an armed mob attacked the monastery, and that Jerome was forced to flee and to remain in concealment for nearly two years. He returned to Bethlehem in 418, and after a lingering illness died on September 30, 420.

By far the best edition of Jerome's works is that of Vallarsi (Verona, 1734–42), which contains in prefaces and appendices almost all that is known of the great Western scholar. The student will find the article on "Hieronymus" by Cölln in Ersch and Gruber's *Encyclopädie* very useful, and the English reader will find a succinct account of his writings taken from Vallarsi in Smith's *Dict. of Greek and Roman Biography and Mythology*, art. "Hieronymus." (T. M. L.)

JEROME OF PRAGUE (*c.* 1365–1416), the friend and disciple of John Huss, derives the surname by which he is best known from his native town, where he was born somewhere betwen 1360 and 1370. His family name is sometimes, but erroneously, said to have been Faulfisch. After completing his studies in the university of Prague, he proceeded (about 1396) to Oxford, where in course of a residence of some duration he became acquainted with the teaching and writings of Wycliffe, of which he became a zealous disseminator on his return to his native land. In 1398 he took his bachelor's degree at Prague, and then visited Paris, Heidelberg, and Cologne; at the first-mentioned university he seems to have graduated as master of arts. Returning about 1407 to Prague, he took a prominent part with Huss in the university disputes which led to the withdrawal of the German "nation." So great did his reputation for learning, energy, and sagacity become that he was employed by Ladislaus II., king of Poland, in 1410, to assist in placing the university of Cracow upon a proper footing, while by Sigismund, king of Hungary, he was, although not in orders, invited to preach before him at Ofen. His public discourses in Hungary, however, soon brought him under suspicion of Wycliffite heresy, and he found it necessary to fly the country; taking refuge in Vienna, he was there arrested and thrown into prison, but on the intervention of his friends in Prague obtained his release. He now again became closely associated with Huss in his native city, to which he had once more returned, and where he remained after the expulsion of his friend. In 1415 he went spontaneously to Constance, determined to do what he could for Huss, who had meanwhile been imprisoned there; the news he received on his arrival was so discouraging, however, that, panic-stricken, he immediately again withdrew. Though without a safe conduct, he would no doubt have reached Prague in safety had he only been able to hold his peace; but while resting at Hirschau he allowed his feelings to gain the mastery of him, and, in the presence of many clergy, broke out in vehement denunciation of the injustice of the council; the consequence was that he was forthwith arrested by order of the duke of Bavaria and sent back a prisoner to Constance (May, 1415). There, after enduring the most rigorous confinement for some months, he was brought before a public session of the council on September 23, 1415, when he made a full retraction of all errors against the Catholic faith, especially those of Wycliffe and Huss. His enemies, however, were determined that not even thus should he escape their hands; by Michael de Causis and Stephen Palecz (who also had made themselves conspicuous in the persecution of Huss) it was declared that the recantation was ambiguous, and new articles were exhibited against their victim. Thrice again he was brought before a general congregation of the council. On the last of these occasions (May 26, 1416) all his timidity seems to have finally left him. In a bold and vigorous declamation he solemnly retracted the retractation which had been wrung from him eight months before; "of all the sins that I have committed since my youth, none weigh so heavily on my mind and cause me such keen remorse as that which I committed in this evil place when I approved of the iniquitous sentence given against Wycliffe and against the holy martyr John Huss, my master and friend." Four days afterwards he was condemned as a relapsed heretic; his reply was an appeal to the supreme Judge before whom he and his accusers alike were destined to stand. Two days later he marched with a cheerful countenance to the stake, bidding the executioner light the fire before his face; "had I the least fear, I should not be standing in this place." His ashes, like those of Huss, were gathered and thrown into the Rhine. Jerome owes his fame to his association with Huss, and particularly to the splendid heroism with which in his death he atoned for one moment of faltering in his loyalty to the doctrines to which he had faithfully devoted his life. No literary remains survive by which we might estimate with precision how far the claims to learning and superiority of intellect often made for him can be justified. Of absolute originality he obviously had none. The truth seems to be that, with considerable advantages of birth and early training, and with a mind more variously accomplished than that of Huss, he nevertheless wanted the moral weight which gave his master so great an ascendency over the minds and hearts of men. Bold even to rashness, his courage was shown rather in bursts of furious vehemence than in the equable tenor of his life, and more than once failed him in critical moments. In this weakness he only reflected the turbulent and unruly spirit of the age he lived in; but it is also a weakness that sufficiently justifies history in assigning to him a comparatively subordinate though still highly honorable place among the pioneers of the Reformation.

JERROLD, Douglas William (1803–1857), dramatist, satirist, and one of the most brilliant of the English wits who distinguished the first half of the 19th century, was born in London, January 3, 1803. His father, Samuel Jerrold, actor, was at that time lessee of the little theatre of Wilsby near Cranbrook in Kent, but in 1807 he removed to Sheerness. There, among the blue-jackets who swarmed in the port during the war with France, little Douglas grew into boyhood, a stout, well-made, rosy-cheeked, white-haired urchin, fond of reading and pugnacious withal. Familiarity with the tinsel and glitter of his father's profession robbed it of its chief attractions for the boy; but the glorious renown of Nelson and the anti-Gallic enthusiasm of his father's naval patrons filled his susceptible bosom, and wooed him to his majesty's uniform. From December, 1813, till October, 1815, Douglas Jerrold served his country as a midshipman. He saw nothing of the war save a cargo of maimed warriors from Waterloo; but till his dying day there lingered traces of his early passion for salt water. The peace of 1815 ruined poor Samuel Jerrold; there was no more prize money. On January 1, 1816, he removed with his family to London, where the plucky little ex-midshipman began the world again as a printer's apprentice, studying hard in the gray of the early morning at Latin, pinching himself to get the *Waverley Novels* from the library, and finding unspeakable delight in the pages of his *Shakespeare.* In 1819 Douglas Jerrold was a compositor in the printing-office of the *Sunday Monitor*. Several short papers and copies of verses by him had already appeared in the sixpenny magazines, but he aspired now to contribute to the *Monitor;* and stealthily one evening he dropped into the editor's box a critique of the opera *Der Freischütz.* Next morning he received his own copy to set up, together with a flattering note from the editor, requesting further contributions from the anonymous author. Thenceforward Jerrold was engaged in journalism.

He soon entered another field where he was to reap no less honorable laurels. In 1821 he had the satisfaction of seeing a comedy that he had composed in his fifteenth year brought out at Sadler's Wells Theatre, under the title *More Frightened than Hurt.* Other pieces followed, and in 1825 the popular young dramatist was engaged for a few pounds weekly to produce dramas and farces to the order of Mr. Davidge of the Coburg Theatre. By his marriage in the autumn of 1824 the "little Shakespeare in a camlet cloak," as he was called, had found a less fitful incentive to industry than his mere ambition; and, while he was engaged with the drama at night, he was steadily pushing his way as a journalist by his daily labors. For a short while he was part proprietor of a small Sunday newspaper. In 1829, through a fortunate quarrel with the exacting Davidge, Jerrold left the "Coburg," and *Black-Eyed Susan* was brought out on the "Surrey" boards. The success of the piece was enormous. With its free gallant sea-flavor, it took the town by storm, and "all London went over the water to see it." On the three hundredth night the theatre was illuminated. Elliston, manager of the "Surrey," made thousands of pounds; T. P. Cooke, who played William, made his reputation; Jerrold received about £70. But his fame as a dramatist was achieved. In 1830 it was proposed that he should adapt something from the French for Drury Lane. "No," was his reply to the offer, "I shall come into this theatre as an original dramatist or not at all." In December of the following year he was received on his own terms; *The Bride of Ludgate* was the first of a number of plays which found their way to Drury Lane stage. The other patent houses threw their doors open to him also (the Adelphi had already done so); and in 1836 Jerrold himself became co-manager of the Strand Theatre with Mr. Hammond his brother-in-law. The venture was not successful; and the partnership was dissolved. While it lasted Jerrold wrote his only tragedy, *The Painter of Ghent*, and appeared himself in the title rôle, without any very marked success. His pen continued to be fruitful of sparkling comedies till 1854, when his last piece, *The Heart of Gold*, was written.

Meanwhile he had won his way to the pages of numerous periodicals.—before 1830 of the second-rate magazines only, but after that to those of more importance; and he had almost reached comfort and ease when an obligation, undertaken for an unfortunate friend, drove him forth to fresh years of hard toil. When at last he could settle in comfort he found himself the centre of a host of friends, whose affection was his no less than their admiration; and his last years were spent in peaceful happiness. The *Monthly Magazine*, *Blackwood's*, the *New Monthly*, and the *Athenœum*, all welcomed his brilliant articles. To *Punch*, the publication which of all others is associated with his name, he contributed from its second number in 1841 till within a few days of his death. He founded and edited for some time, though with indifferent success, the *Illuminated Magazine*, *Jerrold's Shilling Magazine*, and *Douglas Jerrold's Weekly Newspaper*, and under his editorship *Lloyd's Weekly Newspaper* rose from almost nonentity to a circulation of 182,000. The history of his later years is little more than a catalogue of his literary productions, interrupted now and again by brief flights to the Continent or to the country. Douglas Jerrold died at his house, Kilburn Priory, in London, on June 8, 1857.

Jerrold's figure was small and spare, and in later years bowed almost to deformity. His features were strongly marked and expressive, from the thin humorous lips to the keen blue eyes gleaming from beneath the shaggy eyebrows. He was brisk and active, with the careless bluffness of a sailor. Open and sincere, he concealed neither his anger nor his pleasure; to his simple frankness all polite duplicity was distasteful. Hating the conventionalities of the town, he loved to make his home in some rural retreat where he could roam at ease, with loose coat and straw hat. To his house, always hospitable, he was especially fond of attracting young men, whom he encouraged with strong, cheery words, and often with more material aid. The cynical side of his nature he kept for his writings; in private life his hand was always open. In politics Jerrold was a Liberal, and he gave eager sympathy to Kossuth, Mazzini, and Louis Blanc. In social politics especially he took an eager part; he never tired of declaiming against the horrors of war, the luxury of bishops, and the iniquity of capital punishment.

Douglas Jerrold is now perhaps better known from his reputation as a brilliant wit in conversation than from his writings. In animated talk his retorts and fancies flew from his lips like a shower of sparks. His jests were unpremeditated and unforced; their spontaneity, which not seldom surprised Jerrold himself, was one of their most telling characteristics, and often robbed his sharpest retorts of their sting. For he let no sentimental or polite consideration stand in the way of a brilliant rejoinder. As Dr. Charles Mackay expresses it, "when his jest came to the tip of his tongue, it had to explode though the heavens should crack, and his best friend should take it amiss." Yet no one can accuse Jerrold of being spiteful. Ill-advised and thoughtless, even unjust, his wit often was; but it was not barbed. It did not rankle in the wound. Jerrold's wit was of a tolerably high intellectual order. It is said that no pun is to be found in his writings. Their wit is the wit of burnished epigram and quaint conceit, of happy phrase and lightning retort. But the puns that abounded in his talk were often wise as well as witty. The well-known description of dogmatism as "puppyism come to maturity" is an excellent example of the flashing insight that gave life and meaning to his jests.

As a dramatist Jerrold was very popular, and struck out quite a line for himself in the domestic drama. Here he dealt with rather humbler forms of social life than had commonly appeared on the stage; and it is worthy of note that plays of this kind have had the greatest run in modern times. Jerrold was one of the first and certainly one of the most successful of those who in defence of the native English drama endeavored to stem the tide of translation from the French, which threatened early in the 19th century altogether to drown original native talent. Thoroughly English in motive, action, and atmosphere, his plays, whether comedy or domestic drama, are all effective from their freshness, point, and spirit. The author is at his best in construction as well as in sparkling epigram and brilliant dialogue in *Bubbles of the Day*, and *Time Works Wonders*. The latter perhaps excels in plot and human interest. The tales and sketches which form the bulk of Jerrold's collected works vary much in skill and interest; but, although the artistic symmetry is here and there marred by traces of their having been composed from week to week, they are always marked by keen satirical observation and pungent wit. While reading them it is well to remember that they have a higher aim than the beguiling an idle hour by the mere interest of the story; for the author is always trying to call attention to some wrong, to rouse pity for some hardship, to stir up indignation against some form of social oppression or abuse.

Jerrold's writings are scattered over all the periodical literature of his day; but perhaps his most important works are in the following list. *Men of Character* are seven sketches (collected in 1838), in which he throws sarcastic ridicule on various foibles and hypocrisies of every-day men; *Cakes and Ale*, a collection of short papers of all sorts made in 1842, contains whimsical tales directed against the tyranny of riches, the folly of judging by appearances, with similar thrusts at the weaknesses and vices of humanity; *The Story of a Feather*, which originally appeared in *Punch* in 1842–43, tracing the career of an ostrich feather as it passes to successive owners, affords the author opportunities of exposing shams, lashing vice, and gibbeting successful villany in every rank of life. In *The Chronicles of Clovernook* he ventilates his philosophy of life, and his objections to existing social and political institutions; in *A Man Made of Money*, where the supernatural forms the basis for a story of an eminently matter-of-fact character, he fulminates against the blind worship of lucre; *St. Giles and St. James*, perhaps his best work of this class, is described in his own words as "an endeavor to show in the person of St. Giles the victim of an ignorant disregard of the social claims of the poor upon the rich, . . . to present . . . the picture of the infant pauper reared in brutish ignorance." Of his professedly satirical papers the chief are *Punch's Letters to his Son*, *Punch's Complete Letter-Writer*, and *Sketches of the English*. *Mrs. Caudle's Curtain Lectures*, possibly the most widely known of all Jerrold's writings, explain themselves by their title. Besides the "Q Papers," which began in the second number of *Punch*, Jerrold wrote various political articles for his own and other newspapers.

Were a reader now to go to Jerrold's writings, he would find much that seems commonplace and trite. The fault is not with Jerrold, but with the host of his imitators, who have sought with more or less success to reproduce in the pages of every magazine the social cynicism which is apt at first view to be taken for the essence of Jerrold's style. But Jerrold had his own happy knack of handling ordinary subjects, his own singular method of regarding things. His truths may sometimes be commonplaces, and his moralizings trite; his descriptions may sometimes drag on to tedium, and his characters stiffen into lay figures; even his passion may sometimes attenuate to fustian, but every paragraph is lit up by quaint phrase or happy conceit; every page is illumined by some gleaming epigram or flash of originality. Jerrold seems to revel in the sarcastically satirical, perhaps the easiest and most directly effective of all satire. He appears to have reserved the softer side of his nature for his private life. He is far more at home in satirizing the foibles of men than in praising their good points. Here and there there are tender gleams of rarest pathos in his pages; but these do not occur in scenes elaborated to move pity, but in the simple half unconscious finishing touch to some little picture, drawn from the author's heart. That Jerrold has painted for us no full-length portrait of a thoroughly noble character is due to his ultra-keen perception of the bad in human nature. "Mr. Capstick" in *St. Giles and St. James*, who is perhaps the most truly benevolent of all his personages, escapes the difficulty of revealing his excellence in consistent speech by becoming an amiable hypocrite, and poses as "the man with gall in his words and balm in his deeds."

A writer in the *Edinburgh Review* for 1859 accuses Jerrold of being a "sentimentalist,"—of writing "to gratify his sympathies and antipathies, and not to bring out the truth." That is an extreme statement, which has some foundation in fact. Jerrold often attacked what he considered an abuse without stopping to weigh the ultimate consequences, and without being swayed by very satisfactory or conclusive reasons. Sometimes too the epigram or the jest seems to have suggested the opinion, rather than the opinion the epigram. That he generally espoused the healthy side was due more to his instinct than to his reason, more to his heart than to his head. His keen feelings often carried him to great lengths in invective. He did not escape the besetting sin of all social reformers. He is tempted to elaborate and intensify the peculiar aspect of the question that best suits the lesson he seeks to read; and although it is impossible to doubt his perfect sincerity and honest intention, yet the darkening of the shadows has a disingenuous air, and we are tempted to suspect that he has been unconsciously impelled to exaggerate reality or distort fact in order to justify his diatribe. Such a suspicion is fatal to satire. It enlists our sympathies, on a most healthy principle, on the side of what is attacked; and it is the cause why so much of what Jerrold wrote has missed fire. This fault of coloring, which earnest social satire can scarcely escape, has been commonly translated by critics as "bitterness"; but bitterness is far too ill-natured a word to describe the vivid, quivering feeling in which there is not the faintest tincture of personal animus, and in which all the sharpness is on behalf of the poor and the oppressed, with whom his own life had taught him sympathy.

Douglas Jerrold's *Works* were collected by himself in 8 vols. 8vo., 1851–55, and again in 4 vols. 8vo in 1859. *The*

Life and Remains of Douglas Jerrold, by his son Blanchard Jerrold, was published in 1858; 2d ed., 1869. (F. MU.)

JERSEY, the largest and most important of the CHANNEL ISLANDS (*q.v.*), is situated between 49° $15\frac{1}{2}'$ and 49° 10′ N. lat., and between 2° $0\frac{3}{4}'$ and 2° $15\frac{1}{2}'$ W. long., 16 miles west of Normandy and 125 south of Southampton. The total area comprises 28,717 imperial acres, or about 45 square miles. It is of oblong form, with a length of about 11 miles from east to west, and an average breadth of about $5\frac{1}{2}$ miles. Along the northern part of the island a belt of elevated land runs from east to west, displaying bold and picturesque cliffs towards the sea. The east, south, and west coasts consist of a continuous succession of large open bays with marshy or sandy shores terminated by rocky headlands. The principal bays are Grève au Lançon, Grève de Lecq, and Bouley Bay on the north coast; St. Catherine's Bay and Grouville Bay on the east coast; St. Clement's Bay, Samarez Bay, St. Aubin's Bay, and St. Brelade's Bay on the south coast; and St. Ouen's Bay on the west coast. The sea in many places has encroached greatly on the land, and sand drifts have been found very troublesome, especially on the west coast. The surface of the country is broken by winding valleys having a general direction from north to south, and as they approach the south uniting so as to form small plains. The lofty hedges which bound the small enclosures into which Jersey is divided, the trees and shrubbery which line the roads and cluster round the uplands and in almost every nook of the valleys unutilized for pasturage or tillage, give the island a rich and luxuriant appearance, and completely neutralize the bare effect of the few sandy plains and sand-covered hills. Some of the coast scenery is grand and striking, presenting many features of special interest.

According to J. A. Bird ("Geology of the Channel Islands," in the *Geological Magazine*, London, 1878), Jersey rests on syenite rocks, which appear in three great masses in the northwest, southwest, and southeast of the island. Between these masses there is in the west an extensive formation of shale and schist, and in the northwest a formation variously composed of porphyries, limestone schist, altered sandstone, quartzite and quartzose conglomerate. In the neighborhood of St. Helier there is an accumulation of volcanic rocks consisting of trap, porphyry, and amygdaloid. China stone clay is obtained in large quantities. There are some veins of lead, and ironstone is occasionally found. The climate of Jersey is somewhat warmer in summer and colder in winter than that of Guernsey. The annual mean temperature is 51°, the annual rainfall about $30\frac{1}{2}$ inches, and the number of days upon which rain falls about one hundred and fifty. The wettest season is from October to January, but rain seldom continues long. The island enjoys a very early spring and a lengthened autumn. Snow and frost are rare, but dense fogs frequently prevail. Fruits and flowers indigenous to warm climates grow freely in the open air. The land is rich and very productive, the soil being chiefly a deep loam, which is lighter upon syenite and granite than upon the other formations; the sandy portions in the vicinity of the bays have become very fruitful through cultivation. The lands are held either as freeholds or on a nine years' lease. On account of the Norman law of succession the farms have become very much subdivided. It is only rarely that they exceed 50 acres, and very many are less than 3 acres. The farmhouses and cottages are remarkably neat and comfortable; and the peasantry, who all farm their own land, are perhaps the most contented and prosperous in the United Kingdom. A five-course shift (turnips, potatoes or parsnips, wheat, hay, hay) is that usually followed. The frequency with which root crops are grown, and the abundant supply of sea manure, have greatly enriched the soil. The seaweed or *vraic* harvest occurs at certain seasons which are prescribed by law. It is only then that it is permissible to cut the vraic from rocks; but loose vraic is gathered in large quantities at all seasons. The implements of husbandry are generally old-fashioned. The peasantry take advantage of every bit of wall and every isolated nook of ground for growing fruit trees. Grapes are ripened under glass; oranges are grown in sheltered situations, but the most common fruits are apples, which are used for cider, and pears. The island is intersected by a network of roads. There is a railway line between St. Helier and St. Aubin's and connects St. Helier and Gorey.

According to the agricultural returns for 1880 the total area of arable land was 18,950 acres,—a percentage of 66.2 to the total area,—of which 2920 acres were under corn crops, 7456 under green crops, 4359 under rotation grasses, 4087 under permanent pasture, and 128 fallow. Under orchards there were 1345 acres, under market gardens 186, and under nursery grounds 38. Wheat, which in 1880 occupied 2524 acres, is the principal and almost exclusive corn crop, the kinds grown being principally Velouzé and Petit Blanc. For the crop a manure of burnt seaweed is generally used. The area under potatoes in 1880 was 4671 acres, They are grown chiefly for the Covent Garden Market, the earliest crop being ready about the end of April or beginning of May. Only 1313 acres were under turnips. The pasturage is very rich, and is much improved by the application of seaweed to the surface. The mainstay of Jersey is cattle, which in 1880 numbered 11,022, or the large average of 58 to every 100 acres under cultivation, the average of the United Kingdom being only 20·7. The breed is that commonly known as the Alderney, and is kept pure by stringent laws against the importation of foreign animals. The number of cows was 5884, of other cattle above two years of age only 756, and of cattle below two years of age 4382. It will thus be seen that cattle are kept chiefly for dairy purposes. The milk is used almost exclusively to manufacture butter. The cattle are always housed in winter, but remain out at night from May till October. Horses in 1880 numbered 2261. Originally there was a small black breed of horses peculiar to the island, but now they are chiefly imported from France or England. Pigs form the staple food of the inhabitants, and numbered 5844. Only a few sheep are kept, 346 in 1880.

The number of ships that entered the ports of Jersey in 1879 was 2001, of 281,663 tons burden,—British vessels numbering 1859, of 275,990 tons, and foreign vessels 142, of 5673 tons. In the same year 2018 vessels, of 279,485 tons burden, cleared,—British vessels numbering 1876, of 273,319 tons, and foreign vessels 142, of 6166 tons. The number of vessels belonging to the island was 234, with a burden of 17,027 tons, in addition to which there is a large number of fishing boats. There is regular steam communication with England *via* Southampton, Weymouth, and Plymouth, and with France *via* Granville and St. Malo. The principal exports are granite, fruit, and vegetables (especially potatoes), oysters, butter, and cattle; and the principal imports coal, wine, rum, and other spirituous liquors, sugar, tea, wheat, and eggs. Kelp and iodine are manufactured from seaweed. Fish are not so plentiful as around the shores of Guernsey, but mackerel, turbot, cod, mullet and especially the conger eel, are abundant at the Minquiers. There is a large oyster bed between Jersey and France, but partly on account of over-dredging the supply is not now so abundant as formerly. There is a great variety of other shell-fish. The islanders build their own ships.

Jersey is under a distinct and in several respects different form of administrative government from Guernsey and the smaller islands included in the bailiwick of Guernsey. The administration is under the superintendence of a lieutenant-governor appointed by the crown. The main business of legislature in Jersey is carried on by the "states," which consist of the bailiff or judge of the royal court elected by the crown, twelve jurats of the royal court elected for life by the ratepayers, the rectors of the twelve parishes, twelve constables elected every three years, and fourteen deputies elected every three years. The lieutenant-governor has a deliberative voice, and, though he has no vote, has the power of veto. The states have the power of passing *ordonnances* which unless they obtain the sanction of the sovereign of England are in force for only three years. English Acts of Parliament after registration become laws in Jersey. Taxation is very light in the island. The only legal tribunal is the royal court, composed of the bailiffs and twelve jurats. The lieutenant-governor has the superintendence of the militia, in which every male between seventeen and sixty-five years of age, who is medically fit, is liable for service. Jersey is divided into twelve parishes, and ecclesiastically it constitutes a deanery in the diocese of Winchester in England.

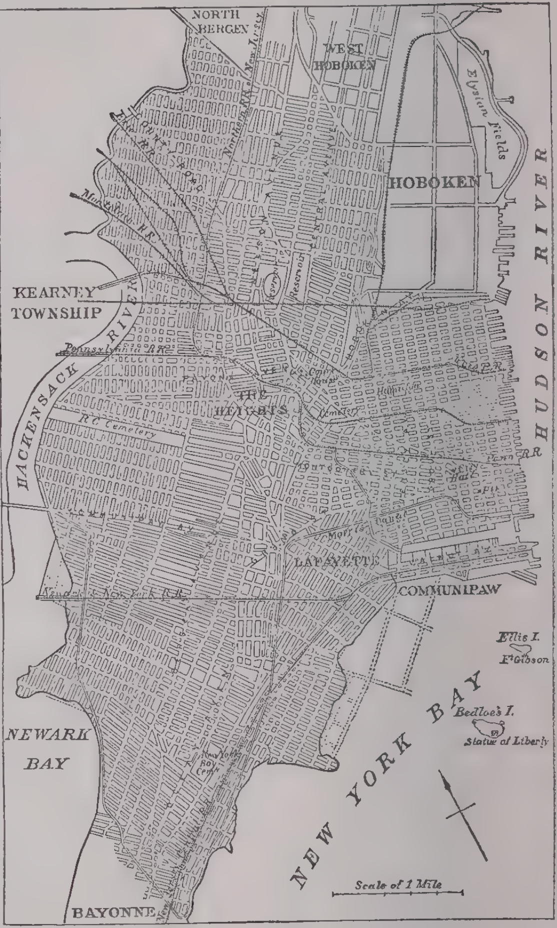
The only town of importance is St. Helier, situated on St. Aubin's Bay. It has rather a mean and uninteresting appearance, but beautiful views are obtained from various points. Although the streets are generally narrow and irregular, they are clean and well paved, and the Royal Square is spacious and airy. The town possesses an outer and an inner harbor. Fort Regent, a fortress completed in 1815 at a cost of £1,000,000, is situated on a lofty ridge of granite to the east of the harbor; and on the rocks to the west stands Elizabeth Castle, a disused stronghold erected in the time of Elizabeth on the site of an abbey founded in the 12th century. Closely adjoining it there is an ancient ruin called the hermitage. The other principal buildings are the parish church in the Early Pointed style, dating from 1341, and lately completely renovated, the court-house, the Albert Hall for concerts and assemblies, Victoria College, the hospital, and the jail. The population of the town and parish in 1881 was 26,893.

The population of Jersey in 1806 was 22,855. From 1821, when it numbered 28,600, it increased rapidly till 1851, when it had reached 57,020. In 1861 it had declined to 55,613; and, although owing to the number of French who sought refuge in the island it increased in 1871 to 56,627, in 1881 it was only 52,372, of whom 23,415 were males and 28,957 females.

An historical account of Jersey will be found under Channel Islands. The principal objects of antiquarian interest are the cromlech near Mont Orgueil, the castle of Mont Orgueil, of very old date; St. Brelade's Church, the oldest church in the island, and dating from the 12th century; the remains of an old chapel on whose site Prince's Tower was erected at the close of the last century; and Bel Royal, a cottage near St. Helier, where Charles II. is said to have concealed himself.

Lyte, *Sketch of the History and Present State of the Island of Jersey*, 1808; *History of the Island of Jersey*, 1840; Charles Le Quesne, *A Constitutional History of Jersey*, 1856; François-Victor Hugo, *La Normandie Inconnue*, 1857; *Report of the Commission appointed to Enquire into the Civil, Municipal, and Ecclesiastical Laws of Jersey*, 1861; Le Hericher, *Jersey monumental et Historique*, 1862; Le Cerf, *L'Archipel des Isles Normandes*, 1863; Lefevre, "Channel Islands," in the *Fortnightly* for October, 1879; "L'île de Jersey," in the *Explorateur* for 1876; Pegot-Ogier, *Histoire des Îles de la Manche*, 1881.

JERSEY CITY, the chief city of Hudson county in the State of New Jersey, U. S., is situated on the west bank of the Hudson, opposite New York, to which it stands in a relation similar to that of Birkenhead to Liverpool. It is laid out irregularly, owing to its being an aggregation of three formerly distinct municipalities. Many of the streets are broad and well paved, and the city is provided with efficient gas, water, and sewerage systems. It has few striking buildings, the most prominent structures being the immense grain elevators near the river, three hospitals, an orphans' home, and the public school buildings, 21 in number. The public schools are supported by State and city taxes, and administered by a board of education. The trade of the city is very considerable; but, as it is embraced in the New York customs district, separate returns are not made. The fact that it is a terminus for three lines of ocean steamers, five trunk-lines of railways, seven lesser railways, and the Morris canal, greatly facilitates the transport of coal, iron, etc., and materially fosters its industries. Jersey City has iron-foundries, iron, steel, and zinc works, boiler yards, machine shops, railway plant manufactories, tobacco factories, breweries, and other establishments which turn out watches, glass, crucibles, sugar, soap, candles, and a large variety of hardware and other articles. The extensive abattoirs at Long Dock are noteworthy for their excellent management. The "City of Jersey" was incorporated in 1829; but in 1851 it received another charter, under its present name. Its very rapid growth has been largely owing to its absorption of the townships and cities of Van Voorst in 1851, Hudson and Bergen in 1870, and Greenville in 1872. The population in 1850 was 6856; in 1870, 82,546; and in 1880, 120,722, making it the seventeenth city in point of population in the United States.



Plan of Jersey City.

JERUSALEM.

JERUSALEM (Heb. יְרוּשָׁלַםִ, *Yerushalayim*, pronounced as a dual; but the old pronunciation seems to have been *Yerushalem*, whence, through the LXX., Ἰερουσαλήμ, we have the common English form). The meaning of the name is obscure, none of the current interpretations, "vision of peace," "abode of peace," and the like, being free from difficulty. A later abbreviated form is שָׁלֵם, Salem (Ps. lxxvi. 2),[1] whence Σόλυμα, Solyma. The ordinary Greek and Latin forms are Ἱεροσόλυμα, Hierosolyma. Hadrian changed the name of the city to Ælia Capitolina, and Ælia long continued the official name, and even passed over into Arabic in the form Îliyâ. The Arabs, however, commonly designate Jerusalem by epithets expressive of its sanctity, Beit el Maḳdis, El Muḳaddas, El Muḳaddis,[1] or, in the modern vernacular, more briefly El Ḳuds, "the sanctuary."

---

[1] Whether the narrator of Gen. xiv. 18 means Jerusalem by Salem, the city Melchizedek, is still disputed, and the decision of the question is embarrassed by the uncertainty attaching to the date of his narrative. If the chapter is early, Salem can hardly mean Jerusalem, but many critics now assign to it a very late date.

I. Natural Topography and Results of Excavations.

The history of Jerusalem exploration dates from the year 1833, when Bonomi, Catherwood, and Arundale succeeded in obtaining admission into the Haram (Harám) enclosure and made the first survey of its buildings. In 1838 and 1852 the city was visited by the famous American traveller Dr. Robinson, and his bold impeachment of the traditional topography, while raising a storm of controversy, laid the foundation of a truer understanding of the antiquities of Jerusalem. In 1849 Jerusalem was surveyed by Lieutenants Aldrich and Symonds of the Royal Engineers, and maps by Vandevelde, Thrupp, Barclay, and others were subsequently published. All these earlier attempts were, however, superseded in 1866 by the ordnance survey executed by Captain (now Colonel) Wilson, R.E., whose plans of the city and its environs, and of the Haram enclosure and other public buildings are the standard authorities on which all subsequent work has been based. During the years 1867–70 excavations of a most adventurous description were carried on by Captain (now Colonel) Warren, R.E. The results, especially in the vicinity of the Haram, were of primary importance, and many stoutly-contested theories have now succumbed to the testimony of the spade. During 1872–75 some further explorations were carried on by Lieutenant Conder, R.E., while for many years a most valuable series of observations of the levels of the rock beneath the rubbish on which the modern city stands has been carried out by Mr. C. Schick, architect.[2] The present account of the city is based on the results which have thus been obtained by actual exploration; but, although so much has been done during the last fifteen years to clear up disputed questions, much still remains to be accomplished.

The geographical situation of Jerusalem has now been determined by trigonometry to be 31° 46′ 45″ N. lat. and 35° 13′ 25″ E. long. of Greenwich (taken at the dome of the Holy Sepulchre church). The city stands at the extremity of a plateau which shelves down in a southeast direction from the watershed ridge of Judæa, which is here somewhat contorted. About a mile north of the town the ridge coming from the north is deflected towards the west at an elevation averaging 2600 feet above the Mediterranean, and thus passes clear of the city on its west side. From this ridge at the point of deflection an important spur with steep and rugged eastern slopes runs out southeast for 1½ miles, and thence southwards for 1¼ miles more. The spur culminates in two principal summits, the most northerly 2725 feet above the sea, the second (now crowned with a village and a minaret) 2650 feet above the same level; and there is a third summit or knoll on the south terminating the spur and rising to an elevation of 2410 feet. To this chain (but more especially to the central summit with the minaret on it, now called *Jebel et Tôr*) the name Olivet applies. The plateau between this chain and the watershed ridge is drained by two flat open valley heads, which form a junction about ½ mile north of the northeast angle of the modern city, and become a deep ravine with sides steep and in places precipitous, running immediately beneath and west of Olivet for a distance of 1½ miles from the junction to a well called *Bîr Eyûb*, where the bed is 1979 feet above the Mediterranean and 430 feet below the termination of the Olivet chain. This valley is the "brook" (*naḥal* or *fiumara*) Kidron, bounding the site of Jerusalem on the east. A second valley (W. er Rabâby) has its head in a shallow depression northwest of the city close to the watershed, whence it first runs south for about ½ mile, and then—rapidly deepening and flanked by low precipices—trends east for another ½ mile, joining the Kidron in an open plot close to the Bîr Eyûb above noticed. The second valley thus flanking Jerusalem on the west and south encloses an area half a mile wide and rudely quadrangular,—the seat of the city itself whether ancient or modern.

The site thus generally described—a natural fortress standing on spurs of hill surrounded on three sides by valleys 300 to 400 feet deep—is but imperfectly supplied with water. Only one spring exists anywhere near the city, namely, that in the Kidron valley, about 700 yards above the junction with the western ravine, now called the "spring with steps" (*Umm ed Derej*), or the "Virgin's spring." The vicinity of Jerusalem consists of strata of the Eocene and Chalk formations, having a general dip down from the watershed of about 10° E.S.E. The action of denudation has left patches of the various strata, but generally speaking the oldest are on the west. The upper part of the Olivet chain consists of a soft white limestone, with fossils and flint bands belonging to the Upper Chalk; beneath this are—first, a hard silicious chalk, with flint bands; secondly, a soft white limestone, much used in the ancient buildings of the city; thirdly, a hard chalk, often pink and white in color, and then known as Sta. Croce marble. The underlying beds belonging to the period of the Greensand are not visible, the lowest strata in the Kidron precipices belonging to the Lower Chalk epoch.

The actual position of the city at various times has differed but little in comparison with other capitals. The outline of the small spurs concerning which so many famous controversies have arisen is now much obscured by the accumulation of rubbish, which has been increasing ever since the time of Nehemiah (Neh. iv. 10). There is an average depth of from 30 to 40 feet of this debris throughout the town, and the foundations of the modern houses often stand upon it. In the valleys there is a depth of 70 feet, and east of the temple in one place shafts were sunk 120 feet before the rock was reached. The natural features of the ground, although unaltered and traceable to a practiced eye, are thus less sharply accentuated than in the ancient period of the city's history. As, however, we have now more than two hundred and fifty actual observations of the rock levels in an area of 210 acres, there is no difficulty in recovering the general features of the ancient natural site of the town.

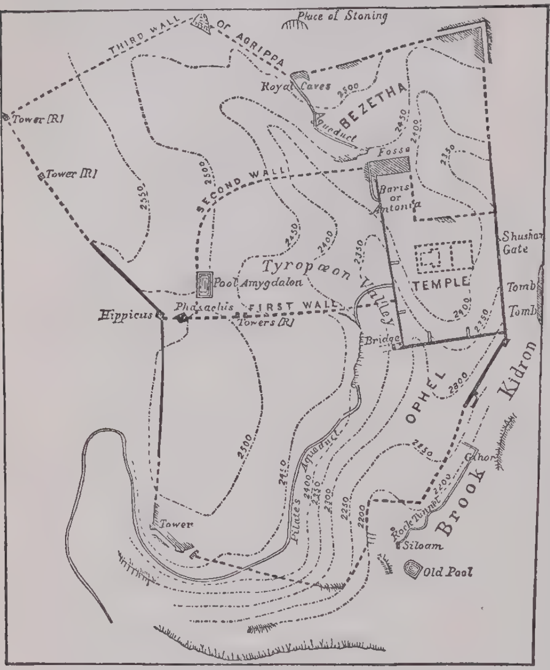
The quadrangle included between the two outer valleys above described is again split up by a valley, the Tyropœon of Josephus, which divides the plateau into two main spurs,—that on the east being the temple hill, that on the west the seat of the upper city. The Tyropœon is both shallower and broader than the boundary ravines already noticed, its depth averaging only from 100 to 150 feet below the crests of the ridges. Its real head is immediately outside the present Damascus gate and the north wall of the modern city, whence it runs with a curved course southwards to join the Kidron just above the junction with the western boundary valley, a distance of about 1600 yards. There is, however, a second affluent or head of the central valley on the west side of its main course—a kind of dell or theatre-shaped depression extending westwards for more than 300 yards, and measuring not quite 200 yards north and south. Thus, while the eastern ridge is unbroken, the western is divided into two summits joined by a narrow saddle which separates the head of the broad central valley just described from the upper part of the western boundary valley.

---

[1] See Yákút, iv. 590; *Táj el 'Arús*, iv. 214.

[2] See Zimmermann's *Karten und Pläne zur Top. d. alt. Jerus.*, based on Schick's measurements (Basel, 1876); *Quart. Stat. of P. E. F.*, 1880, p. 82.

Of the two western hill tops, that towards the south is the largest and most lofty. It has a trapezoid shape, and terminates on all sides in steep slopes, which are in places precipitous, and it is only joined to the watershed by the connecting saddle, which is scarcely 50 yards in width. This high southern hill measures 2000 feet north and south by about 1300 feet east and west. The highest part is towards the west, where the level of the flat broad summit is about 2520 feet above the Mediterranean. The smaller northern knoll or hill top, bounded on the east by the great central valley of Jerusalem, on the south by the theatre-shaped valley which separates it from the high southern hill, and on the west by a small subsidiary depression running north, rises to a summit not more than 2490 feet in elevation, or 30 feet below the flat top of the larger southern hill.



Contours of Ancient Jerusalem, with the line of the Walls, according to Lieut. Conder.

The eastern ridge, on which the temple stood, has a height towards the north of about 2500 feet; it then becomes narrower, and is artificially divided by a deep rock-cut trench running east and west. Its original form within the temple enclosure was that of a rounded top with a steep western slope and a more gentle gradient on the east, the level of the ridge falling from 2460 to 2300 feet in a length of about 500 yards. The end of this ridge is formed by a tongue of ground between the Kidron and the shallow central valley, falling rapidly in 400 yards to a level only 50 feet above the valley beds.

The identity of the present Haram (or sanctuary) with the ancient temple enclosure is undisputed, the only question which has arisen being whether the boundary walls now existing coincide with the outer ramparts of Herod's temple enclosure. The Haram is a quadrangle containing 35 acres, the interior surface roughly levelled, partly by filling up with earth the portions where the rock is lowest, partly by means of vaulted substructures of various ages. The most important results of Captain Warren's excavations were those connected with the exploration of the rampart walls, which measure 1601 feet on the west, 922 on south, 1530 on east, and 1042 feet on north, the southwest angle being 90° and the southeast 92° 30′. The height of the wall varies from 30 to 170 feet. On the west, on the south, and on the east for probably 1090 feet from the southeast corner, the masonry is all of one style, the stones being of great size with a marginal draft,—the imperfect finish of the faces in some of the lower courses apparently showing that the foundation-stones were never visible above the surface. The north part of the east wall consists, however, of masonry differing somewhat from the rest, the finish being rougher and the stone of inferior quality. It was found that this wall is continued for some distance beyond the northeast corner of the present area. The present north wall is of quite a different kind of masonry, and appears to be much more recent, the substructures immediately inside being only as old as the 12th century. The northwest angle is formed by a projecting scarped block of rock measuring 350 feet east and west and 50 feet north and south, the height above the interior court being about 30 feet. On this scarp the modern barracks stand, and a fosse 60 feet deep and 165 feet wide is still traceable outside the rock on the north. A valley bed 100 feet below the level of the Haram court ran across the northeast portion of the area into the Kidron; and south of this the remains of a scarp running east and west have been discovered, but are not as yet completely explored. The prolongation of this scarp eastwards cuts the east wall of the Haram at the point 1090 feet from the south angle, at which the change in the character of the masonry above explained probably occurs. The evidence thus obtained seems to indicate that an area of about 7½ acres has been added to the ancient enclosure on the northeast to give it the present quadrangular form, and the rougher masonry on the east appears to have belonged to the city wall constructed by Agrippa and not to the older wall of Herod's temple.

At the southwest angle of the Haram enclosure are the remains of an ancient arch (Robinson's arch), 42 feet span, belonging to a bridge across the Tyropœon, the west pier of which Captain Warren discovered, as well as the fallen voussoirs, lying on a pavement 40 feet beneath the surface, while under the pavement 20 feet lower was found the voussoir of a former bridge on the same site (*cf.* Jos., *B. J.*, i. 7, 2). At the southeast angle of the enclosure Captain Warren found beneath the surface remains of an ancient wall of finely drafted masonry abutting on the east rampart of the Haram, and here some unexplained marks or letters in red paint were discovered on the lower stones. The buried wall runs southward for 250 yards at a height of 70 feet, and is held to be part of the wall of Ophel. The base of a great projecting tower was also laid bare, and identified by the discoverer with the tower of Neh. iii. 25. Another noticeable discovery was the fact that an ancient aqueduct is intersected by the west Haram wall, which must consequently be more recent than the rock tunnel thus destroyed.

The facts thus ascertained allow of the identification of the great walls still standing with those which supported the outer cloisters of the temple enclosure in the time of Herod's reconstruction of the edifice. The original area of Solomon's temple enclosure was doubled by Herod (*B. J.*, i. 21, 1), who took away the ancient foundations and made a quadrangle extending from the fortress of Antonia to the royal cloister, to which a great bridge led from the upper city (*B. J.*, vi. 6, 2), while the eastern limit was formed by the Kidron ravine, the Ophel wall joining the plateau of the temple at the southeast angle (*Ant.*, xv. 11, 5; *B. J.*, v. 4, 2).

The scarped rock at the northwest angle of the Haram, with its outer fosse dividing the temple hill from Bezetha, answers exactly to the description by Josephus of the tower of Antonia (*B. J.*, v. 5, 8), and thus serves to identify the northwest angle of the ancient enclosure with the corresponding angle of the modern Haram. The correspondence of the southwest angles of the two areas is established by the discovery of the great bridge, and that of the southeast angles of the same by the exploration of the Ophel wall. The northern boundary of Herod's temple probably coincided with the scarp already described, 1090 feet north of the southeast angle. The area was thus, roughly speaking, a quadrangle of 1000 feet side, from which the citadel of Antonia, as described by Josephus, projected on the northwest (*cf. B. J.*, vi. 5, 4).

The natural water-supply of Jerusalem is from the Virgin's spring already noticed, which comes out from beneath the Ophel ridge in a rocky cave extending 12 feet from the face of the hill, and reached by flights of twenty-eight steps. The water flows with an intermittent action, rising from beneath the lowest steps, at intervals, varying, according to the season and the rainfall, from a few hours to one or even two days.

From this spring a rock-cut tunnel 1708 feet in length leads through the Ophel ridge to the Pool of Siloam (now *Birket Silwán*), which is a rock-cut reservoir with masonry retaining-walls measuring 52 feet by 18 feet, having a rock-cut channel leading away from it to a larger pool formed by damming up the flat valley bed with a thick wall of masonry close to the junction of the Kidron and the Tyropœon.[1] A rock-cut shaft—like the great tunnel a work of immense labor—leads from the spring westwards to an entrance from the surface of the ground 120 feet above and 180 feet west of the spring. The rock tunnel was known in the 17th century, but the shaft which formed a secret entrance to the one spring of Jerusalem was discovered by Captain Warren. The water of Siloam was originally sweet, but has been fouled and made bitter since the 12th century. From the reservoir it runs southwards to the *Bîr Eyûb* already noticed, a well 125 feet deep.

The remaining reservoirs of Jerusalem are fed by aqueducts and by the rains. West of the city is the rock-cut Mamilla pool. In the upper part of the valley of Hinnom is *Birket es Sultán*, constructed in the 12th century. Since the 14th century these two tanks have been erroneously named the Upper and Lower pools of Gihon. Inside the city is the Patriarch's Pool near the west (the ancient Amygdalon or "Tower Pool," *B. J.*, v. 11, 4), while immediately north of the Haram are the Twin Pools made by roofing in part of the ancient fosse, and the *Birket Isráíl*, measuring 360 by 130 feet, and apparently constructed after the great destruction of 70 A.D.

The Twin Pools were identified in the 4th century with Bethesda, but since the 12th that name has been given to the Birket Isráíl. The site of Bethesda is still doubtful.

Three aqueducts supplied the city, one of which, constructed by Pilate (*Ant.*, xviii. 3, 2), led from the so-called pools of Solomon, 7 miles distant, to the temple, and still conveys water when in repair. Its course appears on the map; the second from the same locality probably fed the Birket Mamilla, but is now lost; the third from the north collected surface drainage and led to the temple enclosure underground, a distance of 2000 feet only. The great reservoirs in this enclosure, about thirty in number, were capable of holding a total supply of 10 million gallons of water.

(C. R. C.)

II. Ancient Jerusalem.

Up to the time of David the strong fortress of Jerusalem remained in the hands of the ancient Canaanite inhabitants who were known as Jebusites.[2]

The city was deemed impregnable, but its conquest was one of the first exploits of David, when he became king of all Israel, and had need of a capital that should serve as a base for his military operations and a centre of union for Judah and Israel. Lying on the frontier line between his own tribe of Judah and the difficult country of Benjamin, which had been the centre of the struggle with the Philistines since the fall of Shiloh, Jerusalem was admirably adapted for these purposes. The Jebusites were not expelled, but continued to live side by side with the Hebrews (Josh. xv. 63; Judg. i. 21; 2 Sam. xxiv. 18; Zech. ix. 7). David himself occupied "the mountain fortress (מְצָדָה) of Zion," which was strengthened by new walls and received the name of the city of David. Here a palace was built by Tyrian architects, and the new capital was consecrated by the removal to it of the ark.

The site of the city of David forms the fundamental question of Jerusalem topography. The current traditional view (but not that of the most ancient tradition even in the Christian church) makes Zion the southern eminence of the western hill, and places David's fortress there. More recently Messrs. Warren and Conder have contended that the city of David is identical with the Acra of Josephus, and place the latter on the northern summit of the western hill, between the two branches of the Tyropœon (see below). A third view places the city of David on the southern part of the Temple hill; and this opinion is not only conformed to the oldest post-Biblical tradition (1 Maccabees, Jerome, etc.), in which Zion certainly means the Temple hill, but is the only view that does justice to the language of the Old Testament.

It is necessary at the outset to clear away the popular idea that the capital of David was already a great town, occupying a site comparable in extent with that of the later city. Certainly if all the Levites and sacred ministers mentioned in Chronicles were actually assembled at Zion in David's time, we might conclude that the town was already a capital on a grand scale. But the Chronicler constantly carries back later institutions into primitive times, and the early history, which alone can be viewed as a safe guide, gives quite another picture. Zion was merely one of the "mountain fortresses" found all over Palestine as places of refuge in time of invasion, and was garrisoned by a handful of mercenaries (the *Gibbôrîm*). The whole levy of Israel in David's time was but 30,000 men (2 Sam. vi. 1; comp. the 40,000 of Judg. v. 8), and before the development of trade among the Hebrews Jerusalem had not the natural conditions for the growth of a great city. In the first instance the town doubtless consisted mainly of the court and its dependants, with the Jebusite population, who must have been predominantly agricultural and limited in number by the limitation of their territory. Now it is quite incredible that the Temple hill was ever excluded from Zion. Throughout the Old Testament Zion appears as the holy mountain, the seat of the sanctuary. It is true at the same time that Zion and the site of Jerusalem are interchangeable ideas in Hebrew literature; but this only proves that the mountain of the sanctuary was essentially the mountain on which the city stood.[3] Further, it is clear from 1 Kings, viii. 1 *sq.*, 2 Sam. xxiv. 18, that the temple stood above the city of David, as elsewhere in Hebrew holy places the sanctuary crowned the hill on whose slopes the town stood. Moreover, the graves of the kings, which were certainly in the city of David, encroached on the temple enclosure (Ezek. xliii. 7, 8), which indeed at the time of the captivity was closely built up (*ibid.*), and stood in the middle of the city (Ezek. xi. 23). Again, Micah iv. 8, identifies the ancient "tower of the flock," the original seat of the kingdom at Jerusalem, with "Ophel of the daughter of Zion." But Ophel is one of the few topographical names that can be traced down to the time of Josephus, whose description shows that it lay to the southeast of the temple. Still more precise is the determination given by references to the one fountain of Jerusalem, which, as we have seen, springs out under the temple hill on the east. According to Neh. iii. 15, xii. 37, the city of David was reached by a stair in the vicinity of the fountain gate and the pool of Siloah.[1] This ascent led up above David's palace to the water gate, where in Nehemiah's time there was an open space in front of the temple (comp. Neh. viii. 1, 16, with Ezra x. 9). Thus we see that David's palace lay between the temple and the pool of Siloah or King's pool (Neh. ii. 14). These notices are the more important because the water system connected with the Virgin's spring forms almost the only quite certain part of Jerusalem's topography. The spring itself is Gihon, which from its name must have been a true spring, while 2 Chron. xxxiii. 14, teaches us to look for it in the Kidron valley (נחל). The subterranean conduit which still exists had for its object to conduct the water inside the city, and appears to be that constructed by Hezekiah (2 Kings xx. 20). In Isa. xxii. 8, 11, we read of a lower pool and an old pool (no doubt identical with the upper pool, Isa. vii. 3; 2 Kings, xviii. 17), whose waters were collected in the time of Hezekiah, under apprehension of siege, in a reservoir between the two walls. From this passage, compared with Neh. iii. 15, we gather that Hezekiah's pool was protected by an outer line of fortification, and here lay the gate of the two walls (2 Kings, xxv. 4), with the royal gardens beside them. The supplementary notices of the conduit and the outer wall, given in Chronicles, have not the weight of contemporary history, but they show the writer to have still possessed the same tradition as to the place of the city of David, for he describes its outer wall as running along the Kidron valley west of Gihon (*i. e.*, so as to leave the fountain outside, 2 Chron. xxxiii. 14; comp. xxxii. 3, 4), and tells us that Hezekiah's conduit brought the water of Gihon in a westerly direction to the city of David (chap. xxxii. 30).

---

[1] A very ancient Hebrew inscription, referring to the construction of the tunnel, was discovered in June, 1880. The date and many points in the reading and interpretation are still obscure.

[2] In Judg. xix. 10, 1 Chron. xi. 4, the city itself is called Jebus; but as this part of the Book of Judges (as well as Josh. xv. 8, xviii. 28) is probably of late date, and the older records use the name Jerusalem, it is not safe to regard Jebus as the earliest name of the city. The reference to Jerusalem in Judg. i. 7 seems to be an interpolation, and Josh. xv. 63, Judg. i. 21 to refer to the time after David.

[3] The explanatory note of an editor in 1 Kings, viii. 1, "the city of David, which is Zion," cannot be strained to mean that the removal of the ark from the city of David to the temple was its removal from the mountain of Zion to another hill.

According to the Bible, then, the city of David lay on the southern part of the hill which his son crowned with the temple.[2] The chief feature in the fortifications was a tower named Millo, perhaps on the site of the modern barracks, protecting the approach to Zion from the north. The town had but little splendor. The king occupied a wooden palace, the work of foreign craftsmen, and the ark still dwelt in curtains. Under Solomon, who had the true Oriental passion for building and luxury, and squandered enormous sums on his court, great improvements were made, especially by the erection of the twin palaces "the house of Jehovah and the house of the king," constructed of stonework strengthened by string courses of wooden beams in the still familiar style of Arabian building. The palace, which took nearly twice as long to erect as the temple, consisted of a great complex of buildings and porticoes, including the porch of judgment, an armory, and the palace of the queen.

The site of the palace has been variously assigned by topographers. But it lay above the old residence of David[3] (1 Kings, ix. 24), and all the indications given in the Old Testament lead us to place it quite close to the temple, with which its porticos seem to have been connected (2 Kings, xvi. 18; xxiii. 11). Wellhausen indeed, from an examination of 1 Kings, vi., vii., has made it probable that the royal buildings lay within the outer court of the temple (Well.-Bleek, *Einl.*, p. 232). The clearest details are connected with a court of the palace called the prison court (Jer. xxxii. 2), where there was a gate called the prison gate, and a great projecting tower (Neh. iii. 25–27). This part of the building must have been close to the temple, for it was at the prison gate that the second choir in the procession of Neh. xii. halted and stood "in the house of God," meeting the other choir, which ascended from Siloah by the stair above David's house and reached the temple at the water gate. It appears further from Neh. iii. 27 that the fortifications of the prison were adjacent to Ophel, so that the palace seems to have stood about the southeast corner of the temple area.[4]

After the division of the kingdoms Jerusalem was shorn of its political glory. The city itself was taken by Shishak in the reign of Rehoboam, and lost the riches accumulated by Solomon. The great houses of Omri and Jehu quite overshadowed the kingdom of Judah, which forgot its weakness in the reign of Amaziah only to receive signal chastisement from Jehoash, who took Jerusalem, and partly levelled the walls (2 Kings xiv.). The decline and fall of Samaria raised the relative importance of the southern capital; the writings of the prophets show that wealth had accumulated and luxury increased, and so we find King Jotham adding an upper gate in the northern or higher court of the temple (2 Kings xv. 35; Jer. xxxvi. 10; Ezek. ix. 2), while Hezekiah, as we have already seen, labored for the improvement of the water supply, and so rendered the city more capable to resist siege. The later history in Chronicles adds details of fortifications erected by Uzziah and Manasseh, which probably express the oral tradition current in the author's day. In the later days of the monarchy Jerusalem had so far increased that we read of a second town or quarter (2 Kings xxii. 14; Zeph. i. 10, Heb.; comp. Neh. iii. 9). There was also a trading quarter called the Maktesh, inhabited by Canaanites or Tyrians (Zeph. i. 11), who still formed a large part of the mercantile population after the exile (Neh. xiii.; Zech. xiv. 21). Maktesh means *mortar*, so that we must suppose the traders to have lived in a hollow valley, perhaps the upper part of the Tyropœon. But the main part of the town was still grouped round the temple plateau, from which steep streets ran down the slope of the hill (Lam. iv. 1), the houses rising tier above tier, so that the roof tops commanded a view of the environs (Isa. xxii.). According to Eastern custom the handicrafts—*e.g.*, the bakers, Jer. xxxvii. 21—had their own streets or bazaars.

For the compass of the walls of Jerusalem at the time of its capture by Nebuchadnezzar the chief document is the account of the restoration of the fortifications by Nehemiah, who followed the old line, and speaks of the various gates and towers by their old names. His description presents many difficulties, the most intelligible part being that which deals with the eastern wall, from Siloah and the fountain gate to the point where the temple and the palace joined one another. The western boundary of the city is particularly obscure, and its position must be mainly determined by reference to the "valley gate" (Neh. ii. 13; iii. 13). The valley (*gay*) is used as a proper name, and is no doubt identical with the valley (*gay*) of the son of Hinnom, the Kidron valley being always called

---

[1] The fountain gate is the gate beside Siloah, which is itself called the fountain (πηγή) by Josephus (*B. J.*, v. 4, 1).

[2] The statements of Josephus as to the topography of the city of David and Solomon are of no independent value. He possessed no sources except the Old Testament.

[3] So in Neh. iii. 25, it is called the upper palace in distinction from the house of David, chap. xii. 37.

[4] Another view is that Solomon's palace stood on the western hill, and was connected with the temple by a bridge. But "the ascent" of the A. V. of 1 Kings, x. 5, does not exist in the original, and seems to rest on a false reading in Chronicles. In Ezek xliv. the sovereign enters the temple from the east.

naḥal, i.e., fiumara. The common opinion makes this *gay* the valley to the west of modern Jerusalem (Wâdy er Rabâby), in which case the valley gate must necessarily have occupied much the same position as the modern Jaffa gate, and the whole of the later upper city on the southwest hill must already have been included within the walls. This view, however, is far from indisputable. A thousand cubits south of the valley gate was the dung gate, the gate before which the rubbish heaps of the city lay. This on the common theory must have been about the southwest corner of the hill, near the present Protestant school. Between this point and the fountain gate in the vicinity of the pool of Siloah is nearly half a mile in a straight line, and the intervening wall must have been much longer if it followed the natural line of defence. Yet Nehemiah gives no account of this section of the ramparts (Neh. iii. 14, 15). His record seems to imply that the fountain gate was near the dung gate; and similarly in chap. xii. the procession which went southward to the dung gate is immediately afterwards found at the fountain gate. It is hardly possible that so important a part of the circuit should be twice omitted, and in fact the vast lacuna disappears at once if we suppose that the *gay* is the Tyropœon, and that the upper city of Josephus on the southwest hill was not enclosed in the circuit of Nehemiah's walls. In that case the valley gate lay on the Tyropœon, somewhere near the southeast angle of the Haram area, and the wall ran southward along the east side of the valley, till at the pool of Siloah an outwork was thrown out to protect the water supply.

Besides simplifying the topographical difficulties of Neh. iii., this view has several other advantages. On the received view the Tyropœon is nowhere mentioned in Scripture, though it lay in the heart of the city. This difficulty is removed by the view above suggested, and the third valley (W. er Rabâby) appears to be quite out of relation to the circuit of the Biblical Jerusalem, so that one does not look for much mention of it. Again, we have seen that the Canaanite quarter of the city lay in a hollow—presumably in the Tyropœon, and it is very natural that the seat of Canaanite worship in the valley of Hinnom should be in the vicinity of this quarter. Once more, by placing the valley gate quite near the temple, we understand how it was in this neighborhood that the sacred procession in Neh. xii. began its course. Even at a much later date the Temple hill was the real stronghold of Jerusalem, which Judas and his successors were concerned to fortify with walls. It would have been folly in Nehemiah to enclose a much vaster and less defensible circuit when the inhabitants were so few that it was necessary to draft one-tenth of the whole people into the capital (Neh. xi. 1).

The course of the wall north of the valley gate must still have skirted the base of the Temple hill east of the Tyropœon. It is not improbable that the Maktesh or Canaanite trading quarter lay outside the fortifications, a bazaar beyond the gate being a common feature in Eastern towns.[1] From the tower of furnaces or ovens the "broad wall" ran to the point where in the Persian time the governor of the Syrian provinces had his throne. The throne would stand in an open place by a gateway, and comparison of Neh. iii. 7 with xii. 39 shows that the gate must have been that of Ephraim, *i. e.*, the gate of the main road leading to the north, which then as now must almost of necessity have followed the upper course of the Tyropœon, and so would skirt the walls for some distance before entering the city. In fact there were 400 cubits between the gate of Ephraim and the corner gate (2 Kings xiv. 13). The corner gate is also named the first gate (Zech. xiv. 10), and so is probably identical with the old gate of Nehemiah. For obvious engineering reasons the eminence at the northwest of the Haram area must always have been a principal point in the fortifications, and here the old gate may very well be placed. It is indeed very likely that this was the site of the ancient bastion of Millo. From the corner gate the north line of the wall ran by the fish gate to the towers of Meah and Hananeel, the latter of which appears in Zech., *loc. cit.*, as the opposite extremity of the city from the royal wine vats in the gardens by Siloah, while in Jer. xxxi. 38 the line between it and the corner gate is named as the natural direction of extension for the city. The tower, therefore, must have stood very near the northeast corner of the wall, but not so far east as the angle of the Haram area, which is here built out, disguising the natural line of the hill side. From Zech., *loc. cit.*, we see that the Benjamin gate was at the east end of the north wall. There was a road into Benjamite territory over the Kidron (1 Kings ii. 37), and to this there was a natural descent by a small valley now nearly obliterated, having its head a little south of the Birket Isráíl. Here too is the direct way to Anathoth, which was through the Benjamin gate (Jer. xxxvii. 13). In Nehemiah's record the sheep gate seems to have the same position. From the angle near the tower of Hananeel and the Benjamin gate the line of the hill run southwards, trending to the east. At the extreme east point, beyond the present line of wall, and a little south of the modern golden gate, must be placed the horse gate (Jer. xxxi. 40). South of this again came the fortifications of Ophel and the upper palace, and from this point the enceinte swept round to the pool of Siloah. The lower wall of Manasseh in 2 Chron. xxxiii. 14 is described as an outwork in the Kidron valley extending all along the eastern side of the town and round the northeast corner.

The long blank in the history of the Jews which follows the time of Nehemiah makes it impossible to trace the progress of Jerusalem in any detail. Under the Persian empire the Jews enjoyed little prosperity. Alexander spared the city, but in 320 its walls were rased by Ptolemy I. (Appian, *Syr.*, 50). A period of comparative prosperity followed, culminating in the high priesthood of Simon II. (219–199 B.C.), who repaired the temple and strengthened its defences and fortified the city. The walls were again destroyed and the city burned by the army of Antiochus Epiphanes in 168 B.C. When Judas Maccabæus reconsecrated the temple (165) he also fortified the holy mountain of Zion (the Temple hill) with wall and towers. Once more rased by the Greeks, the walls of the city were renewed with hewn stone by Jonathan.

It is plain from 1 Macc. iv. 60, vi. 7, x. 11, that up to this time the fortified city was still identical with the Temple hill; but a new topographical problem is raised by what is related of the citadel (Akra) erected by Epiphanes to dominate the town. The Akra is identified by the author with the city of David. It continued to be held by the Greeks after the town was fortified by the Maccabees, and indeed was ultimately reduced by the erection of a special wall cutting off the Greek garrison from access to the city and market (xii. 36). The natural inference from all this is that the Greek citadel lay on the Temple hill, and presumably on the site of the later Antonia. That hill is certainly the Zion of 1 Macc.; and the city of David, with which the Akra is identified, had always meant the fortress of Zion. The same result seems to follow from the language of Josephus. When Josephus lived Jerusalem was almost a new town. Under the Maccabees, and again under Herod, the prosperity of the Jews was greater than at any previous time. The sanctuary was a centre of pilgrimage from the most distant lands, and the sovereigns of Jerusalem had an empire greater than any of the kings after Solomon. The growth of the city must have been enormous, and the great buildings of Herod and his successors had wholly changed its aspect, especially in the quarter of the temple and on the western hill where the royal palace stood. These changes were very apt to mislead an uncritical writer with regard to the ancient topography, and in fact Josephus falls into a radical blunder by assuming that the fortress of David belonged to the upper city, like the royal castle of his own day,[2] and that the western hill had always been part of Jerusalem. But of Jerusalem as he himself saw it he gives a vivid description (*B. J.*, v. 4, 1). The city stood on two hills divided by the Tyropœon valley, into which the houses descended tier beneath tier. The higher western hill was called the upper market, the lower hill across the Tyropœon was the citadel hill, and was called indifferently the Akra or the lower city. That this Akra included the ridge south of the temple is clear from several marks: the hill was ἀμφίκυρτος, "hog-backed;" it was cut off by ravines on the outer side, and had a continuous approach to the temple, which stood on the higher ground; finally, it extended to Siloah at the mouth of the

---

[1] In fact at the siege of Titus the wool and clothes market and the brassworkers' bazaar still lay much in the same quarter, in the new city, outside the old line of fortification, though within the second wall (*B. J.* v. 8, 1.)

[2] A perpetuation of this blunder gives the current name Tower of David to the Herodian tower, probably Phasael, which still stands by the Jaffa gate. On this tower compare a paper by Schick in *Zeitschr. d. Deut. Palästina-Vereins*, vol. i.

Tyropœon.[1] Thus we see that, though Josephus himself has lost the true tradition as to the city of David, he furnishes additional proof that the citadel hill, still identified with it by the author of 1 Macc., was no other than the eastern hill.

A different view of the Akra was maintained by Robinson, and has been elaborated by Messrs. Warren and Conder[2] in connection with recent better observations as to the two heads of the Tyropœon valley. It is maintained that the Akra was a knoll, west of the Temple hill and north of the traditional Zion, between the two heads of the Tyropœon. To gain any show of plausibility for this view it is necessary to lay great weight on a statement of Josephus that the Temple hill was once a third eminence lower than the Akra, and divided from it by a broad ravine, and that Simon after taking the Akra destroyed the citadel and labored for three years to reduce its site below the level of the temple plateau and fill up the intervening hollow (*B. J.*, v. 4; *Ant.*, xiii. 6, 6). This story is probably exaggerated, for according to the early and trustworthy evidence of 1 Macc. xiii. the Akra was not destroyed, but only purged, and strengthened by additional fortifications on the sacred mountain. And in any case we know that the Akra was opposite the temple, and that in the time of Josephus there was no longer a ravine between, whereas the city opposite the temple to the west was still cut off by the deep Tyropœon (*Ant.*, xv. 11, 5), except where a bridge led to the palace on the western hill. Nor is it possible that the western head of the Tyropœon can be the deep ravine which, according to Josephus, separated the upper and lower city, for that head is the theatre-shaped basin described in *Ant.*, xv. 11, 5, as facing the temple across the ravine.

Under the Hasmonean dynasty we meet with the first unambiguous evidence that the city had extended to the loftier western hill, where a new palace was erected overlooking the temple (*Ant.*, xx. 8, 11). This continued to be the royal quarter, and was raised to great splendor by Herod, who covered a vast extent of ground with his palace, its courts and pleasure grounds. The palace of Herod embraced two edifices transcending the temple in magnificence, and the three enormous adjoining towers, Hippicus, Phasael, and Mariamne, made the upper city the strongest part of Jerusalem. Here also in Herod's days stood the xystus or gymnasium, beneath the Hasmonean palace, where a bridge spanned the Tyropœon. The bridge already existed under the later Hasmoneans, when the new quarter had as yet minor importance and the Temple hill was still the only citadel. Here the warlike high priest Hyrcanus usually dwelt in the castle (Βᾶρις, בירה) which Herod afterwards converted into the fortress of Antonia in the northwest corner of the enceinte of the temple (*Ant.*, xv. 11, 4; *B. J.*, v. 5, 8). Antonia had the form of a square keep, with loftier towers rising pinnacle-like at the corners. It commanded the temple and therefore the whole lower city, and by its two staircases the Roman soldiers descended into the porticoes of the temple to keep order among the worshippers (comp. Acts xxi. 35).

When Pompey besieged the Temple hill in 65 B.C., the bridge was broken down, and the Tyropœon afforded a complete defence on the west. His assault was made from the north, where there was a strong wall with towers and a deep fosse which was with difficulty filled up to permit the advance of his siege train. This fosse must be identified with the rock-cut trench north of the Haram area, and from Josephus's description seems to have been still the northern limit of the town. The walls destroyed by Pompey were restored by Antipater, and ten years later yielded, after an obstinate resistance, to Herod and the Romans (37 B.C.). The Baris, occupied by Antigonus, was not surrendered till the temple and the rest of the city had been carried by storm, and we now read of two walls which had to be reduced successively.

The most important buildings erected by Herod have already been alluded to, and his reconstruction of the temple will be considered under that heading. But the walls of the city as they existed at the time of the siege by Titus must still be described. They were three in number. The first wall consisted of a rampart to the north of Herod's palace, connecting Hippicus in the citadel of the upper city with the western porch of the temple, and of another line skirting the face of the western hill from Hippicus southward, thence curving round beyond Siloah, and joining the eastern wall of the temple enclosure at Ophel. Several traces of this wall still exist. The second wall, connecting a point in the northern line of the first wall with Antonia, enclosed the new town or trading quarter. Outside both these walls, on the hill side sloping southwards towards the temple, a suburb called Bezetha had grown up, which Agrippa I. in the time of Claudius Cæsar began to protect with a third wall conceived on a gigantic scale, but never altogether finished. The precise compass of this wall, which began at Hippicus and rejoined the first wall in the Kidron valley, has been much disputed—the great tower of Psephinus, which stood on very high ground, and formed its northwest angle, being supposed by some to have stood near the modern castle of Goliath (Kaṣr Jálúd), while others place it as far north as the Russian cathedral. The measurements by which it has been proposed to decide the northern limits of Jerusalem are the distance of 3 stadia from the city to the tomb of Queen Helena of Adiabene (commonly identified with the Tombs of the Kings, *Kubûr es Salâtîn*), and the circuit of 33 stadia assigned by Josephus to the whole city. These measurements would seem to imply that the ancient city stretched further north than the modern walls, but they can hardly claim to be taken as mathematically accurate; the estimates of the compass of the city vary, and Eusebius places it at 27 stadia. This again would imply a line closely coincident with the north wall of the modern town, agreeing with the remains of ancient scarping still visible, and with the express statement of Josephus that the line of the third wall passed through the royal caves, *i. e.*, the catacombs, or the cotton grotto and grotto of Jeremiah, which are separated by a kind of fosse cut through the live rock, and manifestly forming part of the old wall line.[3] In the siege under Titus the Romans successively carried the third and second walls. They then occupied Antonia, which was levelled to facilitate the approach of the forces for the attack on the temple stronghold. The temple was opened by fire rather than force, and, the Jewish leaders having retired to the upper city, the lower town from the temple to Siloah was burned by the Romans. The capture of the upper city was effected by a regular approach with mounds and battering rams (September 70 A. D.), and even then the huge citadel of Herod could only have yielded to famine had it not been abandoned by the Jewish leaders in a vain attempt at escape. Its three great towers, with a portion of the western wall, were left as a memorial, and of this group the so-called tower of David (Phasael) still stands.

The rebuilding of Jerusalem by Hadrian seems to have been originally conceived in a spirit friendly to the Jews, and there is even some evidence that the restoration of the temple was contemplated or commenced. After the great revolt, however, Ælia Capitolina was transformed into a purely pagan town with seven quarters and many buildings of heathen fashion.[4] The spread of Christianity and the rise of the practice of pilgrimage gave a new importance to the city of the crucifixion and resurrection, and in the time of Constantine the discovery of the Holy Sepulchre and the erection of the magnificent church of the Anastasis (dedicated 336 A. D.) again made Jerusalem a great religious centre. In the pagan reaction under Julian an attempt was made to rebuild the temple, but was

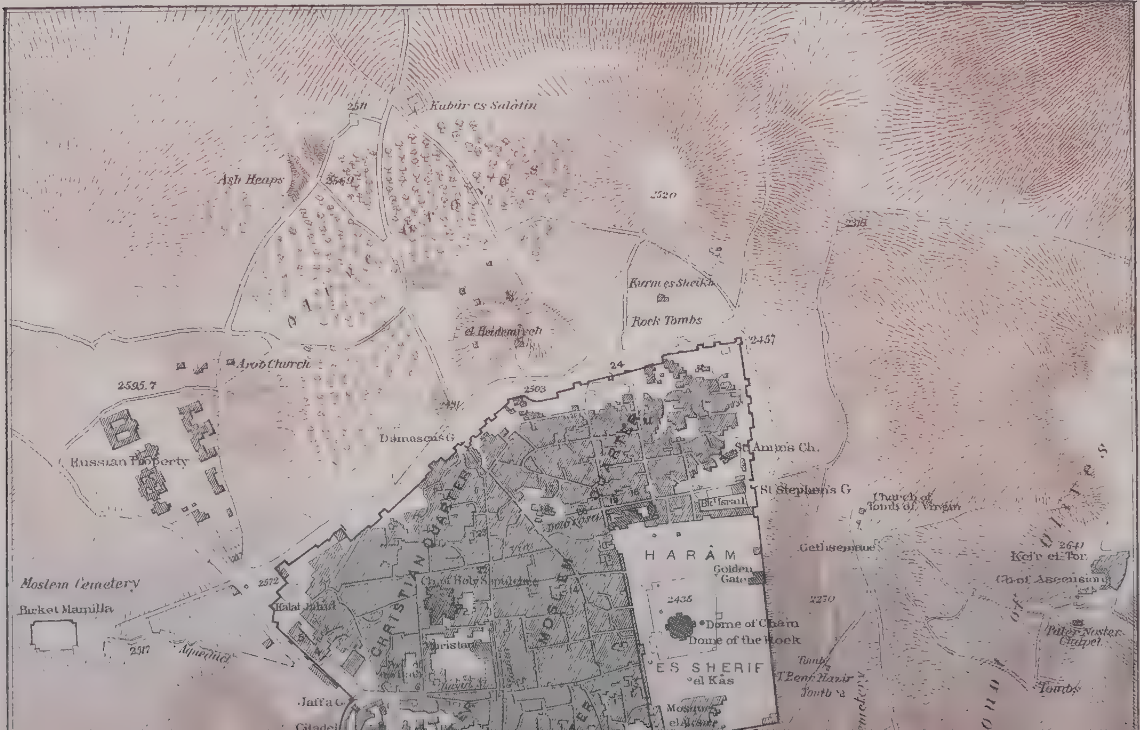
JERUSALEM.

PLATE X.



frustrated by an outburst of fire from the foundations (362). The unfortunate empress Eudocia spent her last years at Jerusalem (*c.* 350–360), repaired the walls, built the church of St. Stephen, founded monasteries and hospitals, and enriched the churches. The next great builder was Justinian, part of whose splendid church of St. Mary perhaps still remains in or to the east of the mosque El-Aḳsa. In 614 Jerusalem was taken by Chosroes, and the churches and sepulchre were burned, but the patriarch Modestus restored them as soon as the Persians retired. In 637 Jerusalem capitulated to the caliph Omar, who gave directions for the erection of a place of worship on the site of the "remotest shrine," *i. e.*, the temple, to which Mahomet, according to Kor. xvii. 1, was transported from Mecca in his famous night journey. From this verse the great sanctuary of Jerusalem received the name El-Aksa, now generally confined to the building at the south end of the Haram. The original mosque as described by Arculphus (670) was a rude edifice of wood capable of containing 3000 worshippers; but soon after the sanctuary was reconstructed in a style of great magnificence by the caliph 'Abd el Malik, whose date (72 A. H. = 691 A. D.) is still read on a Cufic inscription on the Dome of the Rock, though the name of the caliph seems to have been changed to that of El-Mamún, who restored the buildings after a great earthquake, which, according to Mokaddasy left nothing standing except the part around the *miḥráb* or niche indicating the direction of Mecca. In their present condition the buildings of the sanctuary show features of very various styles from the Byzantine downwards. The architectural problems which they suggest are closely connected with controversies as to the topography of the temple and the true site of the Holy Sepulchre, both of which subjects will be more conveniently discussed under Temple. Apart from the question of the holy sites, the later topography of Jerusalem presents no feature that need detain us, and the subsequent fortunes of the city belong to the general history of Palestine and the crusades.

(W. R. S.)

III. Modern Jerusalem.

Plate X. It appears probable that the crusading wall ran just outside the present one on the northwest side of the town—the remains of mediæval masonry existing all along this line. In 1192 Saladin fortified the same quarter with a second wall and a fosse, and, as remains of an interior wall are still traceable at the ruined tower called *Ḳal'at Jálúd*, it appears that the two ramparts must have run about 60 yards apart on this side of the town. Dismantled in 1219 and restored again in 1229, the fortifications were again destroyed in 1239, and the present walls were built in 1542 by Suleimán the Magnificent, as witnessed by inscriptions over the present Jaffa and other gates. The following is a conspectus of the gates at different times in consecutive order. :—

Modern Name.	Twelfth Century.	Fourth to Eighth Centuries.	Position.
1. St. Stephen's Gate, *Bâb Sitti Maryam*	Gate of Valley of Jehosaphat,	Gate of Valley of Jehosaphat,	E. wall.
2. Herod's Gate, *Bâb ez Zahrah*....	Postern of the Magdalen,	Gate of Benjamin,	N. "
3. Damascus Gate, *Bâb el 'Amûd*......	St. Stephen's Gate,	Gate of Galilee, Gate of Neapolis,	N. "
4.	Postern of St. Lazarus, *Bâb es Serb*	Gate of Fuller's Field, Gate of Judgment,	N. "
5. Jaffa Gate, *Bâb el Khalîl*......	Gate of David,	Gate of David,	W. "
6. Sion Gate, *Bâb Neby Dâûd*..	Sion Gate.........	Sion Gate......	S. "
7. Dung Gate, *Bâb el Maghâribeh*	Postern of Tannery,	Gate of Tekoa,	S. "
8. Golden Gate, *Bâb ed Daherîyeh*,	Golden Gate.....		E. "

In 680 the city had eighty-four towers. In the 12th century the two principal ones were—first, Tancred's tower on the northwest, the present *Ḳal'at Jálúd* (Goliath's castle), where remains of a mediæval square tower of 80 feet side still exist, and, second, David's tower, still so called (the ancient Phasaelus), forming part of the castle of the Pisans, as the present citadel was called in the 16th century.

The walls of the modern city enclose an area of 210 acres, the greater part thickly crowded with houses, although on the northeast and south there are plots of ground near the ramparts not occupied by buildings. The houses are of stone, with flat stone roofs having small domes supported on arches in the middle, and the aspect of the city is specially colorless and stony. The streets are only narrow lanes running at right angles to one another. The principal streets are the same as in the 12th century, and in many cases retain Arabic names at least four hundred years old. They are arched over here and there, and the bazaars, with portions of the Via Dolorosa and of other streets, are entirely covered in. There are now four quarters:—that of the Moslems (including the Haram) on the northeast, the Jewish quarter on the southeast, the Armenian quarter on the southwest, the Christian on the northwest. The quarters are bounded by David (or Temple) Street, running east from the Jaffa gate, and by the street running north and south immediately east of the Holy Sepulchre (called *Hârat el Yehûd* on the south and *Ṭarîḳ Bâb el 'Amûd* on the north). The quarters are not, however, exclusively occupied by any nationality, many rich Jews having houses in the Armenian and even in the Moslem quarter. In the 12th century the present Moslem quarter was occupied by the Jews, and called the *Juiverie*.

Viewed from the Mount of Olives, the most conspicuous object is the Haram enclosure, occupying nearly one-sixth of the city, with the Dome of the Rock rising in the centre and the Aksa mosque extending to the southern wall, while between these two buildings are the tall cypresses which surround the fountain *El Kâs*. Arcades with pointed arches stand on the flights of steps leading to the platform surrounding the Dome of the Rock, and three minarets rise from the west and north walls, while the great eastern rampart is unbroken save by the projecting tower of the Golden gate. In the Jewish quarter two large synagogues with domes—one painted green—are conspicuous, while the church and convent of St. James is the special feature of the Armenian quarter. Close to the Jaffa gate rise the square tower of David, and a minaret within the citadel, while immediately east of this fortress stands the Protestant English church and the large palace of the Anglo-German Protestant bishop. Northeast of these are seen the two domes of the rotunda and choir of the Holy Sepulchre, and immediately south of them the minaret of Omar's mosque, on the site of the great hospital of St. John. The modern Latin cathedral and patriarchate appear behind the Holy Sepulchre church, while the highest ground outside the city on the northwest is occupied by the Russian cathedral, hospice, and consulate, only completed in 1866.

The country round the city is barren and stony. Olive groves exist on the north, and the white slopes of Olivet are dotted with the trees whence it is named. Vineyards also exist on the west, but since the destruction of the fruit trees by Titus (*B. J.*, v. 3, 2) the vicinity of Jerusalem seems always to have presented a sterile appearance.

The number of churches and monasteries in the modern city, without counting many crusading chapels now either in ruins or else converted into mosques, is very large. There are 18 monasteries of the Greek Orthodox sect, 8 Catholic (or Latin), including the patriarchate, 3 Armenian, 2 Coptic, 1 Syrian, 1 Armenian Catholic, 1 Greek Catholic, and 1 Abyssinian. The Protestant institutions, including schools, etc., number 14 in all. In the Jewish quarter there are no less than 14 synagogues and 2 schools. There are also many charitable institutions in and near the city, of which the principal are Rothschild's hospital near the south wall, founded in 1855, and Sir Moses Montefiore's almshouses, west of the great reservoir called *Birket es Sulṭân.* In the centre of the city excavations have been carried on by the German Government (to whom the site was given by the sultan) in the grounds of the crusading convent of Sta. Maria Magna (now called *El Múristán*) immediately east of the hospital of St. John; a Lutheran chapel is now established in the ruins. The Moslem buildings of the city date principally from the 13th, 14th, and 15th centuries, and some of the ancient Moslem schools near the Haram are remarkably solid structures. There are two barracks, one on the scarped rock (Antonia) north of the Haram, the other in the citadel on the southwest. The *serai* or court-house is near the former. All the European powers are represented by resident consuls, and every nationality has some kind of hospice or hotel for the reception of pilgrims. The market-places have remained unchanged from very early times, the upper or vegetable market being in the upper city opposite the tower of David, and the bazaars or lower markets in the valley north of David Street. The money-changers occupy the site of the old exchange of the 12th century (first established by Charlemagne) in the western portion of David Street.

Jerusalem under the Turks is the capital of southern Palestine (about 2000 square miles) and the seat of a *mutaṣarrif* under the *wâly* of Syria. The *mejlis* or town council consists of 8 members,—4 Moslem, 3 Christian, 1 Jewish, the latter being the chief rabbi of the Sephardim. The export trade of the city consists chiefly of oil, corn, sesame, cotton (of poor quality), and soap, also of rosaries, crucifixes, and cameos, carved in olive wood and mother-of-pearl. The imports in 1871 amounted to £72,000, including cotton, wool, hardware, timber, silk, and glass from England and Austria; wines and spirits from France; and £3500 value of flour from Russia. Rice is imported in coasting vessels from Egypt; wine, spirits, dried fish, etc., from Cyprus and the Greek islands; carpets and shawls are brought by the Moslem and Christian pilgrims. There are also a few potteries in the city.

The present cemeteries of Jerusalem are six in number. The Moslem inhabitants bury immediately outside the east wall of the Haram, especially beside and north of the Golden gate, while a second Moslem cemetery exists on the knoll of Jeremiah's grotto, and a third (on the site of the old *Carnarium Leonis*) is close to the Mamilla pool, west of the city. The Christians have cemeteries on the southwest of the brow of Sion, and the Jews are buried on Olivet opposite the temple, excepting the Karaites, who have a cemetery on the southeast part of Sion.

The remains of an old Christian cemetery, including tombs belonging to the old church of St. Sion, are found in the southern boundary valley, and there are a few sepulchres of crusading date near the northeast corner of Jerusalem, on the outside. Of the ancient Jewish tombs the most striking are that known as the Tombs of the Kings, and the monument called Absalom's tomb, on the east of the Kidron valley, which is perhaps the tomb of Alexander Jannæus (*B. J.*, v. 7, 2).

The climate of Jerusalem is healthy in comparison with that of the plains beneath it. A fresh sea breeze blows throughout the day in summer, and the average daily maximum temperature is 86° F. August is the hottest month, but in May the prevalence of dry east winds is specially trying. The autumn months are very unhealthy. In winter there are occasionally heavy falls of snow, which lies on the hills for several days. The waters of the *Bîr Eyûb* overflow annually through a hole in the ground near the well, and a running stream then flows for many days down the Kidron valley. This overflow is a cause of rejoicing to the inhabitants, who make it a holiday occasion. The annual rainfall averages about 18 inches. Years of drought occasionally occur, when the inhabitants of the city suffer much from want of water. The repair of the aqueduct from Bethlehem, and of the large reservoirs in the city would, however, be sufficient to ensure a plentiful supply. The present supply is obtained principally from cisterns under the houses. Slight shocks of earthquake are occasionally experienced (as for instance in 1874), and appear to have been specially prevalent in the 8th and 11th centuries (*cf.* Zech. xiv. 5).

The population of Jerusalem, stated in 1838 at about 11,000, has increased rapidly of late years, owing to a great increase in the Jewish population, which has risen in that time from 3000 to over 10,000 souls. According to a consular estimate in 1872, the population was as follows, the total agreeing very closely with an independent estimate by Frère Lievin the Franciscan; Jews (Sephardim, 4600; Ashkenazim, 6000), 10,600; Moslems, 5000; Christians, 5300; total, 20,900.

At Easter this population is increased by about 5000 pilgrims, who crowd the narrow streets until they are almost impassable. Throughout the year there are generally about 100 pilgrims in the Russian hospice. The number of Jews is said to be increasing at the rate of 1200 to 1500 souls per annum, chiefly through fresh arrivals from Russia and Poland. A building-club has been established and 130 houses erected in four years by the Jews, outside the walls. Along the Jaffa road many country villas have also been erected of late by European residents as summer abodes.

A very large majority of the Christians in Jerusalem are either priests, monks, or nuns. The majority belong to the Greek Orthodox church (about 2800 souls). The Greek patriarch has a province including all Palestine, with ten bishops, viz., of Nazareth, Acre, Kerak, Tabor, Bethlehem, Lydda, Gaza, Nablus, Es Salt, and Sebastieh, the last five being residents in Jerusalem. The Russian cathedral is presided over by an archimandrite with two assistant priests and a deacon.

The Latins in Palestine are not numerous, the country villages when Christian belonging generally to the Greek church. The Latin priests and monks are principally Jesuits and Franciscans. The number of Latins in Jerusalem is about 1500. Their churches are the cathedral of St. Saviour, close to the patriarchate on the west, and the chapel of the Flagellation. They have established also many useful institutions, including a boys' school for 150 and a girls' school for 100 pupils.

The number of Armenian and Greek Catholics together does not exceed 50 souls. The orthodox Armenians are the richest sect in the city, numbering about 500. Great numbers of Armenian pilgrims visit the city, and their hospice (for 2000) is the largest in Jerusalem. Their principal church is that of St. James on Sion. The Protestants (about 300) belong to the English Church and the Lutheran. The bishopric was established by England and Prussia in 1841. The mission to the Jews was established in 1824, and supports a hospital and church with resident chaplain and parsonage, a boys' school, and other institutions. There are also several German institutions, including a girls' school and an orphanage outside the walls. The remaining Christian sects, Copts, Syrians, and Abyssinians, number about 200 souls. For the Jews in Jerusalem see Jews, page 697 of the present volume.

The streets of Jerusalem at Easter present a strange spectacle from the numerous national costumes seen together. The European tourist, the Turkish nizam, the hooded Armenian, the long-haired Greek monk, are mingled with the native peasants in yellow turbans and striped mantles, with Armenian pilgrims wearing broad red sashes, Jews in Oriental costume or with the fur cap and lovelocks of the Pharisee, Russians in knee-boots and padded robes, and native ladies in white mantles with black face veils. The architecture of the city, Oriental, Gothic, Byzantine, or Italian, tells the same story—that Jerusalem has been for eighteen centuries a holy city in the eyes of Jew, Christian, and Moslem alike, and the religious centre of half the world. (C. R. C.)

Literature.—For the oldest period the Bible is the only source; for the city of Herod Josephus, to whom classical authors (Strabo, Tacitus) add little. The Talmudic material has been collected by Neubauer *Géographie du Talmud*, Paris, 1868; comp. Schwarz's *Palestine* (תבואות הארץ, 1845; Eng. transl., Philadelphia, 1850; German transl., 1852). The materials for Christian Jerusalem in patristic literature, histories, and pilgrimages are immense. The best list is Tobler's *Bibliographia Geographica Palestinæ*, Leips., 1867, with the supplement (1875) for 383–1000 A.D. See also A. B. M'Grigor's *Index of Passages bearing upon the Topography from Writings prior to the 11th century*, Glasgow, 1876. The Arabic sources have hitherto been imperfectly utilized. Of the more ancient Istakhry and Moḳaddasy (988 A.D.), on whom Yáḳút and Ḳazwíní mainly depend, deserve special notice. For Arabic works on Jerusalem see Ḥ. Khalífa, ii. 139. Recent writers have chiefly followed two very modern works, the *Uns Jalíl* of Mujír ed Dín (1494 A.D., see Ḥ. Kh., i. 453), of which extracts are given by Williams (vol. i., app. 2), and by Sauvaire (*Hist de Jérusalem et d'Hebron*, 1876), and the *Itḥáf el Aḥiṣṣá* of Kemál ed Dín (1470 A.D., see Ḥ. Kh., i. 148), which through an error of the translator Reynolds (Lond., 1836, is often ascribed to the famous Jelál ed Dín (Soyúty). This book by no means deserves the authority attached to it by English writers. Results of recent research are embodied in the ordnance survey map, 1865; Zimmermann's maps, 1876, 1880; Warren's *Recovery of Jerusalem*, 1871. Of the innumerable topographical discussions (excluding works specially devoted to the Temple and Holy Sepulchre) may be named Reland, *Palæstina*, 1714; Olshausen, *Zur Topographie des alten Jerusalem*, 1833; Fergusson, *Topography of Jerusalem*, 1847; Robinson, *Biblical Researches;* Thrupp, *Ancient Jerusalem*, 1855; Lewin, *Siege of Jerusalem by Titus*, 1863; Williams, *The Holy City*, 2d ed., 1849; Furrer, *Wanderungen*, 1865; Id., "Jerusalem" in Schenkel's *Bib. Lex.* For the history see Williams, *op. cit.*, and Besant and Palmer, *Jerusalem*, 1871 (from crusading and Arabic sources). Socin-Badeker's *Handbook* deserves special notice.

JESI, a city in the circle and province of Ancona, Italy, is situated on a slight eminence on the left bank of the Esino, 17 miles west-southwest of Ancona, with which it is connected by rail. It is surrounded by a wall with towers. The streets, of which the Corso is the finest, are fairly good, and contain several noteworthy buildings, including a theatre and several churches. The cathedral, restored in the 18th century, is dedicated to St. Septimius the martyr, who was first bishop of the see in 308. Jesi possesses a hospital and several benevolent institutions, besides a seminary, a lyceum, a communal college, and other educational establishments. It is one of the most active industrial towns of the province. Its manufactories include silk and woollen stockings, paper, cordage, leather, etc.; and it carries on trade in wine, oil, and grain. Jesi takes its title of "royal" city from having been the birthplace of the emperor Frederick II. in 1194. The population is 11,469.

Jesi represents the Roman colony and municipium *Æsis* (in Strabo, *Æsium*), which traces a traditional origin to the Pelasgi. Vestiges of Roman remains render improbable the opinion that, after being destroyed during the barbarian invasion of Italy, the town was removed to a new site. Jesi was a bone of contention between the Longobardi and the Byzantine exarchs, who alternately possessed it. Ultimately it fell into the hands of the Franks. During the early Middle Ages it enjoyed prosperity under Frederick II. and his immediate successors; but about the beginning of the 14th century it began to have its full share of internal and external troubles. It passed into the power of the Holy See in the pontificate of Nicholas V. (1447–1455); under Napoleon it figured as a vice-prefecture; and in 1860 it was incorporated with the kingdom of Italy.

JESSE, Edward (1780–1868), a writer on natural history, was born 14th January, 1780, at Hutton Cranswick, Yorkshire, where his father was vicar. He became clerk in one of the Government offices in 1798, and for a time was secretary to Lord Dartmouth, when president of the Board of Control, through whom he also received an office at court. In 1812 he was appointed commissioner of hackney coaches, and not long afterwards he became deputy surveyor-general of the royal parks and palaces. On the abolition of this office he retired on a pension, and he died at Brighton, 28th March, 1868. The office which Mr. Jesse filled in connection with the royal parks induced him to take a considerable interest in the habits and characteristics of animals, the result of which was seen in a series of pleasant and popular books on natural history, the principal of which are *Gleanings in Natural History*, 3 vols., 1832–35; *An Angler's Rambles*, 1836; *Anecdotes of Dogs*, 1846; and *Lectures on Natural History*, 1863. He also edited Walton's *Complete Angler*, White's *Selborne*, and Ritchie's *Windsor Castle*, and wrote a number of handbooks to places of interest, including Windsor and Hampton Court.

JESSE, John Heneage (1808–1874), son of Edward Jesse noticed above, was born in 1808. From his early manhood he held an office in the secretary's department of the Admiralty at Whitehall. His first contribution to literature, a poem on Mary Queen of Scots, which he dedicated to Sir Walter Scott, was published in 1829, and this was followed in 1830 by a collection of poems entitled *Tales of the Dead*. Among his other efforts in verse were a drama (*Richard III.*) and a fragmentary poem entitled *London*, dedicated to Mr. Rogers, the poet. None of these ventures achieved any success, but his series of historical works, which together form a continuous narrative from the reign of Richard III. to that of George III. inclusive, are written with vivacity and interest, and in their own style are a not unimportant contribution to the history of England. His *Memoirs of the Court of England during the Reign of the Stuarts* was published in 1839–40, *Memoirs of the Court of London from the Revolution of* 1688 *to the Death of George II.* in 1843, *George Selwyn and his Contemporaries* in 1844, *Memoirs of the Pretenders and their Adherents* in 1845, *Richard the Third and his Contemporaries* in 1861, and *Memoirs of the Life and Reign of King George the Third* in 1867. The titles of these works are sufficiently indicative of their character. They are sketches of the principal personages and of the social details of various periods in the history of England rather than complete and comprehensive historical narratives. In addition to these works, Mr. Jesse wrote *Literary and Historical Memoirs of London*, 1847, and *London and its Celebrities*, 1871. His *Memoirs of Celebrated Etonians* appeared in 1875. He died July 7, 1874.

JESSELMERE, a form of Jáisalmir (*q.v.*).

JESSOR, or Jessore, a British district in the lieutenant-governorship of Bengal, lying between 22° 25′ 50″ and 23° 47′ N. lat., and between 88° 57′ 33″ and 90° 0′ 13″ E. long., with an area (1878) of 3658 square miles, forms the eastern portion of the presidency division. It is bounded on the N. and W. by Nadiyá district, on the S. by the Sundarbans, and on the E. by the district of Farídpur.

Jessor forms the central portion of the delta between the Hooghly and the united Ganges and Brahmaputra. It is a vast alluvial plain intersected by rivers and watercourses, which at places in the southern portion of the district spread out into large marshes. The northern part of the district is verdant, with extensive groves of date-palms; villages are numerous and large; and the people are prosperous. In the central portion the population is sparse, the only part of the tract suitable for dwellings being the high land on the banks of rivers. The principal rivers of Jessor are the Madhumatí (which forms the eastern boundary of the district), with its tributaries the Nabagangá, Chitra, and Bhairab; the Kumár, Kabadak, Katkí, Harihar, Bhadrá, and Athárábánká. Within the last century the rivers in the interior of Jessor have ceased to be true deltaic rivers; and, whereas the northern portion of the district formerly lay under water for several months every year, it is now reached only by unusual inundations. The tide reaches as far north as the latitude of Jessor town.

The population of Jessor in 1872 numbered 2,075,021, of whom 1,051,126 were males and 1,023,895 females. The inhabitants of the district are all Bengalis; the better classes are Hindus, the lower orders being principally Mahometans. The Hindus number 915,413, the Musalmáns 1,151,936, and the Christians 1142. The Bráhma Samáj has a few adherents. Among the lower ranks, the fishing and boating castes deserve attention, the fisheries in the rivers and deeper swamps being very valuable, and the right to fish being a regular tenure paid for like the right to cultivate land. Jessor is noted for a colony of pure Kulin Bráhmans, who live at Lakshmípásá, a village on the Nabagangá. These Kulins trace their origin to Ramánand Chakrabarttí, who five generations ago emigrated from Sarmangal in Bákarganj, a great Kulin settlement. The only place with a population exceeding 5000 is Jessor town, which has 8152.

The principal staple in Jessor is rice; among other crops are barley, Indian corn, pease, mustard, jute, tobacco, potatoes, sugar-cane, indigo, *pán*, dates, etc. The total cultivated area is about 1,381,800 acres, more than a million of which are said to be under rice. The estimated area covered by date-palms for the manufacture of sugar is 17,500 acres. The area under indigo is 31,333 acres. The total produce is 1872–73 was 203 tons, valued at £114,400. There are about fifty-five European factories, besides fifty worked in the interest of native proprietors under European or native management. Blights occur occasionally. The district is subject to heavy floods, which have sometimes been immediately followed by disastrous cyclones. Several inundations have taken place, causing famine.

The trade of Jessor is carried on chiefly by means of permanent markets, but there is also a considerable traffic at the numerous fairs and religious gatherings held throughout the district. The chief exports are sugar, indigo, rice, pulse, timber, honey, shells, etc.; the chief imports are salt, English goods, and cloth. The principal manufactures are date-sugar and indigo. The police-force consisted in 1871 of 590 officers and men, maintained at a cost of £13,548. In 1871 the number of Government and aided schools was 390, with 12,349 pupils. The climate does not differ from that of the other districts of Lower Bengal. April, May, and June are very trying, their average mean temperature being 83°.6 Fahr. The average rainfall is about 65 inches. Malarious diseases are very prevalent, intermittent fever being common throughout the year. Cholera breaks out every hot season.

British administration was completely established in the district in 1781, when the governor-general ordered the opening of a court at Murálí near Jessor. Before that, however, the fiscal administration of the district had been in the hands of the English, having been transferred to the East India Company with that of the rest of Bengal in 1765. The changes in jurisdiction in Jessor have been very numerous. After many transfers and rectifications, the district was in 1863 finally constituted as it at present stands. The rájás of Jessor or Chánchrá trace their origin to Bhábeswar Rái, a soldier in the army of Khán-i-Azam, an imperial general, who deprived Rájá Pratápáditya, the popular hero of the Sundarbans, of several fiscal divisions, and conferred them on Bhábeswar. But Manohar Rái (1649–1705) is regarded as the principal founder of the family. The estate when he inherited it was of moderate size, but he acquired one parganá after another, until, at his death, the property was by far the largest in the neighborhood.

JESUITS. The "Company of Jesus," in its original conception, and in its avowed or ostensible objects, does not at the first glance appear as more than one of many similar communities which have grown up in the bosom of Latin Christianity. Like several of them, it is a congregation of ecclesiastics living in accordance with a definite rule, whence technically called "Clerks Regular"; like the Templars, Hospitallers, and Teutonic Knights, military ideas have entered largely into its plans; like Benedictines, Dominicans, and Franciscans, its spiritual labors have been those of teaching the young by schools and catechizings, conducting home missions by such agencies as sermons, retreats, and the like, combating heresy with the pulpit and the pen, and converting the heathen. In each and all of these peculiarities and occupations it comes late into a field where its precursors had been busy for centuries, and it might seem to differ from them merely by a more careful selection of instruments, a more skilful organization, and a more perfect discipline.

But such a view is entirely misleading. On closer examination the Jesuit body proves to resemble those other religious societies only in external and separable accidents, differing from them and from all others in its essential character,— and that not in degree merely, but in kind also, so as to be an institution absolutely unique in history.

In the first place, all the earlier associations of the kind, even the military orders themselves, have their origin in a desire to withdraw so far as possible from contact with the world and its concerns, to seek spiritual perfection in a retired life of contemplation and prayer, to concentrate efforts for this end chiefly within the cloister where each such group is collected, and to act only indirectly, and as it were with the mere surplus overflow of religious energy, on their more immediate neighbors around, and even then chiefly with the idea of persuading all the most devout and fervent amongst them to forsake the world in a similar fashion. Contrariwise, the Jesuit system is to withdraw religious men from precisely this sort of retirement, except as a mere temporary preparation for later activity, and to make habitual intercourse with society a prime duty, rigidly suppressing all such external regulations of dress, rule, and austerities as tend to put obstacles in the way, so leaving the members of the "Company" free to act as emissaries, agents, or missionaries in the most various places and circumstances. Next, the constitution of the elder societies was for the most part democratic. Allowing for special exceptions, the normal scheme of government was this. Each house of an order had a separate life and partial independence of its own. It elected its own superior and officers, usually by ballot, for a short term of years, it discussed its business, and its members confessed their faults, in open chapter. Each group of houses elected a provincial; the provincials, or delegates from among them, elected the general, whose authority was strictly constitutional, and limited as definitely by the rule and statutes as the rights of the youngest novice. Further, admission was seldom difficult; the noviciate rarely exceeded two years, and the novice, professed at the close of that probation, at once entered on a share in the government of the society, and became eligible for its highest offices. Unlike this method in every respect, the Jesuit polity is almost a pure despotism, guarded, no doubt, with certain checks, but even those of an oligarchical kind. The general is indeed elected by the congregation of the society; but, once appointed, it is for life, and with powers lodged in his hands, partly due to the original constitutions, and partly to special faculties and privileges conferred by various popes, which enormously exceed, as regards enactment and repeal of laws, as to restraint and dispensation, and both in kind and degree, those wielded by the heads of any other communities. He alone nominates to every office in the society (with certain significant exceptions to be named presently) and appoints the superiors of all the houses and colleges. The vow of obedience is taken directly to him, and not, as in the older orders, to the rule, as distinguished from the mere chief of the executive. The admission or dismissal of every member depends on his absolute fiat; and, by a simple provision for reports to him, he holds in his hands the threads of the entire business of the society in its most minute and distant ramifications.

Once more, the distinguishing peculiarity of the earlier communities, dating from the origin of the Benedictine rule, is their hostility to local change. The vow of *stability*, soon added to the three customary pledges of poverty, chastity, and obedience, was designed to impede, not merely itinerancy without settled abode, such as had brought discredit on those ancient monks who were styled *circumcellions*, nor even easy transition from one religious community to another, unless in search of greater austerity, but even facility of transfer from one house to another of the very same order. Where the profession was made, there, in the absence of exceptional reasons, the life should be spent; and this rule of course tended to nationalism in the monasteries of every country, even in the great military orders, which, though accepting recruits from all quarters, yet grouped them into *tongues*. But mobility and cosmopolitanism are of the very essence of the Jesuit programme. The founder of the society has excluded the possibility of doubt on this subject, for having chosen the military term "Company," rather than "Order" or "Congregation" to describe his new institute, he explained its meaning to Paul III. as being that, whereas the ancient monastic communities were, so to speak, the infantry of the church, whose duty was to stand firmly in one place on the battlefield, the Jesuits, contrariwise, were to be the "light horse," capable of going anywhere at a moment's notice, but especially apt and designed for scouting or skirmishing. And, to carry out this view, it was one of his plans to send foreigners as superiors or officers to the Jesuit houses of each country, requiring of these envoys, however, to use invariably the language of their new place of residence, and to study it both in speaking and writing till entire mastery of it had been acquired,—thus by degrees making all the parts of his vast system mutually interchangeable, and so largely increasing the number of persons eligible to fill any given post, without reference to locality.

Further, the object of the older monastic societies was the sanctification of their individual members. In truth, community life was only a later development of the original system, as exhibited in the Thebaid, in accordance with which solitary hermits began to draw near to each other, until the collection of separate huts gradually assumed the form of a *laura* or hamlet of cells, grouped under an abbot, and with a common place of worship—a model still surviving in the Camaldolese order. Their obedience to a superior, and the observance of some kind of fixed rule, had no further intention than the improvement of the spiritual character of each person who entered such a community; and, with certain qualifications, this has continued the ideal of the older orders,—modified chiefly by the natural desire of each such body to gain influence and credit from the personal character of all its members and the efficiency of its active operations. But the founder of Jesuitism started at once with a totally different purpose. To him, from the first, the society was everything, and the individual nothing, except so far as he might prove a useful instrument for carrying out the society's objects. In a MS. collection of sayings by Loyola, whose genuineness is accepted by the Bollandists, themselves Jesuits, and by his biographer F. Genelli, he is stated to have said to his secretary, Polanco, that "in those who offered themselves he looked less to purely natural goodness than to firmness of character and ability for business, for he was of opinion that those who were not fit for public business were not adapted for filling offices in the society." He went even further than this, and laid down that even exceptional qualities and endowments in a candidate were valuable in his eyes only on the condition of their being brought into play or held in abeyance strictly at the command of a superior. On this principle, he raised obedience to a position it had never held before, even amongst monastic virtues. His letter on this subject, addressed to the Jesuits of Coimbra in 1553, is still one of the standard formularies of the society, ranking with those two other products of his pen, the *Spiritual Exercises* and the *Constitutions;* and it is evident that his views differ very seriously from the older theories on the subject, as formulated in other rules. In them the superior is head of a local family, endued with paternal authority, no doubt as understood by the old civil code of the Roman empire, centuries after the very memory of freedom had been lost, yet having fixed limits, alike traditional and prescribed, besides being exercised only within a limited area and for certain specified purposes. Loyola, true to his military training and instincts, clothes the general with the powers of a commander-in-chief of an army in time of war, giving him the absolute disposal of all members of the society in every place and for every purpose. Not only so, but he pushes the claim much further, requiring, besides entire outward submission to command, also the complete identification of the inferior's will with that of the superior. He lays down that this superior is to be obeyed simply as such, and as standing in the place of God, without reference to his personal wisdom, piety, or discretion: that any obedience which falls short of making the superior's will one's own in inward affection as well as in palpable effect, is lax and imperfect; that going beyond the letter of command, even in things abstractly good and praiseworthy, is disobedience; and that the "sacrifice of the intellect"—a familiar Jesuit watchword—is the third and highest grade of obedience, well-pleasing to God, when the inferior not only wills what the superior wills, but thinks what he thinks, submitting his judgment so far as it is possible for the will to influence and lead the judgment. So far-reaching and dangerous are these maxims that the *Letter on Obedience* was formally condemned, not long after Loyola's death, by the Inquisition in Spain and Portugal, and it tasked all the skill and learning of Bellarmine as its apologist, together with the whole influence of the company, to avert the ratification of the sentence at Rome.

It has, however, been alleged in defence that this very strong language must be glossed and limited by two other maxims penned by Loyola: (1) "Preserve your freedom of mind, and do not relinquish it by the authority of any person, or in any circumstances whatever"; and (2) "In all things *except sin* I ought to do the will of my superior, and not my own." But the value of these checks is seriously diminished when it is added that the former of them occur in the introductory part of the *Spiritual Exercises*, a manual expressly designed and used for the purpose of breaking down the will of those who pass through its appointed ordeal under a director; while the latter is qualified in its turn, not only by the whole principle of probabilism, the special doctrine of the society, which can attenuate and even defend any kind of sin, but by the four following maxims, in close juxtaposition to itself in the very same document: "I ought to desire to be ruled by a superior who endeavors to subjugate my judgment or subdue my understanding"; "When it seems to me that I am commanded by my superior to do a thing against which my conscience revolts as sinful, and my superior judges otherwise, it is my duty to yield my doubts to him, unless I am otherwise constrained by evident reasons"; "If submission do not appease my conscience, I must impart my doubts to two or three persons of discretion, and abide by their decision"; "I ought not to be my own, but His who created me, and his too by whose means God governs me, yielding myself to be moulded in his hands like so much wax. . . . . I ought to be like a corpse, which has neither will nor understanding, or like a small crucifix, which is turned about at the will of him that holds it, or like a staff in the hands of an old man, who uses it as may best assist or please him." And one master-stroke of Loyola's policy was to insure the permanence of this submission by barring access to all independent positions on the part of members of the society, through means of a special constitution that no Jesuit can accept a cardinal's hat, a bishopric other than missionary, an abbacy, or any similar dignity, save with permission of the general, not to be accorded unless and until the pope has commended its acceptance under pain of sin.

The next matter for consideration is the machinery by which the society is constituted and governed, so as to enable this principle to become a living energy, and not a mere abstract theory. The society, then, is distributed into six grades:—novices, scholastics, temporal coadjutors, spiritual coadjutors, professed of the three vows, and professed of the four vows. The novice cannot become a postulant for admission to the society till fourteen years old, unless by special dispensation, and is at once classified according as his destination is the priesthood or lay brotherhood, while a third class of "indifferents" receives such as are reserved for further inquiry before a decision of this kind is made. They first undergo a strict retreat of a month in what is practically solitary confinement, during which they go through the *Spiritual Exercises*, and make a general confession of their whole previous life; after which the first noviciate, of two years' duration, begins. This is spent partly in daily study, partly in hospital work, and partly in teaching the rudiments of religious doctrine to children and the poor. They may leave or be dismissed at any time during this noviciate, but if approved are advanced into the grade of scholastics, corresponding in some degree to that of undergraduates at a university. The ordinary course for these is five years in arts, when, without discontinuing their own studies, they must pass five or six years more in teaching junior classes, not reaching the study of theology till the age of twenty-eight or thirty, when, after another year of noviciate, a further course of from four to six years is imposed, and not till this has been completed can the scholastic be ordained as a priest of the society, and enter on the grade of spiritual coadjutor, assuming that he is not confined to that of temporal coadjutor, who discharges only such functions as are open to lay-brothers, and who must be ten years in the society before being admitted to the vows. The time can be shortened at the general's pleasure, but such is the normal arrangement. Even this rank confers no share in the government, nor eligibility for the offices of the society. That is reserved for the professed, themselves subdivided into those of the three vows and of the four vows. It is these last alone, forming only a small percentage of the entire body, who constitute the real core of the society, whence its officers are all taken, and their fourth vow is one of special allegiance to the pope, promising to go in obedience to him for missionary purposes whensoever and whithersoever he may order,—a pledge seriously qualified in practice, however, by the power given to the general of alone sending out or recalling any missionary. The constitutions enjoin, by a rule seldom dispensed with, that this final grade cannot be attained till the candidate has reached his forty-fifth year, which involves a probation of no fewer than thirty-one years for even such as have entered on the noviciate at the earliest legal age. These various members of the society are distributed in its noviciate houses, its colleges, its professed houses, and its mission residences. The question has long been hotly debated whether, in addition to these six avowed grades, there be not a seventh, answering in some degree to the Tertiaries of the Franciscan and Dominican orders, secretly affiliated to the society, and acting as its unsuspected emissaries in various lay positions. This class is styled in France "Jesuits of the short robe," and some evidence in support of its actual existence was alleged during the lawsuits against the company under Louis XV. The Jesuits themselves deny the existence of any such body, and are able to adduce the negative disproof that no provision for it is to be found in their constitutions. On the other hand, there are clauses therein which make the creation of such a class perfectly feasible if thought expedient. One is the power given to the general to receive candidates secretly, and to conceal their admission, for which there is a remarkable precedent in the case of Francis Borgia, duke of Gandia, afterwards himself general of the society; the other is an even more singular clause, providing for the admission of candidates to the company by persons who are not themselves members of it. The known facts on either side are insufficient for a decisive verdict, and "Not proven" is the only impartial judgment possible. The general, who should by the statutes of the society reside permanently at Rome, holds in his hands the right of appointment, not only to the office of provincial over each of the great districts into which the houses are mapped, but to the offices of each house in particular, no shadow of electoral right or even suggestion being recognized.

The superiors and rectors of all houses and colleges in Europe must report weekly to their provincial on all matters concerning the members of the society and all outsiders with whom they may have had dealings of any sort. Those employed in district missions report at such longer intervals as the provincial may fix. The provincial, for his part, must report monthly to the general, giving him a summary of all details which have reached himself. But, as a check on him, all superiors of houses in his province are to make separate reports directly to the general once in three months, and further to communicate with him without delay every time any matter of importance occurs, irrespective of any information which the provincial may have forwarded. Nor is this all; an elaborate system of espionage and delation forms part of the recognized order of every house, and, in direct contrast to the ancient indictment and confession of faults in open conventual chapter, every inmate of a house is liable to secret accusation to its superior, while the superior himself may be similarly delated to the provincial or the general.

Nor is the general himself exempt from control on the part of the society, lest by any possibility he might prove, from disaffection or error, unfaithful to its interests. A consultative council is imposed on him by the general congregation, consisting of six persons, whom he may neither select nor remove,—namely, four assistants, each representing a nation, an admonisher or adviser (resembling the *adlatus* of a military commander) to warn him of any faults or mistakes, and his confessor. One of these must be in constant attendance on him; and, while he is not at liberty to abdicate his office, nor to accept any dignity or office outside it without the assent of the society, he may yet be suspended or deposed by its authority. No such instance, however, has yet occurred in Jesuit history, although steps in this direction were once taken in the case of a general who had set himself against the current feeling of the society. With so widely ramifying and complex a system in full working order, controlled by the hand of one man, the Company of Jesus has been aptly defined as "a naked sword, whose hilt is at Rome, and whose point is everywhere."

There would seem at first to be an effectual external check provided, however, in the fact that, while all the officers of the society, except the council aforesaid, hold of the general, he in turn holds of the pope, and is his liegeman directly, as well as in virtue of the fourth vow, which he has taken in common with the other professed. But such is the extraordinary skill with which the relations of the society to the papacy were originally drafted by Loyola, and subsequently worked by his successors, that it has always remained organically independent, and might very conceivably break with Rome without imperilling its own existence. The general has usually stood towards the pope much as a powerful grand feudatory of the Middle Ages did towards a weak titular lord paramount, or perhaps as the captain of a splendid host of "Free Companions" did towards a potentate with whom he chose to take temporary and precarious service; and the shrewd Roman populace have long shown their recognition of this fact by styling these two great personages severally the "White Pope" and the "Black Pope." In truth, the society has never, from the very first, obeyed the pope, whenever its will and his happened to run counter to each other. Even in the very infancy of the company, Loyola himself used supplications and arguments to the pope to dissuade him from enforcing injunctions likely to prove incompatible with the original plan, and on each occasion succeeded in carrying his point; while his immediate successors more openly resisted Paul IV. when attempting to enforce the daily recitation of the breviary on the clerks of the society, and to limit the tenure of the generalship to three years, and Pius V. when following his predecessor's example in the former respect. Sixtus V. having undertaken with a high hand the wholesale reform of the company, including the change of its name from "Society of Jesus" to "Society of Ignatius," met with strenuous opposition, and the fulfilment of Bellarmine's prophecy that he would not survive the year 1590 was looked on less as the accomplishment of a prediction than of a threat,—an impression deepened by the sudden death of his successor, Urban VII., eleven days after his election, who, as Cardinal Castagna, had been actively co-operating with Sixtus in his plans. The accuracy of a similar forecast made by Bellarmine as to Clement VIII., who was also at feud with the society, and who died before he could carry out his intended measures, confirmed popular suspicion. Urban VIII., Innocent XI., Alexander VIII., and Clement XII. vainly contended against the doctrines taught in Jesuit books and colleges, and could effect no change. Nine popes fruitlessly condemned the "Chinese rites," whereby the Jesuit missionaries had virtually assimilated Christianity to heathenism, and the practical reply of the latter was to obtain in 1700 an edict from the emperor of China, in opposition to the papal decree, declaring that there was nothing idolatrous or superstitious in the inculpated usages, while in 1710 they flung Cardinal Tournon, legate of Clement XI., into the prison of the Inquisition at Macao, where he perished; and finally, they disobeyed the brief of suppression issued by Clement XIV. in 1773, which enjoined them to disperse at once, to send back all novices to their houses, and to receive no more members. It is thus clear that the society has always regarded itself as an independent power, ready indeed to co-oporate with the papacy so long as their roads and interests are the same, and to avail itself to the uttermost of the many pontifical decrees in its own favor, but drawing the line far short of practical submission when their interests diverge.

So constituted, with a skilful combination of strictness and laxity, of complex organization with the minimum of friction in working, the society was admirably devised for its purpose of introducing a new power into the church and the world, and for carrying out effectively every part of its vast programme. Thus equipped, its services to Roman Catholicism have been incalculable. The Jesuits alone rolled back the tide of Protestant advance when that half of Europe which had not already shaken off its allegiance to the papacy was threatening to do so, and the whole honors of the counter-Reformation are theirs singly. They had the sagacity to see, and to admit in their correspondence with their superiors, that the Reformation, as a popular movement, was fully justified by the gross ignorance, negligence, and open vice of the Catholic clergy, whether secular or monastic; and they were shrewd enough to discern the only possible remedies. At a time when primary and even secondary education had in most places become a mere effete and pedantic adherence to obsolete methods, they were bold enough to innovate, less in system than in materials, and, putting fresh spirit and devotion into the work, not merely taught and catechized in a new, fresh, and attractive manner, besides establishing free schools of good quality, but provided new manuals and schoolbooks for their pupils, which were an enormous advance on those they found in use, so that for nearly three centuries the Jesuits were accounted the best schoolmasters in Europe, as they were, till their forcible suppression the other day, confessedly the best in France,—besides having always conciliated the good will of their pupils by mingled firmness and gentleness as teachers. And, although their own methods have in time given way to further improvements, yet they revolutionized instruction as completely as Frederick the Great did modern warfare, and have thus acted, whether they meant it or not, as pioneers of human progress. Again, when the regular clergy had sunk into the moral and intellectual slough which is pictured for us in the writings of Erasmus and in the powerful satire *Epistolæ Obscurorum Virorum*, while there was little of a better kind visible in the lives of the parochial priesthood, the Jesuits won back respect for the clerical calling by their personal culture and the unimpeachable purity of their lives. These are qualities which they have all along carefully maintained, and probably no body of men in the world has been so free from the reproach of discreditable members, or has kept up an equally high average level of intelligence and conduct. As preachers, too, they delivered the pulpit from the bondage of an effete scholasticism, and reached at once a clearness and simplicity of treatment such as the English pulpit scarcely begins to exhibit till after the days of Tillotson; while in literature and theology they count a far larger number of respectable writers than any other religious society can boast. It is in the mission-field, however, that their achievements have been most remarkable, which might fully justify their taking as their motto—

> "Quæ regio in terris nostri non plena laboris?"

Whether toiling amongst the teeming millions of Hindustan and China, laboring amongst the Hurons and Iroquois of North America, governing and civilizing the natives of Brazil and Paraguay, in the missions and "reductions," or ministering, at the hourly risk of his life, to his coreligionists in England under Elizabeth and James I., the Jesuit appears alike devoted, indefatigable, cheerful, and worthy of hearty admiration and respect.

Nevertheless, two most startling and indisputable facts meet the student who pursues the history of this unique society. The first is the universal suspicion and hostility it has incurred,—not, as might reasonably be expected, merely from those Protestants whose avowed and most successful foe it has been, nor yet from the enemies of all clericalism and religious dogma, to whom it is naturally the embodiment of all they most detest, but from every Roman Catholic state and nation in the world, with perhaps the insignificant exception of Belgium. Next is the brand of ultimate failure which has invariably been stamped on all its most promising schemes and efforts. It controlled the policy of Spain, when Spain was aiming, with good reason to hope for success, at the hegemony of Europe, and Spain came out of the struggle well-nigh the last amongst the nations. It secured the monopoly of religious teaching and influence in France under Louis XIV. and XV. only to see an atheistic revolution break out under Louis XVI. and sweep over the nation after a century of such training. It guided the action of James II., lost the crown of England for the house of Stuart, and brought about the limitation of the throne to the

Protestant succession. Its Japanese and Red Indian missions have vanished without leaving a trace behind; its labors in Hindustan did but prepare the way for the English empire there; it was swept out of its Paraguayan domains without power of defence; and, having in our own day concentrated its efforts on the maintenance of the temporal power of the popes, and raised it almost to the rank of a dogma of the Catholic faith, it has seen Rome proclaimed as the capital of united Italy, and a Piedmontese sovereign enthroned in the Quirinal. These two phenomena demand some inquiry and analysis. As regards the former of them, the hostility the Jesuits have encountered has been twofold, political and moral or religious. There has been, from a very early date in their annals, a strong conviction prevalent that the famous motto of the society, "A.M.D.G." (*Ad majorem Dei gloriam*), did not adequately represent its policy and motives, that its first and last aim was its own aggrandizement in power and wealth (for Julius II. had dispensed the general from the vow of poverty, and the colleges also were allowed to hold property), and that it spared no efforts to compass this end, even to the extent of embroiling cabinets, concocting conspiracies, kindling wars, and procuring assassinations. In several of these cases, notably as regards the charges which led to their first expulsion from France and Portugal, inclusive in the latter instance of their exile from Paraguay, the Jesuits are able to make one very telling reply, pleading that motives of statecraft alone, of an unworthy kind, and the evidence of untrustworthy and disreputable agents of their enemies, were suffered to decide the matter. In other cases, as for example the assassination of Henry IV. by Ravaillac, they deny all complicity, and no sufficient proof has ever been adduced against them. But, when full allowance has been made for such rejoinders, there remain several counts of the indictment which are but too clearly made out: as, for instance, their large share, as preachers, in fanning the flames of polemical hatred against the Huguenots under the last two Valois kings, their complicity in the plots against the life of Queen Elizabeth which followed on her excommunication by Pius V.; their responsibility for kindling the Thirty Years' War; the part they took in prompting and directing the cruelties which marked the overthrow of Protestantism in Bohemia; their decisive influence in causing the revocation of the Edict of Nantes, and the expulsion of the Huguenots from the French dominions; and their accountability for precipitating the Franco-German war of 1870. And in regard to a large number of other cases where the evidence against them is defective, it is at least an unfortunate coincidence that there is always direct proof of some Jesuit having been in communication with the actual agents engaged. So it was with the massacre of St. Bartholomew, almost immediately preceded by a visit of the Jesuit general, Francis Borgia, to the French court, though there is no further evidence to connect him therewith; so with Châtel and Ravaillac, the unsuccessful and successful assassins of Henry IV.; so with Jaureguay and Balthasar Gerard, who held the like relation to William the Silent, prince of Orange; so (as is more familiarly known) with the accomplices in the Gunpowder Plot. In all these and several other instances, the precautions which would naturally, and even inevitably, be taken by skilled and wary diplomatists for their own protection are sufficient to account for the lack of direct proof against them, but it is not easy to explain the invariable presence of a Jesuit in the background, on any hypothesis which will secure the complete acquittal of the society from charges of the sort. It is sufficient to say here in illustration that the English Roman Catholics under Elizabeth, addressing the pope with regard to the severe penal laws which oppressed them, laid the whole blame of the Government's action on the Jesuits, as having provoked it by their conspiracies; while the secular priests in England issued in 1601 by the pen of one of their number, William Watson (afterwards executed in 1603), a pamphlet known as *Important Considerations*, to the same effect.

The merited odium which has overtaken the Inquisition, usually officered by Dominicans, has induced the Jesuits, whose own controversial method has for the most part been different, to disclaim all connection with that tribunal, and to represent their society as free from complicity in its acts. But, in truth, it was Ignatius Loyola himself who procured its erection in Portugal in 1545–6, and F. Nithard, one of the very few cardinals of the society, was inquisitor-general of that kingdom in 1655.

The charges against the Jesuits on moral and doctrinal grounds are not less precise, early, numerous, and weighty. Their founder himself was arrested more than once by the Inquisition, and required to give account of his belief and conduct. But Loyola, with all his powerful gifts of intellect, was entirely practical and ethical in his range, and had no turn whatever for speculation, nor desire to reason on, much less question, any of the received dogmas of his church. He was therefore acquitted on every occasion, and sagaciously applied for and obtained each time a formally attested certificate of his orthodoxy, knowing well that, in default of such documents, the fact of his arrest as a suspected heretic would be more distinctly recollected by opponents than that of his honorable dismissal from custody. His successors, however, have not been so fortunate. On doctrinal questions indeed, though their teaching on grace, especially in the form given it by Molina, one of their number, was directly Pelagian (the result of reaction from Luther's teaching, which they had combated in Germany), and condemned by several popes, yet their pertinacity in the long run carried the day, and gained a footing for their opinions which was denied to the opposite tenets of the Jansenists. But the accusations against their moral theology and their action as guides of conduct, nay, as themselves involved in many doubtful transactions, have not been so appeased. They were censured by the Sorbonne as early as 1554, chiefly at the instance of Eustache de Bellay, Bishop of Paris, on grounds of which some were quite true, though others appear to have been at least exaggerations; but they can plead that no other theological faculty of the time joined in the condemnation. Melchior Cano, one of the ablest divines of the 16th century, never ceased to lift up his testimony against them, from their first beginning till his own death in 1560, and, unmollified by the bribe of the bishopric of the Canaries, which their interest procured for him, succeeded in banishing them from the university of Salamanca. St. Charles Borromeo, to whose original advocacy they owed much, and especially the exception made in their favor by the council of Trent (Sess. XXV., xvi.) from the restrictions it laid on other communities, retracted his protection, and expelled them from the colleges and churches which they occupied in his diocese and province of Milan,—a policy wherein he was followed in 1604 by his cousin and successor, the equally saintly Cardinal Frederick Borromeo. The credit of the society was, however, far more seriously damaged by the publication at Cracow in 1612 of an ingenious forgery (whose authorship has been variously ascribed to John Zaorowsky or to Cambilone and Schloss, all ex-Jesuits) entitled *Monita Secreta*, professing to be the authoritative secret instructions drawn up by the general Acquaviva and given by the superiors of the company to its various officers and members, and to have been discovered in MS. by Christian of Brunswick in the Jesuit college at Prague. It is full of suggestions for extending the influence of the Jesuits in various ways, for securing a footing in fresh places, for acquiring wealth, and so forth, all marked with ambition, craft, and unscrupulousness. It had a wide success and popularity, passing through several editions, and, though declared a forgery by a congregation of cardinals specially appointed to examine into it, has not ceased to be reprinted and credited down to the present day. The truth seems to be that, although both caricature and libel, it was drafted by a shrewd and keen observer, who, seeing what the fathers actually did, travelled analytically backwards to find how they did it, and on what methodical system, conjecturally reconstructing the process, and probably coming very near the mark in not a few details. Later on, a formidable assault was made on their moral theology in the famous *Provincial Letters* of Blaise Pascal, eighteen in number, issued under the pen-name of Louis de Montalte, from January, 1656, to March, 1657. Their wit, irony, eloquence, and finished style have kept them alive as one of the great French classics,—a destiny more fortunate than that of two kindred works by Antoine Arnauld, his collaborator in the *Provincial Letters*, namely, *Théologie Morale des Jesuites*, consisting of extracts from writings of members of the society, and *Morale Pratique des Jesuites*, made up of narratives exhibiting the manner in which they carried out their own maxims in their personal action. The reply on behalf of the society to Pascal's charges of lax morality, apart from mere general denials (such as that embodied in F. Ravignan's name for the *Provinciales*, "Le Dictionnaire de la Calomnie"), is broadly as follows. (1) Ignatius Loyola himself, the founder of the society, had a special aversion to untruthfulness in all its forms, to quibbling, equivocation, or even studied obscurity of language, and it would be contrary to the spirit of conformity with his example and institutions for his followers to think and act otherwise. (2) Several of the cases cited by Pascal are mere abstract hypotheses, many of them now obsolete, argued on simply as matter of intellectual exercise, but having no practical bearing whatever. (3) Even such as do belong to the sphere of actual life are of the nature of counsel to spiritual physicians, how to deal with exceptional maladies, and were never intended to fix the standard of moral obligation for the general public. (4) The theory that they were intended for this latter purpose, and do represent the normal teaching of the Jesuit body, becomes more untenable in exact proportion as this immorality is insisted on, because it is matter of notoriety that the Jesuits themselves have been singularly free from personal, as distinguished from corporate, evil repute, and no one pretends that the large numbers of lay-folk whom they have educated or influenced exhibit any great moral inferiority to their neighbors. The third of these replies is the most cogent as regards Pascal, but the real weakness of his attack lies in that nervous dread of appeal to first principles and their logical results which has been the besetting snare of Gallicanism. Afraid to deal with the fact that the society was on the whole what its founder meant it to be, and was merely carrying out his programme, because that admission would have involved challenging Loyola's position as a canonized saint, and the action of the Holy See in approving his institute, Pascal was obliged to go on the historically untenable ground that the Jesuits of his day had degenerated from their original standard; and thus he was not at liberty to go down to that principle which underlies the whole theory of probabilism, namely, the substitution of external authority for the voice of conscience. Hence the ultimate failure of his brilliant attack. The same error of complaining against integral parts of the original system as though they were departures from its spirit marks the treatise of the Jesuit Mariana on certain faults in the government of the society, which was published at Bordeaux soon after his death, in Spanish, French, Latin, and Italian, from a MS. taken from him when he was in prison. The evils he specifies are the spy system (which he declares to be carried so far that, if the general's archives at Rome should be searched, not one Jesuit's character would be found to escape), the monopoly of the higher offices in the hands of a small clique, the narrow range of study, and the absence of encouragement and recompense for the best men of the society. But any fair examination of the constitutions will show that all these belong to the original scheme of government, and should have been challenged on that ground, if at all. Yet, on the broad issue, Pascal's censures have in the main been justified by the subsequent teaching of the society, for the lax casuistry which he held up to ridicule has been formally reproduced in the most modern and popular Jesuit text-book on the subject, that of F. Gury, while the works of Liguori and Scavini, though not of direct Jesuit origin, are yet interpenetrated with the same opinions. And the result of dispassionate examination of these and kindred works—always bearing in mind that no Jesuit writings can be published without special license from the general, after careful scrutiny and review—is that the three principles of probabilism, of mental reservation, and of justification of means by ends, which collectively make up what educated men intend by the term "Jesuitry," are recognized maxims of the society. As the last of these three is at once the most odious in itself and the charge which is most anxiously repelled, it is well to cite three leading Jesuit theologians in proof. Busembaum, whose *Medulla Theologiæ* has been more than fifty times printed, and lately by the Propaganda itself, lays down the maxim in the following terms: "Cum finis est licitus, etiam media sunt licita," and, "Cui licitus est finis, etiam licent media." Layman, similarly, in his *Theologia Moralis*, "Cui concessus est finis, concessa etiam sunt media ad finem ordinata;" and Wagemann, in his *Synopsis Theologiæ Moralis*, yet more tersely, "Finis determinat probitatem actus." In point of fact, many rules of conduct based on these three principles have gradually percolated, as might have been expected, into popular catechisms, and so have weakened the plea that we are dealing only with technical manuals for a professional class; while the plausible defence from the fair average honesty and morality of the lay-folk taught by a clergy which uses these manuals, amounts simply to a confession that the ordinary secular conscience is a safer guide in morals than a Jesuit casuist, since the more nearly the code deducible from his text-books is conformed to the more widely must the pupil diverge from all accredited ethics.

Two causes have been at work to produce the universal failure of the great company in all its plans and efforts. And first stands its lack of powerful intellects. Nothing can be wider from the truth than the popular conception of the ordinary Jesuit as a being of almost superhuman abilities and universal knowledge. The company is without doubt a *corps d'élite*, and an average member of it is of choicer quality than the average member of any equally large body, besides being disciplined by a far more perfect drill. But it takes great men to carry out great plans, and of great men the company has been markedly barren from almost the first. Apart from its mighty founder, and his early colleague Francis Xavier, there are absolutely none who stand in the very first rank. They have had, no doubt, able administrators, like Acquaviva; methodical and lucid compilers, like the Bollandists and Cornelius a Lapide; learned and plausible controversialists, like Bellarmine; elegant preachers, as Bourdaloue, Segneri, and Vieyra; distinguished mathematicians, like Le Seur, Jacquier, and more lately Secchi; but even their one boldest and most original thinker, Denis Petau, has produced no permanent influence over the current of human thought. They have had no Aquinas, no Anselm, no Bacon, no Richelieu. Men whom they trained and who broke loose from their teaching, Pascal, Descartes, Voltaire, have powerfully affected the philosophical and religious beliefs of great masses of mankind, but respectable mediocrity is the brand on the long list of Jesuit names in the catalogues of Alegambe and De Backer. This result is due chiefly to the destructive process of scooping out the will of the Jesuit novice, to replace it with that of his superior (as a watchmaker might fit a new movement into a case), and thereby annihilating in all instances those subtle qualities of individuality and originality which are essential to genius. Men of the highest stamp will either refuse to submit to the process, or will come forth from the mill with their finest qualities pulverized and useless. Nor is this all. The *Ratio Studiorum*, as devised by Acquaviva, and still followed in the colleges of the society, lays down rules which are incompatible with all breadth and progress in the higher forms of education. True to the anti-speculative and traditional side of Loyola's mind, it prescribes that even where religious topics are not in question, the teacher is not to permit any novel opinions or discussions to be mooted; nor to cite himself, or allow others to cite, the opinion of an author not of known repute; nor to teach or suffer to be taught anything contrary to the prevalent opinions of acknowledged doctors current in the schools. Obsolete and false opinions are not to be mentioned at all, even for refutation, nor are objections to received teaching to be dwelt on at any length. The professor of Biblical literature is always to support and defend the Vulgate reading, and to cite the Hebrew and Greek only when they can at least be reconciled therewith; while all versions except the LXX. (which is to be spoken of respectfully) are to be passed over entirely, save when they help to confirm the Vulgate text. In philosophy, Aristotle is to be always followed, and Aquinas generally, care being taken to speak respectfully of him even when abandoning his opinion. It is not wonderful that, under such a method of training, highly cultivated commonplace should be the inevitable average result, and that in proportion as Jesuit power has become dominant in Latin Christendom, the same doom of intellectual sterility, and consequent loss of influence with the higher and thoughtful classes, has spread from the part to the whole. The second cause which has blighted the efforts of the company is the lesson, too faithfully learnt and practised, of making its corporate interests the first object at all times and in all places. The most brilliant exception to this rule is found in some of the foreign missions of the society, and notably in that of St. Francis Xavier. But Xavier quitted Europe in 1541, before the new society had hardened into its final mould, and never returned. His work, so far as we can gather from contemporary accounts, was not done on the true Jesuit lines, though the company has reaped all its credit; and it is even possible that had he succeeded Loyola as general of the Jesuits the institute might have been seriously and healthfully modified. It would almost seem that careful selection was made of the men of greatest piety and enthusiasm, such as Anchieta, Baraza, and Brebeuf, whose unworldliness made them less apt for the diplomatic intrigues of the society in Europe, to break new ground in the various foreign missions, where their successes would throw lustre on the society, and their scruples need never come into play. But such men are rare, and as they died off, their places had to be filled with more sophisticated and ordinary characters, whose one aim was to increase the power and resources of the society. Hence the condescension to heathen rites in Hindustan and China. The first successes of the Indian mission were entirely amongst the lowest class; but when Robert de' Nobili, to win the Brahmans, adopted their insignia and mode of life in 1605—a step sanctioned by Gregory XV. in 1623—the fathers who followed his example, pushed the new caste-feeling so far as absolutely to refuse the ministrations and sacraments of religion to the pariahs, lest the Brahman converts should take offence,—an attempt which was reported to Rome by Norbert, a Capuchin, and by the bishop of Rosalia, and was vainly censured in the pontifical briefs of Innocent X. in 1645, Clement IX. in 1669, Clement XII. in 1734 and 1739, and Benedict XIV. in 1745. The Chinese rites, assailed with equal unsuccess by one pope after another, were not finally put down until 1744, by a bull of Benedict XIV. For Japan, where their side of the story is that best known, we have a remarkable letter, printed by Wadding, addressed to Paul V. by Soleto, a Franciscan missionary, who was martyred in 1624, in which he complains to the pope that the Jesuits had systematically postponed the spiritual welfare of the native Christians to their own convenience and advantage, while, as regards the test of martyrdom, no such result had followed on their teaching, but only on that of the other orders who had undertaken missionary work in Japan. Again, even in Paraguay, the most promising of all Jesuit undertakings, the evidence shows that the fathers, though civilizing the Guarani population just sufficiently to make them useful and docile servants, happier, no doubt, than they were before or after, stopped short there, and employed them simply in raising produce to be traded with for the interests of the society, in accordance with a privilege conferred on them by Gregory XIII., licensing them to engage in commerce.

These examples are sufficient to explain the final collapse of so many promising efforts. The individual Jesuit might be, and often was, a hero, saint, and martyr, but the system of which he was a part, and which he was obliged to administer, is fundamentally unsound, and in contravention of inevitable laws of nature, so that his noblest toils were foredoomed to failure, save in so far as they tended to ennoble and perfect himself, and offered a model for others to imitate.

The influence of the society since its revival in Latin Christendom has not been beneficial. It presents the seeming paradox of the strictest and most irreproachable body amongst the Roman clergy doing nothing to raise the general standard of clerical morals; of that which is collectively the best educated order setting itself to popularize merely emotional and material cults, to the practical neglect and disparagement of more spiritual agencies; of the most intellectual religious teachers deliberately eviscerating the understanding, and endeavoring to substitute mechanical submission to a word of command for intelligent and spontaneous assent to reasonable argument. And yet in all this they are but carrying out the fatal principles of the original institute. True to the teaching of that remarkable panegyric on the society, the *Imago Primi Sæculi Societatis Jesu* (probably written by John Tollenarius in 1640), they have identified the church with their own society, and have considered only what mode of action would make it more easily governed in the same spirit. It is thus for the advantage of such a scheme that laymen should reason as little as possible on questions of theology, that the fathers of the company should hold an acknowledged position of moral and intellectual superiority to the ordinary secular clergy, that all the threads of ecclesiastical authority should be gathered up into one hand, and that one hand in the stronger grasp of the society—a policy modelled exactly on the lines of the concordat of Napoleon I. with Pius VII. Hence the long preparation and elaborate intrigues which issued in the Vatican decrees of papal infallibility and immediate jurisdiction in all dioceses, the ultimate issues of which are still hidden in futurity.

History.

Such being in outline the constitution and character of the Company of Jesus, it remains to summarize its historical career. Don Inigo de Loyola, a nobleman of Guipuzcoa, brave and accomplished, but unversed in letters, was severely wounded at the siege of Pampeluna in 1521, when he was thirty years of age. Sent to his father's castle by his chivalrous captors, he was induced by the reading of some pious books, intended to divert the tedium of illness, to devote himself to a religious life. Quitting his home, he betook himself first to Montserrat and thence, in the garb of a pilgrim, to Manresa, a small town near Barcelona, whence, after serving for a time in the hospital, he withdrew to a cavern close at hand, where, amidst the practice of various austerities, he made the first draft of his famous *Spiritual Exercises*, a work which, often retouched and amplified in his later years, is one of the chief authoritative formularies of his society. Thence he proceeded by way of Barcelona to sail for Italy, and after visiting Rome and Venice, he made a pilgrimage to Jerusalem, intending if possible to establish a missionary society there for the conversion of the Mahometans. Compelled to withdraw by the provincial of the Franciscans, who feared a collision with the Turkish authorities, Loyola returned to Spain, and at thirty-three years of age he attended school at Barcelona to acquire the rudiments of Latin, spending two years there between his studies and such missionary work as was possible for him. He then removed in 1526 to the newly founded university of Alcala, where he first began to gather round him a little band of fellow-workers, holding religious conferences among the students, and giving private instruction besides to various townsfolk. This conduct drew on him the suspicions of the Inquisition, but after a short imprisonment he was released, and migrated to Salamanca, whither two of his friends had preceded him. Here he was again thrown into prison on suspicion of heresy, and formed the plan of going to Paris on recovering his liberty, as a place where he could have more freedom of action, superior teaching, and a greater likelihood of finding able recruits in so central and populous a city for the society he was preparing to found. He reached Paris in 1528, and entered at the college of St. Barbara in the university. Not until his sixth year of residence did he attempt the regular organization of the most promising of the young men whom he drew around him. It was in July, 1534, that he opened his plans to them for starting a missionary society to work in the Holy Land, and the actual vows, binding the new companions to one another and to the sort of life they contemplated, or to direct service of the pope, should that prove impracticable, were taken in the crypt of Notre Dame de Montmartre on August 15, 1534, by Ignatius Loyola himself; Peter Faber or Le Fèvre, a Savoyard; Francis Xavier, Diego Laynez, Alfonso Salmeron, Nicolas Alfonso de Bobadilla, Spaniards; and Simon Rodriguez, a Portuguese. With his usual practical foresight, Loyola postponed the execution of their scheme till January 25, 1537, and provided for its possible modification or abandonment. Three more disciples speedily joined the infant society, Jean Codure, Claude le Jay, and Paschase Brouet. In March, 1535, Loyola quitted Paris, committing his society to Faber, the eldest, and betook himself to Spain, where he remained a few months, and then proceeded to Venice, whence he wrote to summon his companions to join him. They left Paris on November 15, 1536, and reached Venice on January 6, 1537, where their leader had already gained three fresh recruits, Hosez and the two brothers D'Eguia. Remaining in Venice himself for prudential reasons, he sent all the others to Rome to solicit from Paul III. leave to go as missionaries to Jerusalem. They were aided in their application by Pedro Ortiz, the emperor's envoy, and readily obtained the desired permission, with further license to be ordained priests by any bishop, on being duly qualified.

Returning to Venice, they were ordained on St John Baptist's Day, 1537, along with Loyola himself, by Vincenzio (or Antonio) Nigusanti, bishop of Arba. A war which broke out between Turkey and Venice made the intended journey to Palestine impracticable; and accordingly Loyola, Faber, and Laynez betook themselves to Rome, while the others dispersed themselves through the chief university towns of North Italy, and began their work as home missionary preachers; and it was immediately before they separated on this occasion, at Vicenza in November, 1537, that Loyola announced his intention that their fellowship should henceforward be known as the "Company of Jesus," and that, abandoning their original plan of a purely Oriental mission, they should offer themselves to the pope as a special militia. It may be here remarked that the more popular name "Jesuits" seems to have been first used by Calvin, and it appears also in the register of the parliament of Paris as early as 1552, while the enemies of the society in Spain usually spoke of its members as "Inigistas," after the name of its founder.

On their arrival at Rome, the three Jesuits were favorably received by Paul III., who at once appointed Faber to the chair of Biblical exegesis, and Laynez to that of scholastic theology, in the college of Sapienza. But they encountered much opposition, and were even charged with heresy, nay, when this accusation had been disposed of, there still were difficulties in the way of starting any new order. Despite the approval of Contarini, and the goodwill of the pope himself (who is said to have exclaimed, on perusing Loyola's papers, "The finger of God is here"), there was a strong and general feeling that the monastic system had broken down utterly, and could not be wisely developed further. Cardinal Guidiccioni, one of a committee of three appointed to examine the draft constitutions, was known to advocate the abolition of all existing orders save four, which were to be remodelled and put under strict control. And it was that very year, 1538, that a committee of cardinals, consisting of Reginald Pole, Contarini, Sadolet, Caraffa (afterwards Paul IV.), Fregoso, Aleander, and Badia, had just reported to the pope that the conventual orders were such a scandal to Christendom that they should be all abolished—"*abolendos putamus omnes.*" Not only so, but, when greater strictness of rule and of enclosure seemed the most needful reforms in communities which had become too secular in tone, the proposal of Loyola to make it a first principle that the members of his new institute should mix freely with the world, and be as little marked off as possible externally from secular life and usages, ran counter to all tradition and prejudice, save that Caraffa's then recent order of Theatines, from which Loyola copied some details, had taken some steps in the same direction.

Loyola and his companions, however, had little doubt of ultimate success, and so bound themselves, on April 15, 1539, to obey any superior chosen from amongst their body, and added on May 4 certain other rules, the most important of which was the vow of special allegiance to the pope for mission purposes, to be taken by all members of the society. But Guidiccioni, on a careful study of the papers, changed his mind,—partly, it is supposed, because of the strong interest in the new scheme exhibited by the king of Portugal, who instructed his ambassador to press it on the pope, and to ask Loyola himself for some priests of his society for mission work in Portugal and its Indian possessions, and accordingly Xavier and Rodriguez were sent to the king in March, 1540. And on September 27, 1540, the bull *Regimini militantis ecclesiæ* was published, confirming the new order, but limiting its members to sixty, a restriction which was removed by a later bull in March, 1543. In the Latin translation of the original draft constitutions, approved by the pope, the word *compañia* was represented by *societas*, though *cohors* or some such military term would have more exactly reproduced the founder's idea, and thus the Jesuit body is known indifferently as "Company" or "Society," while the title "Order" is never officially given to it. This title was finally settled by Gregory XIV. in a bull of June 28, 1594.

On April 7, 1541, Loyola was unanimously chosen superior. His refusal of this post was overruled, so he entered on his new office on April 13, and on April 15 the newly-constituted society took its formal corporate vows as a religious order in the church of St. Paul-without-the-Walls. The general entered on his duties by holding public catechizings in Sta. Maria in Strata for eight and forty days, a precedent followed ever since by his successors in office. Scarcely was the society launched when its members dispersed in various directions to their new tasks. Salmeron and Brouet were sent, clothed with the powers of papal legates, on a secret mission to Ireland, to encourage the native clergy and people in resistance to the religious changes introduced by Henry VIII.; Bobadilla went to Naples; Faber, first to the diet of Worms, and then to Spain; Laynez and Le Jay to Germany, while their general busied himself in founding the convent of St. Martha at Rome for female penitents, and that of St. Catherine for unprotected young women, as also in perfecting the original draft of the constitutions, a task he did not finish till 1550. Success crowned these first efforts, and the earliest college of the society was founded at Coimbra in 1542 by King John III. of Portugal, who secured the appointment of Simon Rodriguez as its rector. It was designed as a training-school to feed the Indian mission, of which Francis Xavier had already taken the oversight, while a seminary at Goa was the second institution founded out of Rome in connection with the society. In Spain, national pride in the founder aided their cause almost as much as royal patronage in Portugal, and the next house of the society after Goa was opened at Gandia under the protection of its duke, Francis Borgia; in Germany they were eagerly welcomed as the only persons able to meet the Lutherans on equal terms; and only in France, of the countries still belonging to the Roman communion, was their advance checked, owing to political distrust of their Spanish origin, together with the hostility of the Sorbonne and the bishop of Paris. However, after many difficulties, they succeeded in getting a footing through the help of Duprat, bishop of Clermont, who founded a college for them in 1545 in the town of Billom, besides making over to them his house at Paris, the Hôtel de Clermont, which became the nucleus of the afterwards famous college of Louis-le-Grand, while a formal legalization was granted to them by the states-general at Poissy in 1561.

In Rome, Paul III.'s favor did not lessen. He bestowed on them the church of St. Andrea, where now Cardinal Alessandro Farnese's stately erection, the Gesù, stands, and conferred on them at the same time the more valuable privilege of altering their own statutes, besides two others procured in 1546, which Loyola had still more at heart, as touching the very essence of his institute, namely, exemption from ecclesiastical offices and dignities, and from the task of acting as directors and confessors to convents of nuns. The former of these measures effectually stopped any drain of the best members away from the society, and limited their hopes within its bounds, by putting them more fully at the general's disposal, especially as it was provided that the final vows could not be annulled, and that only the joint action of the general and the pope could dismiss a professed member from the society. The regulation as to convents seems due partly to a desire to avoid the worry and expediture of time involved in the discharge of such offices, and partly to a conviction that penitents of the kind would be of no effectual use to the society; whereas Loyola, against the wishes of several of his companions, laid much stress on the duty of accepting the post of confessor to kings, queens, and women of high rank, when opportunity presented itself. And the year 1546 is notable in the annals of the society as that in which it embarked on its great educational career, especially by the annexation of free day-schools to all its colleges.

The council of Trent did much to increase the reputation of the new society, for the pope chose three of its members, Laynez, Faber, and Salmeron, to act as his theologians in that assembly, and they had no little influence in framing its dogmatic definitions and decrees. In 1548 the company received a valuable recruit in the person of Francis Borgia, duke of Gandia, afterwards third general, while two important events marked 1550,—the foundation of the Collegio Romano, and a fresh confirmation of the society by pope Julius III. The German college for the children of poor nobles was founded in 1552, and in the same year Loyola firmly settled the discipline of the society by putting down with promptness and severity some attempts at independent action on the part of Rodriguez at Coimbra; while 1553 saw the despatch of a mission to Abyssinia, and the first quarrel of the society with the pope, who thought that the Spanish Jesuits were taking part with the emperor against the Holy See, but was reconciled by the good offices of Ferdinand, king of the Romans. Paul IV. (whose election at first alarmed the Jesuits, for they had found him not very friendly as Cardinal Caraffa) proved as favorable to them as his predecessors; and when Ignatius Loyola died in 1556, under his pontificate, the society already counted forty-five professed fathers and two thousand ordinary members, distributed over twelve provinces, with more than a hundred colleges and houses. After two years' interregnum, Laynez, who had acted as vicar in the meanwhile, was elected general in 1558, and was successful in a struggle with the pope, who desired to enforce the recitation of the breviary on the society, and to limit the tenure of generalship to a term of three years, but could effect neither object. Laynez also succeeded in increasing further the already enormous powers of the general by adding these four clauses to the constitutions:—that the general alone can make contracts binding the society; that he can authoritatively gloss and interpret the rules and laws, can enact new or repeal old laws, and may have prisons for the incarceration of refractory members. He took a leading part in the colloquy of Poissy in 1561 between the Catholics and Huguenots, and obtained, as already said, a legal footing from the states-general for colleges of the society in France. He died in 1564, leaving the society increased to eighteen provinces, with a hundred and thirty colleges, and was succeeded by Francis Borgia. It was during his generalship that the greatest favor yet vouchsafed the company was bestowed by Pius V., who not only confirmed by bull all former privileges, and extended to it further every privilege that had been or might afterwards be granted to any order with vows of poverty, but also decreed that these letters should at no time be capable of being revoked, limited, or derogated from by the Holy See, nor be included within any revocation of similar or dissimilar privileges, but be forever excepted therefrom. It was a trifling setoff to such a grant that the pope in 1567 again enjoined the fathers to recite the canonical hours in choir, and to admit only the professed to priest's orders, especially as Gregory XIII. rescinded both these injunctions in 1573; and, indeed, as regards the hours, all that Pius V. was able to obtain was the nominal concession that the breviary should be recited in the professed houses only, and that not of necessity by more than two persons at a time. Eberhard Mercurian, a Fleming, succeeded Borgia in 1572 (being forced on the company by the pope, in preference to Polanco, Loyola's secretary and then vicar-general, who was rejected partly as a Spaniard, and still more because he was a "New Christian" of Jewish origin, and therefore objected to in Spain itself), and was in turn followed by Claudio Acquaviva, an able and strong-willed man, who sat from 1581 to 1615, a time almost exactly coinciding with the high tide of the great and successful counter-Reformation movement, chiefly due to the Jesuits, which had begun under Borgia. It was, however, during his generalship that the company's evil reputation began to eclipse its good report, that they first had the pope their avowed enemy, and that they were driven from England (whither they had come chiefly from the seminary founded at Douay by Cardinal Allen in 1568), once in 1581, and again in 1601, as conspirators against the life of Queen Elizabeth, and later again for their share in the Gunpowder Plot; from France as accomplices in the attempt of Châtel to assassinate Henry IV.; and from Antwerp as having resisted the pacification of Ghent. It is true that the edict of the parliament of Paris in 1594, which banished them from France, was revoked in 1603, by desire of Henry IV., who permitted them to return under conditions; and this fact has been much relied on by Jesuit writers in proof of their innocence of all complicity in Châtel's plot. But as Sully has recorded for us that Henry declared his only motive to be the expediency of not driving them into a corner, and so inducing them to murder him through despair or revenge, and that his only hope of tranquillity lay in appeasing them, his conduct does not tell much in their favor.

It was also during Acquaviva's generalship that Philip II. of Spain complained bitterly of the company to Pope Sixtus V., and encouraged him in those plans of reform which were cut short by his death in 1590, and also that the long-protracted discussions on grace, wherein the Dominicans contended against the Jesuits, were carried on at Rome, with little practical result, by the Congregation *De Auxiliis*, which began to sit in 1598, and continued till 1607. He saw too the expulsion of the Jesuits from Venice in 1606 for siding with Paul V. when he placed the republic under an interdict, but did not live to see their recall, which took place at the intercession of Louis XIV. in 1657. But the concessions made to the company by Gregory XIV. successor of Sixtus V., during his short reign of twelve months, almost seemed to compensate for all these troubles; for he not only confirmed all existing privileges, but conferred also that of being able to expel members of the society without any form of trial, or even documentary procedure, besides denouncing excommunication against every one save the pope or his legates who directly or indirectly infringed the constitutions of the society, or attempted to bring about any change therein.

Under Vitelleschi, Acquaviva's successor, the first centenary of the society was held on September 25, 1639, the hundredth anniversary of the verbal approbation given to the draft constitutions by Paul III., and there were then thirty-six provinces, with eight hundred houses, containing fifteen thousand Jesuits. It was in the following year that the great controversy which raged for a century in the Latin Church broke out by the posthumous publication of the *Augustinus* of Cornelius Jansen, bishop of Ypres, in which the Jesuits took the leading part, and finally secured the victory for their teaching throughout the Roman obedience. It was in this same year 1640 that, considering themselves ill-used by the count-duke Olivarez, prime minister of Philip IV. of Spain, they powerfully aided the revolution which placed the duke of Braganza on the throne of Portugal, and their services were rewarded with a practical control of ecclesiastical and almost of civil affairs in that kingdom, which lasted for more than a hundred years.

The society also gained ground steadily in France, for, though held in check during Richelieu's life, and little more favored by Mazarin, yet from the moment Louis XIV. assumed the reins of government, their star was in the ascendant, and Jesuit confessors, the most celebrated of whom were La Chaise and Letellier, guided the policy of the king, not hesitating to take his side in his quarrel with the Holy See, which nearly resulted in a schism, nor to sign the Gallican articles. How their hostility to the Huguenots forced on the revocation of the Edict of Nantes in 1685, and their war against Jansenism did not cease till the very walls of Port Royal were demolished in 1710, even to the abbey church itself, and the bodies of the holy dead taken with every mark of insult from their graves, and literally flung to the dogs to devour, is well known. But while thus gaining power in one direction, the company was losing it in others. The Japanese mission had vanished in blood by 1651, and, though many Jesuit fathers and their converts died bravely as martyrs for the faith, yet it is impossible to acquit them of a large share in the causes of that overthrow. And it was about this same period that the grave scandal of the Chinese and Malabar rites already referred to, began to attract attention in Europe, and to make thinking men ask seriously whether the Jesuit missionaries taught anything which could be fairly called Christianity at all. When it is remembered, too, that they decided in a council at Lima that it was inexpedient to impose any act of Christian devotion except baptism on their South American converts, without the greatest precautions, on the ground of intellectual difficulties, it is not wonderful that this doubt was not satisfactorily cleared up, notably in face of the charges brought against the society by Bernardin de Cardonas, bishop of Paraguay, and the saintly Palafox, bishop of Angelopolis in Mexico, whom they persecuted till he had to fly for his life, and could be protected by the pope himself only by his translation to a European see. As regards their North American work, the Abbé Badiche, continuator of Helyot, pays the Jesuits the doubtful compliment of saying that the Red Indian tribes which accepted the gospel with joy, "learned to mingle Jesus Christ and France together in their affection."

The seeds of decay were already germinating within the company itself. A succession of devout but incapable generals after the death of Acquaviva saw the gradual secularization of tone by the flocking in of recruits of rank and wealth, desirous to share in the glories and influence of the company, but not well adapted to increase them, and too readily admitted on merely temporal grounds; while the old strict discipline was relaxed, as the professed fathers gradually encroached on the general's authority, till they went the length, in 1661, of appointing a vicar-general with powers which practically superseded those of the general, Goswin Nickel, whom they did not think it expedient to depose formally. And though the political weight of the company continued to increase in the cabinets of Europe, yet it was being steadily weakened internally. They abandoned, too, the system of free education, which had won them so much influence and honor; by attaching themselves exclusively to the interests of courts, they lost favor with the middle and lower classes; and, above all, their monopoly of power and patronage in France, with the fatal use they had made of it, drew down the bitterest hostility upon them. It was indeed to their credit that the Encyclopedists attacked them as the foremost representatives of Christianity, but they are accountable in no small degree for the unfavorable opinion of the nature and merits of Christianity itself which their opponents entertained. But that part of the policy of the company which proved most fatal to it, and served as the pretext of the attacks before which it fell, was its activity, wealth, and importance as a great trading firm, with branch houses scattered over the richest producing countries in the world. Its founder, with a wise instinct, had forbidden the accumulation of wealth; its own constitutions, as revised in the eighty-fourth decree of the sixth general congregation, had forbidden all pursuits of a commercial nature, as also had various popes, rescinding the decree of Gregory XIII.; but nevertheless the trade went on unceasingly. The first mutterings of the storm which was soon to break were heard in a severe brief issued in 1741 by Benedict XIV., the most learned and able of the later popes, wherein he denounced the Jesuits as "disobedient, contumacious, captious, and reprobate persons," and enacted many stringent regulations for their better government; and this was followed up by two bulls, *Ex quo singulari* in 1742, and *Omnium sollicitudinum* in 1744, striking at their continued insubordination in the matter of the Chinese rites, which, however, did not save them from an edict of banishment from China itself in 1753, and the last of them disappeared thence in 1774.

The first serious attack came from a country where they had been long dominant. In 1753 Spain and Portugal exchanged certain American provinces with each other, which involved a transfer of sovereign rights over Paraguay, but it was provided that the population should severally migrate also, that the subjects of each crown might remain the same as before. The inhabitants of the "reductions" whom the Jesuits had trained in the use of European arms and discipline rose in revolt, and attacked the troops and authorities. Their previous docility, and their entire submission to the Jesuit missionaries, left no doubt possible as to the source of their rebellion, though direct proof was, as usual, lacking; and the matter was not soon forgotten. In 1757 Carvalho, marquis of Pombal, prime minister of Joseph I. of Portugal, dismissed the three Jesuit chaplains of the king, and named three secular priests in their stead. He next complained to Benedict XIV. that the trading operations of the society hampered the commercial prosperity of the nation, and asked for remedial measures. The pope granted a visitation of the society, and committed it to Cardinal Saldanha, a close intimate of Pombal's. He issued a severe decree against the Jesuits, and ordered the confiscation of all their merchandise.

But at this juncture Benedict XIV. died, and was succeeded much as had happened on several previous occasions, by a pope strongly in favor of the Jesuits, Cardinal Rezzonico, who took the title of Clement XIII. Pombal, finding that no help was to be expected from this quarter, adopted other means. The king was fired at and wounded on returning from an assignation with his mistress, the marchioness of Tavora, September 3, 1758. The duke of Aveiro, the marquis of Tavora, and other persons of high rank were tried and executed for conspiracy, while some of the Jesuits, who had undoubtedly been in communication with them, were charged, on evidence whose value there are no certain means of testing, but which seems very doubtful, with complicity in the attempted assassination. Pombal charged the whole society with its guilt, and, unwilling to await the dubious issue of an application he had made to the pope for license to try them in the civil courts, whence they were exempt, issued a decree on September 1, 1759, ordering their immediate deportation from Portugal and all its dependencies, and their suppression by the bishops in the schools and universities. Those in Portugal were at once shipped to Italy, and such as were in the colonies expelled speedily after. In France, Madame de Pompadour was their enemy,—it is said, because they endeavored to make her break off her connection with Louis XV., and refused her absolution on any other terms; but the immediate cause of their ruin was the bankruptcy of F. Lavalette, the Jesuit administrator of Martinique, a daring speculator, who failed for 2,400,000 francs, and ruined some French commercial houses of note. Ricci, then general of the Jesuits, repudiated the debt, alleging lack of authority on Lavalette's part to pledge the credit of the society, and was sued by the creditors. Losing his cause, he appealed to the parliament of Paris, and it, to decide the issue raised by Ricci, required the constitutions of the Jesuits to be produced in evidence, and affirmed the judgment of the courts below. But the publicity given to a document scarcely known till then (indeed the first authoritative edition of the *Constitutions* is that of Prague in 1757) raised the utmost indignation against the company. A royal commission, appointed by the duke of Choiseul to examine the constitutions, convoked a private assembly of fifty-one archbishops and bishops under the presidency of Cardinal de Luynes, all of whom except six voted that the unlimited authority of the general was incompatible with the laws of France, and that the appointment of a resident vicar, subject to those laws, was the only solution of the question fair on all sides. Ricci replied with the historical answer, "Sint ut sunt, aut non sint"; and after some further delay, during which much interest was exerted in their favor, the Jesuits were suppressed by an edict in November, 1764, but suffered to remain on the footing of secular priests, a grace withdrawn in 1767, when they were expelled from the kingdom. In the very same year Charles III. of Spain, a monarch known for personal devoutness, convinced, on evidence not now forthcoming, that the Jesuits were plotting against his authority, prepared, through his minister D'Aranda, a decree suppressing the society in every part of his dominions. Sealed dispatches were sent to every Spanish colony, to be opened on the same day, April 2, 1767, when the measure was to take effect in Spain itself, and the expulsion was relentlessly carried out, nearly six thousand priests being deported from Spain alone, and sent to the Italian coast, whence, however, they were repelled by the orders of the pope and Ricci himself, finding a refuge at Corte in Corsica, after some months' suffering in overcrowded vessels at sea. The general's object may probably have been to accentuate the harshness with which the fathers had been treated, and so to increase public sympathy, but the actual result of his policy was blame for the cruelty with which he enhanced their misfortunes, for the poverty of Corsica made even a bare subsistence scarcely procurable for them there. The Bourbon courts of Naples and Parma followed the example of France and Spain, and Clement XIII. retorted with a bull launched at the weakest adversary, and declaring the rank and title of the duke of Parma forfeit. The Bourbon sovereigns threatened to make war on the pope in return (France, indeed, seizing on the county of Avignon), and a joint note demanding a retractation, and the abolition of the Jesuits, was presented by the French ambassador at Rome on December 10, 1768, in the name of France, Spain, and the Two Sicilies. The pope, a man of eighty-two, died of apoplexy, brought on by the shock, early in 1769. Cardinal Lorenzo Ganganelli, a Franciscan, was chosen to succeed him, and took the name of Clement XIV. He endeavored to avert the decision forced upon him, but, as Portugal joined the Bourbon league, and Maria Theresa with her son the emperor Joseph II. ceased to protect the Jesuits, there remained only the petty kingdom of Sardinia in their favor, though the fall of Choiseul in France raised the hopes of the society for a time. The pope began with some preliminary measures, permitting first the renewal of lawsuits against the society, which had been suspended by papal authority, and which, indeed, had in no case been ever successful at Rome. He then closed the Collegio Romano, on the plea of its insolvency, seized on the houses at Frascati and Tivoli, and broke up the establishments in Bologna and the Legations at large. Finally, on July 21, 1773, the famous brief *Dominus ac Redemptor* appeared, suppressing the society of Jesus. This remarkable document opens by citing a long series of precedents for the suppression of religious orders by the Holy See, amongst which occurs the ill-omened instance of the Templars. It then briefly sketches the objects and history of the Jesuits themselves. It speaks of their defiance of their own constitution, expressly revived by Paul V., forbidding them to meddle in politics; of the great ruin to souls caused by their quarrels with local ordinaries and the other religious orders, their conformity to heathen usages in the East, and the disturbances, resulting in persecutions of the church, which they had stirred up even in Catholic countries, so that several popes had been obliged to punish them. Seeing then that the Catholic sovereigns had been forced to expel them, that many bishops and other eminent persons demanded their extinction, and that the society had ceased to fulfil the intention of its institute, the pope declares it necessary for the peace of the church that it should be suppressed, extinguished, abolished, and abrogated forever, with all its rites, houses, colleges, schools, and hospitals; transfers all the authority of its general or officers to the local ordinaries; forbids the reception of any more novices, directing that such as were actually in probation should be dismissed, and declaring that profession in the society should not serve as a title to holy orders. Priests of the society are given the option of either joining other orders or remaining as secular clergy, under obedience to the ordinaries, who are empowered to grant or withhold from them licenses to hear confessions. Such of the fathers as are engaged in the work of education are permitted to continue, on condition of abstaining from lax and questionable doctrines, apt to cause strife and trouble. The question of missions is reserved, and the relaxations granted to the society in such matters as fasting, reciting the hours, and reading heretical books, are withdrawn; while the brief ends with clauses carefully drawn to bar any legal exceptions that might be taken against its full validity and obligation. It has been necessary to cite these heads of the brief, because the apologists of the society allege that no motive influenced the pope save the desire of peace at any price, and that he did not believe in the culpability of the fathers. The categorical charges made in the document, and that in the most solemn fashion, rebut this plea. The pope followed up this brief by appointing a congregation of cardinals to take possession of the temporalities of the society, and armed it with summary powers against all who should attempt to retain or conceal any of the property. He also threw Lorenzo Ricci, the general, into prison in the castle of St. Angelo, where he died in 1775, under the pontificate of Pius VI., who, though not unfavorable to the company, and owing his own advancement to it, dared not release him, probably because his continued imprisonment was made a condition by the powers who enjoyed a right of veto in papal elections. In September, 1774, Clement XIV. died after much suffering, and the question has been hotly debated ever since whether poison administered by the Jesuits was the cause of his death. It is impossible to decide the doubt, as the opinions and evidence on each side are nearly balanced. On the one hand, Salicetti, the pope's physician, denied that the body showed signs of poisoning, and Tanucci, Neapolitan ambassador at Rome, who had a large share in procuring the brief of suppression, entirely acquits the Jesuits, while F. Theiner, no friend to the company, does the like. On the other hand, Scipio de' Ricci, bishop of Pistoia, nephew and heir of the unfortunate general, distinctly charges the Jesuits with the crime, as also does Cardinal de Bernis; and the report by the Spanish minister to the court of Madrid, printed by De Potter in his *Vie et Mémoires de Scipion de Ricci*, vol. iii. pp. 151–74, contains the noteworthy fact that the date of the pope's death was predicted beforehand, notably in a statement made by the vicar-general of Padua to the secretary of the congregation for Jesuit affairs, that several members of the company, believing him to be one of their friends, told him that the pope would die before the end of September.

At the date of this suppression, the company had 41 provinces and 22,589 members, of whom 11,295 were priests. Far from submitting to the papal brief, the Jesuits, after some ineffectual attempts at direct resistance, withdrew into the territories of the non-Roman-Catholic sovereigns of Russia and Prussia, Frederick II. and Catharine II., both of them freethinkers, who became their active friends and protectors; and the fathers alleged as a principle, in so far as their theology is concerned, that no papal bull is binding in a state whose sovereign has not approved and authorized its publication and execution. Russia formed the headquarters of the company; and two forged briefs were speedily circulated, being dated June 9 and June 29, 1774, approving their establishment in Russia, and implying the repeal of the brief of suppression. But these are contradicted by the tenor of five genuine briefs, all issued in September of that year to the archbishop of Gnesen, and making certain assurances to the Jesuits, on condition of their complete obedience to the injunctions already laid on them. They also pleaded a verbal approbation by Pius VI., technically known as an *Oraculum vivæ vocis*, but no proof of either its existence or its validity is forthcoming.

They elected three Poles successively as generals, taking, however, only the title of vicars, till on March 7, 1801, Pius VII. granted them liberty to reconstitute themselves in North Russia, and permitted Kareu, then vicar, to exercise full authority as general. On July 30, 1804, a similar brief restored the Jesuits in the Two Sicilies, at the express desire of Ferdinand IV., the pope thus anticipating the further action of 1814, when, by the brief *Sollicitudo omnium Ecclesiarum*, he revoked the action of Clement XIV., and formally restored the society to corporate legal existence, yet not only omitted any censure of his predecessor's conduct, but all vindication of the Jesuits from the heavy charges in the brief *Dominus ac Redemptor*. In France, even after their expulsion in 1765, they had maintained a precarious footing in the country under the partial disguise and names of "Fathers of the Faith," or "Clerks of the Sacred Heart," but were obliged by Napoleon I. to retire in 1804. They reappeared under their true name in 1814, and obtained formal license in 1822, but became the objects of so much hostility that Charles X. deprived them by ordinance of the right of instruction, and obliged all applicants for licenses as teachers to make oath that they did not belong to any community unrecognized by the laws. They were dispersed again by the revolution of July, 1830, but soon reappeared and, though put to much inconvenience during the latter years of Louis Philippe's reign, notably in 1845, maintained their footing, recovered the right to teach freely after the revolution of 1848, and gradually became the leading educational and ecclesiastical power in France, notably under the second empire, till they were once more expelled by the Ferry laws of 1880, though they have been quietly returning since the execution of those measures. In Spain they came back with Ferdinand VII., but were expelled at the constitutional rising in 1820, returning in 1823, when the duke of Angoulême's army replaced Ferdinand on his throne; they were driven out once more by Espartero in 1835, and have had no legal position since. In Portugal, ranging themselves on the side of Don Miguel, they fell with his cause, and were exiled in 1834. Russia, which had been their warmest patron, drove them from St. Petersburg and Moscow in 1813, and from the whole empire in 1820, mainly on the plea of attempted proselytizing in the imperial army. Holland drove them out in 1816, and, by giving them thus a valid excuse for aiding the Belgian revolution of 1830, secured them the strong position they have ever since held in Belgium. They were expelled from Switzerland in 1847–48 for the part they had taken in exciting the war of the Sonderbund. In South Germany, inclusive of Austria and Bavaria, their annals since their restoration have been uneventful; but in North Germany, owing to the footing Frederick II., had given them in Prussia, they became very powerful, especially in the Rhine provinces, and, gradually moulding the younger generation of clergy after the close of the War of Liberation, succeeded in spreading Ultramontane views amongst them, and so leading up to the difficulties with the civil Government which issued in the Falk laws, and their own expulsion by decree of the German parliament, June 19, 1872. In Great Britain, whither they began to straggle over during the revolutionary troubles at the close of the last century, and where, practically unaffected by the clause directed against them in the Emancipation Act of 1829, their chief settlement has been at Stonyhurst in Lancashire, an estate conferred on them by Mr. Weld in 1795, they have been unmolested; but there has been little affinity to the order in the British temperament, and the English province has consequently never risen to numerical or intellectual importance in the society. In Rome itself, its progress after the restoration was at first slow, and it was not till the reign of Leo XII., (1823–29) that it recovered its place as the chief educational body there. It advanced steadily under Gregory XVI., and, though it was at first shunned by Pius IX., it secured his entire confidence after his return from Gaeta in 1849, and obtained from him a special brief erecting the staff of its literary journal, the *Civiltà Cattolica*, into a perpetual college under the general of the Jesuits, for the purpose of teaching and propagating the faith in its pages. How, with this pope's support throughout his long reign, and the gradual filling of nearly all the sees of Latin Christendom with bishops of their own selection, they contrived to stamp out the last remains of independence everywhere, and to crown the Ultramontane triumph with the Vatican decrees, is matter of familiar knowledge.

The society has been ruled by twenty-two generals and four vicars from its foundation to the present day; and the most notable fact to signalize with reference to them is that, of all the various nationalities represented in the company, France, its original cradle, has never given it a head, while Spain, Italy, Holland, Belgium, Germany, and Poland were all represented. The numbers of the society at present are not accurately known, but are estimated at about 6000 in all parts of the world.

The generals of the Jesuits have been as follows:—

1. Inigo de Loyola (Spaniard)	1541–1556
2. Diego Laynez (Spaniard)	1558–1565
3. Francisco Borgia (Spaniard)	1565–1572
4. Eberhard Mercurian (Belgian)	1573–1580
5. Claudio Acquaviva (Neapolitan)	1581–1615
6. Mutio Vitelleschi (Roman)	1615–1645
7. Vincenzio Caraffa (Neapolitan)	1646–1649
8. Francesco Piccolomini (Florentine)	1649–1651
9. Alessandro Gottofredi (Roman)	1652
10. Goswin Nickel (German)	1652–1664
11. Giovanni Paolo Oliva (Genoese) vicar general and coadjutor, 1661; general	1664–1681
12. Charles von Noyelle (Belgian)	1682–1686
13. Tirso Gonzalez (Spaniard)	1687–1705
14. Michele Angelo Tamburini (Modenese)	1706–1730
15. Franz Retz (Bohemian)	1730–1750
16. Ignazio Visconti (Milanese)	1751–1755
17. Alessandro Centurioni (Genoese)	1755–1757
18. Lorenzo Ricci (Florentine)	1758–1775
a. Stanislaus Czerniewicz (Pole), vicar-general	1782–1785
b. Gabriel Lienkiewicz (Pole) vicar-general	1785–1798
c. Franciscus Xavier Kareu (Pole), (general in Russia, 7th March, 1801)	1799–1802
d. Gabriel Gruber (German)	1802–1805
19. Thaddæus Brzozowski (Pole)	1805–1820
20. Aloysio Fortis (Veronese)	1820–1829
21. Johannes Roothaan (Dutchman)	1829–1853
22. Peter Johannes Beckx (Belgian)	1853

The bibliography of Jesuitism is of enormous extent, and it is impracticable to cite more than a few of the most important works. They are as follows: *Institutum Societatis Jesu*, 7 vols., Avignon, 1830–38; Orlandini, *Historia Societatis Jesu*, Antwerp, 1620; *Imago Primi Sæculi Societatis Jesu*, Antwerp, 1640; Nieremberg, *Vida de San Ignacio de Loyola*, 9 vols. fol., Madrid, 1645–1736; Genelli, *Life of St. Ignatius of Loyola*, London, 1872; Backer, *Bibliothèque des Ecrivains de la Compagnie de Jésus*, 7 vols., Paris, 1853–61; Crétineau Joly, *Histoire de la Compagnie de Jésus*, 6 vols., Paris, 1844; Guettée, *Histoires des Jesuites*, 3 vols., Paris, 1858–59; Stewart Rose, *Ignatius Loyola and the Early Jesuits*, London, 1871; Wolff, *Allgemeine Geschichte der Jesuiten*, 4 vols., Zurich, 1789–92; Parkman, *Pioneers of France in the New World*, and *The Jesuits in North America*, Boston, 1868; *Lettres Édifiantes et Curieuses, écrites des Missions Etrangères, avec les Annales de la Propagation de la Foi*, 40 vols., Lyons, 1819–54; Saint-Priest, *Histoire de la Chute des Jésuites au XVIIIe Siècle*, Paris, 1844; Ranke, *Römische Päpste*, 3 vols., Berlin, 1838; and Cartwright, *The Jesuits, their Constitution and Teaching*, London, 1876. (R. F. L.)

JESUS CHRIST.

THE Christian religion, besides its natural and spiritual elements, has also an historical element. It believes that, in accordance with a Divine purpose, prophesied at the very dawn of human life, God was manifest in the flesh in the man Christ Jesus. The actual life of Jesus on earth is but the central part of a scheme which, in the belief of Christians, extends through all the ages. Our present object is merely to furnish a brief sketch of that life as it appears in the full light of history, without entering into the numberless collateral questions which it offers for consideration, a task which in these limits is obviously impossible.

I. The word Jesus is the form assumed in Latin by the Greek *Iesous*, which is the transliterated form of the Hebrew Jehoshua, Jeshua, or Joshua, meaning "Jehovah is salvation." In one or other of its forms the name is found in many passages of the Old Testament. It was not, however, borne by any person who rose to historic eminence between the days of Joshua the son of Nun and the high priest Joshua who was the colleague of Zerubbabel at the return from the exile. The prominent position held by Joshua in the later prophetic books seems to have made the name popular. We find frequent traces of it after the exile.[1] During the Hellenizing period, which excited so deep an indignation among patriotic Jews, many of the bearers of the name preferred to adopt the purely Greek analogon Jason,[2] and the name occurs in this form in the New Testament also.[3] Later on it became one of the commonest Jewish names which we find in the New Testament,[4] and again and again in Josephus.[5] There is some reason for believing that the name of Bar Abbas was also "Jesus," although it may have disappeared from the chief manuscripts, partly from feelings of reverence, partly from the mistaken fancy of Origen that we find no sinner among all those who had borne the name.[6] But the name, though common, was meant to be deeply significant of the work for which Jesus was born into the world—namely, to save his people from their sins; and for this reason, in the account of the Annunciation, as given by St. Luke (i. 31), His mother is expressly bidden to call her babe by this name.[7]

On the other hand, the word Christ was not originally a name but a title.[8] In the Gospels we scarcely ever read of Christ, but always of "*the* Christ."[9] It was only after the resurrection that the title gradually passed into a name, and "Jesus Christ," or later still "Christ Jesus," becomes one designation. The Greek word means "anointed," and is a translation of the Hebrew "Messiah." The coming Deliverer for whom the Jews had yearned for so many centuries was spoken of as the "anointed one," with special reference to the prophecies of Isaiah (lxi. 1) and Daniel (ix. 24–26), which again referred backward to the language of the Psalms (ii. 2, xx. 6, xlv. 7). The anointing of Jesus was the special outpouring of the Holy Spirit upon Him, not only throughout His life (Acts x. 38), but specially at His baptism (John i. 32). Unction was the recognized mode of consecrating any one to the offices of priest (Ex. xxix. 29; Lev. iv. 3) and king (1 Sam. x. 1, xxiv. 6); and prophets were supposed to be anointed by God's grace for the fulfilment of their task (Isa. lxi. 1). The Messiah combined in His office the threefold dignity. He was a prophet to reveal (John vi. 14; Matt. xiii. 57; Luke xiii. 33, xxiv. 19), a king to reign and to judge (Luke xxiii. 2; Acts xvii. 7; 1 Cor. xv. 24; Rev. xv. 3), and a high priest to offer up the sacrifice of Himself (Heb. ii. 17 and *passim*).

---

[1] Jos., *Ant.* xii. 5, 1 and 10, 6, xv. 3, 1; Ecclus., prol., 1. 27, etc.

[2] 1 Macc. viii. 17, xii. 16; 2 Macc. ii. 19, iv. 7; Jos., *Ant.*, xii. 10. 6. The Greek Jason was connected with ἰάομαι, and the Greek fathers by a play on words—of which traces may be found even in the New Testament (Acts ix. 34, x. 38)—connect the name Jesus with the same root (Euseb., *Dem. Evang.*, iv).

[3] Acts xvii. 5, Rom. xvi. 21.

[4] Acts xiii. 6, xvii. 5, xviii. 7; Rom. xvi. 21; Col. iv. 11.

[5] Jos., *Ant.*, xv. 9, 2, xvii. 13, 1, xx. 9, 1; *B. J.*, iii. 9, 7, iv. 3, 9, vi. 5, 5; *Vit.*, 22.

[6] In MS. *S.* the reading is said to be found in "exceedingly ancient MSS." It is now chiefly found in some cursive MSS., and the Armenian and Syriac versions. See Origen on Matt. xxvii. 16.

[7] In Matt. i. 21, the same command is given to Joseph. For the significance of the name see Ecclus. xlvi. 1, where it is said of Joshua that, "according to his name, he was made great for the saving of the elect of God."

[8] "Non proprium nomen est, sed nuncupatio potestatis et regni," Lactant., *Div., Inst.*, iv. 7.

[9] The only exceptions are Matt. i. 1, 18, Mark i. 1, John i. 17 (which are all in the headings and prefaces), and John xvii. 3, where we find "Jesus Christ." The only other passages in which the article is omitted before "Christ" in the Gospels are Mark ix. 41, Luke ii. 11, xxiii. 2, John ix. 22. Thus Matt. ii. 4 is "where *the* Christ should be born;" Matt. xi. 2 is "John hearing in prison the works of *the* Christ," *i.e.*, Messianic works; and Matt. xxii. 42 is "what think ye of *the* Messiah?"

Since these, however, were distinctively Jewish conceptions, it was natural that they should be but little understood by the Greeks and Romans. The word "anointed" conveyed to them no sacred conceptions, and it was restamped (*surfrappé*) by them into accordance with their own notions. They fancied that the real name of the founder of the new religion must be *Chrestus* or "excellent,"[1] and they constantly spoke of the Christians as "Chrestians." Suetonius says that the Jews were expelled from Rome by Claudius because they were raising seditions at the constant instigation of "Chrestus;" and he cared so little to inform himself on the subject that he made no distinction between Jews and Christians, and seems to have imagined that "Chrestus" was some leader of sedition then living at Rome.[2] On the other hand the Christians in nowise objected to the mistaken designation. "If you call us Christians," said Tertullian, "you bear witness to the name of our master; if you call us 'Chrestians,' you testify to the blamelessness of our lives."[3]

II. The designation of "the Christ" given to Jesus shows that His followers saw in him the long-promised Messiah of Judaism; and the rapidity with which the title developed into a name proves the strength and permanence of this conviction. And this much at least is conceded by all, that Jesus more than fulfilled the conditions for which the Jews had hoped in the Deliverer of whom so many prophets had spoken, and that He fulfilled them in a manner transcendently wider, deeper, and more permanent than even the prophets had fully foreseen. Even the most advanced skeptic cannot deny that by His life and teaching He has altered the entire current of human history, and raised the standard of human morality. He was, says Renan, "the individual who had made the species take the greatest step towards the divine."[4] But as His life was passed and His work accomplished, not in a corner,[5] but on the open stage and under the full light of a civilized epoch, it becomes a matter of great importance to estimate the value of the sources from which our knowledge of His life is derived. Those sources are (1) heathen, (2) Jewish, and (3) Christian.

1. The knowledge derivable from heathen sources, if much smaller than we could have desired, or *a priori* expected, is not smaller than is fully accounted for in the simple and unsophisticated narratives preserved for us by the evangelists and apostles. They show us that Christianity began from the most humble origin, and was regarded by the whole non-Christian world—alike Jewish and pagan—with unconcealed hatred, largely mingled with a contempt which ultimately passed into terror and exasperation. They faithfully record for us the obscure position, the extreme poverty, the persecuted lives, the unlearned training of the apostles, and the disdain to which they were on all sides subjected. The silence of contemporary Gentile and Jewish writers, which would be otherwise inexplicable, finds its undesigned explanation in the New Testament itself, which never attempts to conceal the contemptuous indignation of the Jewish aristocracy, and the lordly indifference of the higher Gentile authorities.

Accordingly, from heathen writers we do not learn a single *new* fact respecting Jesus Christ, while yet all that they do tell us, even when expressed in language of calumny and abhorrence, proves the historical reality of the facts which the Gospels record. If it be true that Napoleon once asked Herder whether Jesus ever lived at all, such a passing phase of incredulity is so perfectly unreasonable that it has long been abandoned even by the most destructive critics. Whether there ever existed any authentic census tables of Quirinius, or any official report of Pilate to the emperor Tiberius or not,[6] Tacitus tells us with perfect accuracy that the founder of Christianity had been put to death in the reign of Tiberius by the procurator Pontius Pilate, and that his religion, which Tacitus calls a "deadly superstition," "though crushed for a time, burst forth again, not only throughout Judæa, in which it sprung up, but even in Rome, the common reservoir for all the streams of wickedness and infamy." He further tells us that Nero diverted from himself the odium of the burning of Rome by charging the crime upon the Christians; and, though he implies that their fate was not undeserved because of their universal misanthropy, he yet honestly admits that they were not guilty of this crime of incendiarism, on pretence of which they were subjected to the most awful forms of martyrdom.[7] It is clear that Tacitus, in common with all his contemporaries, confounded the Christians with the Jews, only regarding them as being Jews whose belief was more than usually abject. How little information could be expected from this eminent historian appears from the credulity with which he accepted the most foolish legends and calumnies about the origin and early history even of the Jews.[8] His contemporary Suetonius evidently held the same opinions. He seems to regard Nero as a public benefactor because he punished the Christians, "a class of men of a strange and pestilent superstition."[9] In his life of Claudius, as we have already seen, he ignorantly confuses Christ with some Chrestus whom he supposes to have been at that time living at Rome.[10] From the younger Pliny, who wrote to the emperor Trajan for advice how to deal with Christians,[11] we learn the valuable fact that they lived lives confessedly innocent, since he was unable to establish against them any crime beyond that of the belief which, like his contemporaries, he regarded as a perverse and extravagant superstition. We learn also from this celebrated letter that nothing could shake the allegiance of Christians to Christ, and that they were accustomed to meet early in the morning to celebrate Him as God with hymns of praise. Later in the 2d century the scoffer Lucian, in his *Death of Peregrinus*, and his *Philopseudes*,[12] spoke with bitter sneers both of Christ and Christians. He alludes to the fact of the crucifixion of Christ, to His miracles, to the mutual love and help which prevailed among His followers, and their belief in Him as a divine person. Passing over the asserted allusions to Christ by Numenius,[1] to His parables in Galerius, and to the earthquake at the crucifixion in Phlegon,[2] we come to the "True Word"[3] of Celsus the Platonist, towards the close of the second century. We only know this by the quotations and refutation of Origen, but it furnishes us with indisputable testimony that in his day the facts of the Gospels from first to last were current in the exact form in which we now possess them (see CELSUS). Thus, from the scanty notices of heathens even, we can derive a confirmation of the main external facts in the life of Christ,—His miracles, His parables, His crucifixion, His claim to divine honor, the devotion, innocence, heroic constancy, and mutual affection of His followers, and the progressive victories won by His religion in despite of overwhelming opposition alike physical and intellectual.

---

[1] There is a possible allusion to the similar sound of the two words in 1 Pet. ii. 3, ὅτι χρηστὸς ὁ Κύριος.

[2] The Romans did not fully learn to discriminate Jews from Christians, and to recognize the latter as members of an entirely distinct religion, until the savage attacks upon Christians by the Jewish false Messiah Barcochba, in the reign of Hadrian, 132 A.D.

[3] Χριστιανοὶ γὰρ εἶναι κατηγορούμεθα, τὸ δὲ χρηστὸν μισεῖσθαι οὐ δικαιόν, Just. Mart., *Apol.*, i. 4; Αὐτίκα οἱ εἰς Χριστὸν πεπιστευκότες χρηστοί τε εἰσὶ καὶ λέγονται, Clem. Alex., *Strom.*, ii. 4, § 18. *Christianus* vero . . . . de unctione deducitur, sed et cum perperam *Chrestianus* pronunciatur a vobis (nam nec nominis certa est notitia penes vos) de suavitate et benignitate compositum est." Tert., *Adv. Gentes*, ii., comp. Lactantius, *Div. Inst.*, iv. 7, 5; Jerome on Gal. v. 22

[12] See *Philops.*, §§ 13, 16, which have been thought to imply, ridicule of Christian miracles.

2. From Jewish writers we can glean similar confirmation of the gospel story. Philo indeed is silent. The legends preserved by Eusebius[4]—that Philo had met St. Peter in Rome during his mission to the emperor Caius, and that in his book on the contemplative life he is describing not the life of the Essenes and Therapeutæ, but those of the Christian church in Alexandria founded by St. Mark[5]—are valueless. It is extremely probable that Philo had scarcely heard either of Christ or of the Christians.[6] He died after 40 A.D., but at that period Christianity had hardly emerged into the recognition claimed by prominent historical phenomena. The writings of Philo are valuable, not for any light which they throw on the gospel histories, but for the evidence which they afford of prevalent modes of thought and phraseology, in which some even of the apostles shared. When, however, we turn to Josephus, we find in his writings, as now extant, no less than three allusions to events in the gospel history. It cannot be decided with certainty whether two of these passages are genuine as they now stand, but modern opinion tends to the view that in each of the actual allusions to Jesus there is a genuine basis with later Christian interpolations. The passage in which he speaks of the preaching and execution of John the Baptist is not disputed,[7] and it is very important as showing that Josephus must have been perfectly well acquainted with the facts of Christ's life, and that he has passed them over in his usual unscrupulous way, with a reticence due only to dislike or perplexity. For in speaking of St. John's preaching he deliberately, and it must be feared dishonestly, excludes the Messianic element from which it derived its main power and significance. In another passage he mentions with strong disapproval the judicial murder by the younger Annas of James the Just, "the brother of Jesus, called the Christ."[8] The passage was early tampered with by Christian interpolators who wished to make it a more emphatic testimony in favor of Christ, but in its present form its genuineness is undisputed.[9] Respecting the third passage, in which Josephus speaks directly of Jesus, the only question is whether it be partly or entirely spurious. Placing in brackets the words which are undoubtedly interpolated, it runs as follows:—

> "At this time appeared a certain[10] Jesus, a wise man [if indeed He may be called a man, for He was a worker of miracles, a teacher of such men as receive the truth with joy], and He drew to himself many Jews [and many also of the Greeks. This was the Christ]. And when at the instigation of our chief men Pilate condemned Him to the cross, those who had first loved Him did not fall away. [For He appeared to them alive again on the third day, according as the holy prophets had declared this and countless other marvels of Him.] · To this day the sect of Christians, called after Him, still exists."[11]

That Josephus wrote the whole passage as it now stands no sane critic can believe. Vespasian, not Jesus, was the Messiah of the "ambiguous oracle" of that apostate Jew.[12] There are, however, two reasons which are alone sufficient to prove that the whole passage is spurious,—one that it was unknown to Origen and the earlier fathers, the other that its place in the text is uncertain. It is now found after the historian's notices of Pilate, but the remarks of Eusebius show that in his time it was found before them.[13] We must conclude then that Josephus preserved a politic silence respecting Christ and the Christians, confining himself to remote allusions; and this was quite possible, because he was writing mainly for Greeks and Romans who were profoundly ignorant of the whole subject. That Josephus knew a great deal more than he chose to say is evident. There is reason to suspect that his account of his own juvenile precocity before the leading teachers of his nation is borrowed from the Gospels,[14] and that his account of his shipwreck on the journey to Rome is not uncolored by the facts of St. Paul's shipwreck about that very time.[15] But the most striking indication of his hostile reticence is found in the chapter of his *Antiquities* which follows the supposed allusion to Jesus.[16] He there breaks his narrative in the most arbitrary manner to drag in a disgusting story of a trick played by the priests of Isis on a Roman lady; and no one who is acquainted with the Jewish calumnies about the incarnation can doubt that in this story we have an oblique and malignant anticipation of the falsehood which ultimately took form in the Talmud and the anti-Christian writings of the later Jews.

From other Jewish sources not a single fact about Jesus can be gleaned. In the unexpurgated editions of the Talmud there are about twenty allusions to Christ and the Christians characterized by intense hatred. He is usually spoken of indirectly as "that man," "the Nazarene," "the fool," "Absalom," "the hung," "the son of Stada," "the son of Pandera." Many allusions to him are veiled in cryptographs of which the key is in the possession of but few. All the grossest fictions respecting him—that He was a seducer (*mesîth*) who had learned magic in Egypt, and had been excommunicated by Rabbi Joshua ben Perachia in the reign of Alexander Jannæus (nearly a century before his birth!), and that he was crucified at Lydda, because no one, during forty days, came forward to give any evidence in His favor—are collected in a miserable Jewish tract called the *Toldoth Jeshu*, which may be consigned to oblivion, because even the Jews now regard it with contempt and shame.[17] It is, however, remarkable that from these intensely embittered Jewish sources we derive an absolute confirmation of Christ's stay in Egypt, of His Davidic descent,[18] of His miracles, of His disciples, of His excommunication by the Sanhedrin, of His crucifixion on the evening before the Passover, and even of His innocence,—for not a single crime but that of working miracles by magic, and claiming divine honor, is, even in these sources, laid to his charge. And thus even from pagan and Jewish enemies we derive all that we want and all that we could expect in the recognition of the historic personality of Christ, and of the chief facts in His outward life.

3. If we had nothing to help us but these allusions, the two great facts of Christianity and Christendom

would be an inexplicable enigma. In the Christian sources of information all becomes intelligible. Of these we may dismiss for practical purposes all but the New Testament. From the fathers we derive surprisingly little. A few sayings—of which some are very dubious,[1] and of which the most valuable are only variations of those in the Gospels—and one or two highly uncertain incidents,[2] are all that we can glean from them. The Apocryphal Gospels help us still less. They are for the most part heavy fictions, the inventions of an indiscriminate curiosity, often grossly heretical, abounding in coarsely-conceived and even pernicious miracles, and dwelling chiefly on imaginary details of the nativity, the infancy, or the last scenes.[3] Their chief value is to set forth by contrast the immeasurable superiority of the canonical Gospels, by showing us what these also might have been if they had been the products of human invention. But it is not the Gospels alone on which we have to depend. We have four works of which the authenticity has never even been assailed by any serious writer, namely, St. Paul's four epistles to the Galatians, Romans, and Corinthians. These may truly be regarded as a fifth Gospel, of which the testimony is all the more valuable because it is undesigned and incidental. It is also earlier than that of any Gospel, and is the testimony of one whose personality stands forth with absolute clearness in the light of history. Further than this, it is the testimony of a man of commanding intellect, and of the highest Jewish culture, who, after the death of Christ, was converted from the most bitter hostility to the most intense devotion, and who bears his witness within twenty-five years of the events respecting which he speaks. And yet, if we had the epistles of St. Paul alone, we could find a contemporary testimony to almost every single fact of primary importance in the life of Christ—His birth of the seed of David, His poverty, His Messiahship, His moral teaching, His proclamation of the kingdom of God, His calling of the apostles, His supernatural power, His divine claims, His betrayal, His founding of the Last Supper, His passion, crucifixion, burial, resurrection, and repeated appearances.[4] If we add the testimony of the other epistles, we have further testimonies to almost every fact of importance in the Gospels, as we have also in the catholic epistles and in the Revelation of St. John.

It is, however, from the Gospels that our fullest light is derived. They are not, and do not profess to be, full biographies written for the gratification of curiosity, but they preserve for us all that is necessary to explain the origin of Christianity in the life of its Founder. In the first three Gospels, called Synoptic, we have sketches of the life and teaching of Christ, of which the latest was probably written within forty years of the crucifixion. No one has ever denied that the representation of Christ in these three Gospels is essentially the same. The view of Him presented in the Fourth Gospel, which was not published till towards the close of the 1st century, is more subjective. It is the spiritual Gospel, the Gospel for the church, and even those critics who deny its Johannine authorship admit its value as a very ancient document written by a Jewish Christian of extraordinary genius who had access to the most valuable sources of contemporary information.

III. Since, then, it may be regarded as a truth for which the close investigations of historical criticism have only secured more universal admission that the life of Jesus was a life of which the main outlines are historically certain, we must now glance at its chronology and duration.

It must be admitted that we cannot demonstrate the exact year of the nativity, but critics of all schools are verging more and more towards the acceptance of 4 B. C. as the probable year of Christ's birth. Our present era was fixed (525 A. D.) by a learned Scythian, Dionysius Exiguus, who was an abbot at Rome, and died about 550; but it is now admitted to be erroneous by at least four years. Many methods have been adopted to arrive at the true date; but all attempts to fix it by the enrolment of Quirinius, the order of the Jewish courses of priests, the consulships mentioned by Tertullian, and the extremely remarkable astronomical conjunction of Mars, Jupiter, and Saturn in Pisces in the spring of A. U. C. 748,[5] have led to nothing but highly dubious results. We are left with two data which furnish us with an approximation to the accurate date. One of these is the death of Herod the Great. Josephus tells us that he died thirty-seven years after he had been declared king by the Romans.[6] Now this took place A. U. C. 714, and therefore—by the Jewish mode of reckoning the year from Nisan to Nisan, and counting fractional parts of a year as a whole year—he must have died between 4 B. C. and 3 B. C. Further, we know that there was an eclipse of the moon on March 12, 4 B. C., on which night Herod ordered some Jewish rabbis to be burnt for urging their pupils to destroy his golden eagle,[7] and that he was dead before the passover which took place on April 12, 4 B. C.[8] Christ must therefore have been born before February, 4 B. C. Again, St. Luke tells us that John the Baptist began to preach in the fifteenth year of Tiberius, and as the reign of Tiberius was usually reckoned in the provinces from the date of his association with Augustus in the empire, this gives us A. U. C. 780 for the baptism of John, at which period Jesus was about thirty years old.[9] As to the day and month of the nativity it is certain that they can never be recovered; they were absolutely unknown to the early fathers, and there is scarcely one month in the year which has not been fixed upon as probable by modern critics.[10] The date now observed—December 25—cannot be traced further back than the middle of the 4th century, but was adopted by St. Jerome, St. Augustine, Orosius, and Sulpicius Severus, and in the East by St. Chrysostom and St. Gregory of Nyssa.[11] If 4 B. C. be accepted as the date for the nativity, which has most probability in its favor, the question of the date of the crucifixion depends mainly on that of the duration of the ministry. Now on this point the data of the evangelists have been disturbed by a prevalent early tradition that Christ's public ministry only lasted one year, and by another tradition that Jesus did not die till the age of fifty. The first of these notions is a mistaken inference drawn by Clement of Alexandria,[12] Origen, and other fathers, as also by the Valentinians, from Luke iv. 15; and it was by no means universal even in early days, for Irenæus[13] says that Christ taught for three years. The other notion was a mistaken inference from John viii. 57. That both views are mistakes appears from the positive testimony of St. Luke that Jesus was about thirty years old when he began His ministry, and from the clear indications given by St. John (ii. 13, vi. 4, xi. 55) that there were at least three passovers during the public ministry. On other grounds it is probable that there was one passover during the ministry which our Lord did not attend; and if so, we see the grounds for the ancient tradition that His public preaching lasted upwards of three years, and that Jesus died at the age of thirty-three.[1] He died during the reign of Tiberius, the procuratorship of Pontius Pilate, the tetrarchate of Antipas, and the high priesthood of Joseph Caiaphas. Now Tiberius died on March 16, 37 A. D., and Pilate ceased to be procurator before, and Caiaphas to be high priest immediately after, the passover of 36 A. D.; the date therefore cannot be later than 35 A. D. We may set aside dubious considerations derived from the allusion to an eclipse and earthquake by the pagan historian Phlegon, and may regard it as highly probable that the crucifixion took place at the passover of March 30 A. D.[2]

IV. The circumstances of the nativity are only related by St. Matthew and St. Luke, and by each of them in a manner so absolutely independent that facts known to the one may have been unknown to the other. There is no difficulty in reconciling their fragmentary intimations if we suppose that Nazareth was the native place of Joseph and Mary, and that there the coming nativity was announced to the Virgin, but that the exigencies of the enrolment undertaken by Quirinius for imperial purposes required Joseph to register his name at Bethlehem, the native town of David, from whom both he and, probably, his espoused wife were descended.[3]

Assuming that there was an enrolment of Quirinius in 4 B.C., the difficulties which have been raised about the registration taking place at the home of the family and not at the place of residence are *a priori* objections which have but little weight against testimony. The Jews clung to their genealogies and tribal relations, and in consequence of the settled habits of Oriental life most families would be naturally resident at their native place. The inconvenience to those who were not resident would be but slight in comparison with the danger of exciting tumults by needlessly forcing the Roman methods of registration on a reluctant people. The smallness of Palestine, and the regular custom of attending a yearly passover, would tend to minimize any inconvenience; and, if the attendance of Mary was not obligatory (which is uncertain), nothing is more natural than that at such a time of trial and danger she should have accompanied the only person who could protect her. Those who charge St. Luke with a gross chronological error in antedating by ten years the registration of Quirinius should remember that in *every* other instance in which his statements have been challenged on grounds open to historic decision his accuracy has been triumphantly vindicated.[4] And since the celebrated treatise of A. W. Zumpt (*Das Geburtsjahr Christi*, 1869) it has been all but demonstrated that Quirinius—although the fact is not distinctly mentioned by any ancient author—was twice legate of Syria, viz., A.U.C. 750–753 and again A.U.C. 760–765. Neither the sneers nor the attacks of critics have in the slightest degree shaken this probability; and, since Justin Martyr appeals to the census table of Quirinius, and Tertullian to those of Sentius Saturninus,[5] there is no critical unlikelihood in the conjecture that the census may have been ordered by Sentius Saturninus, begun by Publ. Sulpic. Quirinius during his first term of office as legate of Syria, and completed during his second.

V. It is not of course our object to narrate or even to touch upon all the events and teachings which occupy the four Gospels, but only to glance at their general bearing. The life of Jesus naturally falls into five epochs:—(1) the infancy and childhood; (2) the youth and early manhood; (3) the public ministry, including (4) the closing scenes and crucifixion, and (5) the resurrection and ascension. These epochs are well marked in the Gospels.

1. The two who alone preserve for us any details of the infancy and childhood are St. Matthew and St. Luke, and they relate four events. Of these the circumcision and the presentation in the temple present no difficulties. The circumcision, at which the name was always publicly given, took place on the eighth day after the birth, and was performed in the presence of the nearest friends. It illustrated the truths that Christ was "born under the law" which he came "not to destroy but to fulfil." Thirty-three days after the circumcision was the purification in the temple, and St. Luke tells us how the aged Simeon and Anna welcomed the infant Saviour with words of prophecy. The third event, the visit of the Magi, is known as the Epiphany or manifestation of Christ to the Gentiles.

It rests on the sole authority of St. Matthew, but there is no feature in his account which is out of keeping with known events and possibilities. The Magi, Persian or Chaldæan astrologers, were a class extremely common at that epoch, and under different names are repeatedly mentioned by the contemporary historians and satirists.[6] That they were accustomed to wander to various countries, and to interest themselves in horoscopes, we know from the story of Diogenes Laertius that a Syrian magus had foretold his death to Socrates,[7] and from Seneca's statement that magi, "who then chanced to be at Athens," had visited the tomb of Plato and offered incense to him as to a divine being.[8] That they should have been deeply interested in any sidereal phenomenon is in accordance with what we know of their studies, and that a sidereal phenomenon of the rarest kind,[9] and one which by the recognized rules of astrology was of stupendous significance, actually did occur at this very epoch we know by the independent and, so to speak, accidental investigations of the great Kepler.[10] The conjunction of planets which occurred on December 17, 1613, was followed the next year by the appearance of a new evanescent star of the first magnitude in the foot of Ophiuchus, which first attracted the notice of Kepler's pupil Brunowski, and continued to shine for a whole year. Such a phenomenon may have some bearing on the "star of the wise men," although taken alone it will not minutely correspond with the language of St. Matthew.[11] But that such an astrological event would naturally turn the thoughts of these Chaldæans to some great birth, and that its occurrence in the sign of the zodiac which astrology connected with the fortunes of Judæa should turn their inquiries thitherward, is again in accordance with the tension of Messianic expectations in those days, which especially affected the East, but which has left deep traces even on the pages of Roman writers.[12] Again, the answer of the Jewish rabbis to these inquiries is in exact accordance with their own anticipations.

The sequel of the story—Herod's jealousy and the massacre of the innocents—has been mainly doubted because it is not mentioned in Josephus. But there must have been hundreds of events of that day of which the Jewish historian has taken no notice, though they were far more sanguinary than the murder of a handful of infants in a little village. The act corresponds to the jealousy and cruelty which were the master passions of the Idumæan usurper, and, if Josephus here follows Nicolaus of Damascus, we may be quite sure that he would not have mentioned a fact so damaging to the character of his patron. There are, how ever, two allusions in Josephus, which, if they do not specifically indicate this event, yet may well allude to it, or at least show how consonant it was with Herod's impulses.[1] Further, Macrobius speaks of "the boys under two years of age (comp. Matt. ii. 16) whom Herod ordered to be slain in Syria," and, although he confuses this with the sentence upon Herod's sons of whom Antipater was executed within five days of Herod's death, his words may well point to the murder of the children of Bethlehem.[2] Thus, while this event is not recognizable in other histories, it meets with unexpected confirmations of its possibility from many quarters. That Joseph should have fled with Mary and the child into Egypt was exactly what would have been done by every Jew similarly circumstanced. Three days' journey, as far as the Wady Rhinocolura, would have placed the fugitives beyond the reach of Herod's jurisdiction.

[7] Diog. Laert., ii. 45.

[8] Sen. *Ep.* 58.

[9] The conjunction of the three planets in the same constellation of the same trigon only occurs once in 794 years.

[10] He found that the three planets Jupiter, Mars, and Saturn had been conjoined in Pisces in A.U.C. 748, *De nova stella in pede Serpentarii*, 1606; Ideler, *Chronol.*, ii. 406; Münter, *Stern der Weisen*, 1827; Pfaff, *Das Licht und die Weltgegenden*, 1821.

[11] According to the Chinese Astronomical tables, if Wieseler's account of them (*Chronol.*, p. 61) can be relied on, a new star actually did appear in the heavens at this very epoch.

[12] Virgil, *Ecl.*, ix. 47; Sueton., *Vespas.*, 4; Tac., *Hist.*, v, 13; Jos., *B. J.*, vi. 5, 4.

The sojourn of the holy family in Egypt was probably very short, nor indeed would there have been any temptation to stay a day longer than was necessary. Joseph's first intention was to return to Bethlehem when the news that Herod the Great was dead seemed to open the prospect of happier times. But when he was met on the way by the intelligence that Judea had fallen by his father's will to the share of the cruel Archelaus[3] he was afraid to establish himself so near to the palace of that jealous tyrant, and "retired" (ἀνεχώρησεν) to the mountain seclusion of remote and despised Nazareth. How deep was the impression which these events had made on the memory of the people, and how little likely it was that a contemporary evangelist could fall into a mistake about them, is shown by the fact, which has only recently been noticed, that fully thirty years afterwards Jesus made the events which happened at the succession of Archelaus even in minute particulars the groundwork of a striking parable.[4]

2. At Nazareth He who, even as a mere matter of history, was to influence for ever the entire development of human civilization grew up in extreme seclusion. A single anecdote and two or three incidental expressions comprise every glimpse of Him which we can obtain. We learn that "He was subject to His parents"[5] at Nazareth; that "He grew and waxed strong in spirit, filled with wisdom, and the grace of God was upon him;"[6] that "He gradually advanced (προέκοπτε) in wisdom and stature, and in favor with God and man."[7] We further learn that he was not subjected to the training of any of the rabbinic schools. He had never learned that complicated system of oral tradition which was known by the Jews as "letters."[8] It is doubtful whether the schools which afterwards became common existed at this early period in country villages. Schools for infants are said to have been first founded by the son of Gamaliel, but possibly by this time the custom had begun of employing the scribes and lower officers of the synagogue (*chazzanîm*) to teach the boys of each village. We can trace proofs that Jesus was wonderfully familiar with the sights and sounds of nature, as well as with the habits of men of all classes, for He drew His illustrations in abundance from both sources. It is also certain that He knew both Greek and Aramaic, which were at that time universally spoken throughout Palestine; and there are slight indications that He was acquainted with Latin and with Hebrew, though the latter had now become a dead and learned language. We also find that He was acquainted with the then by no means common art of writing. It is certain that in His home He must, like other Jewish children, have learned first the Shema' (Deut. vi. 4), then the Hallel (Psalms cxiv. to cxviii.), and then the Scriptures generally, to all parts of which, and especially to the Psalms and prophetic books, He constantly referred. The certainty that He never passed through the ordinary training of the learned classes nullifies the suggestion that any part of His wisdom was borrowed from such writers as Philo, and such rabbis as Hillel and Shammai. His methods and His whole moral conception differ fundamentally from those of the Alexandrian philosopher and the Jerusalem Pharisees. His teachers, humanly speaking, were the books of God,—the books of Scripture, of nature, and of life,—and the voice of God within His soul.

At the age of twelve a Jewish boy was held to have finished the elementary stages of his education, and became a "son of the law." At this age He was presented by his father in the synagogue, began to wear the phylacteries, learnt a trade for his own support, and "advanced," as the Jews phrased it, from the study of the Scriptures to that of the oral law. At this age Joseph and Mary took Jesus for the first time to Jerusalem, and there occurred the memorable incident of the temporary loss of Him by His mother and Joseph, and their discovery of Him in the Temple seated among the doctors, "both hearing and asking them questions." His answer to the astonished inquiry, "Why dost thou treat us thus?" was, "Why is it that ye looked for me?" "Did ye not know that I must be in my Father's house?"[9] These are his first recorded words, and their beauty and simplicity give them such a stamp of truthfulness as no art could imitate. They are the first gleam of that character and personality which has transcended anything of which the world has had any experience during all the former or subsequent ages. The evangelists record no further particulars of these early years.

Of the remaining life of Jesus during the period between this visit to Jerusalem and His baptism one word alone remains to us. It is in the question, "Is not this the carpenter?"[10] in Mark vi. 3. It shows us that these eighteen years of youth and opening manhood were spent, not only in the obscurity of a despised provincial village, but also in the manual toils of a humble trade.[11] It shows us that Jesus worked with His hands for His own support, and that of His mother and brethren. The fact is so entirely unlike anything which we should *a priori* have expected in the life of Him whom Christians adore as the Son of God and the Saviour of the world, that we once more see the faithfulness of the narrators, who do not attempt to break by unauthorized inventions the deep silence of those long unknown years in which He consecrated the common lot of toil and poverty, and thereby showed the inherent dignity of manhood and the intrinsic sacredness of human life.

3. Before entering on the third epoch of the life of Jesus,—the baptism and public ministry,—we must pause for a moment to touch on the political and religious aspect of the world during the brief period of His Messianic activity.

Politically the world was passing through a bad epoch. Rome under the emperors, as she attained the zenith of her apparent power and splendor, sank almost to the nadir of her real degradation. The genius of Julius Cæsar, the astute policy of Augustus, could not delay the ever-deepening degeneracy which revealed itself in its worst colors in the reign of Tiberius. The condition of the Roman world during the later years of Tiberius, when he was hiding at Capreæ, the infamies of his sanguinary lust, was that condition of terror and despair which Tacitus has portrayed with such unequalled power. The words in which he describes the characteristics of a somewhat later period apply also to this; it was "rich in disasters, terrible in battles, rent by seditions, savage even in its peace."[1] The murder of princes, the outbreaks of rebellion and civil war, the prevalence of alarming rumors, the decimation of the noblest families by means of spies and informers, the conflagrations of temples and cities, the oppression of provinces by the greed and cruelty of legates and procurators, the horrible degradation of private morals, the awful tragedies of impurity and bloodshed which were enacted in various courts, the multiplications of banishments, even the terror of famines, storms, and earthquakes, combined to render the early years of the Christian era a period of gloom and anguish throughout large portions of the Roman empire. Judæa was the scene of special miseries, because it groaned under the ruthless and hypocritic tyranny of Idumæan usurpers.

---

[1] Jos. *Ant.*, xvi. 11, 7, where he speaks of Pharisees and others massacred for a prediction that Herod's posterity should not enjoy his crown; and xvii. 2, 4, where he speaks of a clamor of "the mothers (comp. Matt. ii. 18) of those who had been slain by him."

[2] Macrob., *Saturnal.*, ii. 4.

[3] St. Matthew uses the word βασιλεύει, and Archelaus, having been saluted "king" by the army, actually did wear that title for a short time after his father's death (Jos. *B. J.*, ii. 1, § 1; *Ant.*, xvii. 9, § 2) until Augustus ordered him to be called only "ethnarch."

[4] The "parable of the pounds." Luke xix. 11–27. St. Luke does not himself allude to the fact that this parable is a veiled sketch of what had happened to the ethnarch thirty years before, and that the circumstance may well have been recalled to the memory alike of the Speaker and the hearers by the vicinity of the splendid palace which Archelaus had built at Jericho (see Jos., *Ant.*, xvii. 13, §§ 1, 2).

[5] Luke ii. 51.

[6] Luke ii. 40.

[7] Luke ii. 52.

[8] Mark vi. 2; John vi. 42, vii. 15.

[9] Luke ii. 49. This and not "about my Father's business" is the correct rendering of ἐν τοῖς τοῦ πατρός μου, as has been conclusively proved in an unpublished paper of Dr. Field. See the present writer's St. Luke (in Cambr. Bibl. for schools) *ad loc.*

[10] This is the true reading, though a false feeling of reverence and a wrong dogmatic bias have led the copyists of the later MSS. to alter it into "the son of the carpenter."

[11] Justin, *C. Tryph.*, 88, says that He specially made "ploughs and yokes."

Meanwhile the religious condition of the world and of the nation was no less unsatisfactory. Throughout the Roman empire the belief in the popular mythology had died away, and, while a few of the noblest spirits took refuge in the hard and despairing dogmas of Stoicism, the mass of the people was plunged in practical atheism or abject superstition. Such religion as there was among the people usually took the form of Egyptian and Phrygian worships, which were often connected with the vilest immorality. In Judæa the dominant religion consisted in scrupulous devotion to the petty external ordinances of the oral law.

Thus at the epoch of Christ's birth the heathen world had sunk into practical atheism, and the Jewish world was deeply corroded by formalism and hypocrisy. In the heathen world religion had almost ceased to exist; in the Jewish world it was tainted at its source.

It was no doubt due to the darkness of the religious and political horizon, and to the sense of despair and weariness which was prevalent in the hearts alike of Jews and Gentiles, that the Messianic hope, fostered by generations of prophets, gained a powerful hold on the hearts of all sincere Israelites, and even found its expression in secular literature. Virgil, Tacitus, and Suetonius, no less than Josephus, show that the thoughts of the civilized world were turned to the East in expectation of some great deliverer. But the character of their hope was utterly mistaken. Overlooking the prophetic passages which told of a suffering Messiah, a servant of Jehovah, who should bear the sorrows of his people, the Jews were anticipating the advent of some temporal sovereign who would rule their enemies with a rod of iron, and dash them in pieces like a potter's vessel, while He raised Israel to the summit of earthly prosperity and luxury.[2] The Messiah, the son of David, was to be a conquering warrior, which accounts for the grossly unspiritual conceptions which induced one party to represent Herod as the promised Messiah, and which enabled Josephus to pretend that he found a fulfilment of the Messianic prophecies in the elevation to the empire of Vespasian, the bourgeois soldier who had crushed his country under the iron heel of the Roman legionaries.

At this time of extreme trouble and expectation the Baptist began his preaching. It was confessedly preparatory. The coming of the Messiah was always declared to depend on the "righteousness" of the nation, that is—in ordinary Jewish phraseology—their rigid observance of the Mosaic law. But John saw that what was needful was morality, not legalism, and his cry, "Repent ye, for the kingdom of heaven is at hand," was explained to each of the great classes which applied to him for advice by practical directions as to their daily duties. John created an intense though transitory impression by his dress and appearance, which recalled the memory of ancient prophets, and specially of Elijah, and still more by the burning sincerity and reality of a style of teaching which presented so strong a contrast to the ordinary teaching of the scribes. He adopted the rigid seclusion and asceticism of the Essenes, and his language rang with denunciations clothed in the imagery of the desert. Refusing all the titles which the people wished to force upon him, he described himself as "a voice of one crying in the wilderness," and announced the coming of one greater than himself, who would found the kingdom which he only announced. The submission to the simple rite of baptism, a rite already familiar to the Jews in the admission of proselytes, was the only sign of the acceptance of his mission which he required; and the multitudes were so deeply moved by his preaching that they thronged to be baptized of him in Jordan, confessing their sins. It was in order to receive this baptism, and to ratify the mission of the great forerunner, that Jesus left the deep provincial seclusion in which He had hitherto lived. The stainless personality of his Kinsman overawed the bold and mighty spirit of the desert preacher. He shrank from baptizing one in whom he at once recognized that "royalty of inward happiness," and purity of sinless life, which he could not himself claim. Jesus, however, though He had no sins to confess, bade John to baptize Him, "for thus it becometh us," He said, "to fulfil all righteousness." He received the baptism, as a representative of the people whom He came to save, as a beautiful symbol of moral purification, and as the fit inauguration of a ministry which came not to destroy the law but to fulfil. And during the baptism John saw the overshadowing radiance and heard the voice from heaven which revealed to him that the promised Messiah had now come, and that this Messiah was the Son of God.

After this great crisis, which finally closed the private period of the life of Jesus, He was "driven" by the spirit into the wilderness for his mysterious temptation. The details of what occurred could of course only have been derived from what He Himself made known to His apostles. What is clear is that in that region of Quarantania, in the desert of Jericho, He was divinely strengthened for this mission by victoriously wrestling with every suggestion of the powers of evil which could have altered the character of His work. Although this was not his only temptation,[3] it was evidently the most deadly. The first temptation appealed subtly and powerfully to the exhaustion of His physical nature; the second to spiritual pride, as it would have been manifested by an unwarranted challenge of the providence of God; the third to unhallowed personal ambition. In the two greatest temptations of His life—in the wilderness and at Gethsemane—He was tempted both positively and negatively,—positively by allurements to a lower line of action, and negatively by the seductive pleas which would have drawn Him aside from the path of suffering. But He won the perfect victory because temptation never passed into even the thought of sin, but was so wrestled with and overcome that it made no determining impression upon His heart.[4]

After this victory over the power of evil, Jesus returned to the fords of Jordan. It will not of course be possible or needful to dwell on the narratives of His ministry in all their details; but, since these narratives are confessedly fragmentary, we shall endeavor to furnish from the four Gospels in rapid outline a sketch of the general events of His ministry before touching upon its eternal significance. The events described in the Gospels are often grouped together by subjective considerations, and it was the evident object of St. John to dwell preponderantly on the Judæan ministry, and on those discourses which brought out the deeper and more mysterious side of the being of Christ, while the Synoptists chiefly describe the work in Galilee, and preserve what may be called the more exoteric discourses. The combination of these disintegrated records into one harmonious and consecutive whole is a task which can never be accomplished with absolute certainty; but it is possible, without a single arbitrary conjecture, to construct a continuous narrative which shall simply follow the indication of our authorities without doing violence to them in any instance. In this scheme the ministry of Christ falls into the following epochs:—(1) the early scenes, narrated by St. John alone, until the beginning of the public preaching in Galilee; (2) the Galilæan ministry till the murder of the Baptist; (3) the period of decided opposition; (4) the period of flight and peril until the final farewell to Galilee; (5) from the great journey to Jerusalem till the retirement to Ephraim; (6) from this retirement to the Passover; (7) the last supper, passion, trial, and crucifixion; (8) the resurrection and ascension.

(1) The scenes of the first period are related by St. John with a beauty and simplicity which can only be called idyllic. He tells us how the Baptist, on the banks of the Jordan, saw Jesus pass by, and exclaimed, in language of deep significance, "Behold the Lamb of God, that taketh away the sin of the world!" Whether the prominent thought in the Baptist's mind was the paschal lamb, or the lamb of morning and evening sacrifice, or the lamb which Isaiah and Jeremiah had used as an emblem of patient and suffering innocence, it is clear that in the spirit of prophecy he saw in Jesus one who was predestined to a life of sorrows which should be for the salvation of the world. The next day the Baptist repeated the same emphatic testimony in the presence of two Galilæan youths, St. Andrew and St. John, who were so deeply impressed by it that they followed Jesus, saw Him in the place where He was then dwelling, and became His first disciples. Andrew then brought to Jesus his brother Simon, who also recognized in Him the promised Messiah. Three days afterwards Jesus called Philip, another young fisherman of Galilee, who in his turn brought to Jesus his friend Nathanael, the guileless Israelite who is known in the Gospels as Bartholomew, or the son of Tholmai. Accompanied by these pure and warmhearted young men, and also by His mother, Jesus was a guest at the simple wedding feast of Cana in Galilee, at which He first displayed His possession of supernatural power by turning the water into wine. Then, after a brief stay at Capernaum, He went to the Passover at Jerusalem. His first visit to the temple as a recognized teacher was signalized by an authoritative Messianic act. He cleansed the temple of its mean and desecrating traffic, although neither priests nor Pharisees nor the Roman authorities had ever taken a step in that direction. When His right to act thus was challenged, He answered in mysterious words, of which the meaning was not thoroughly understood till long afterwards, "Destroy this temple, and in three days I will raise it up"—speaking of the spiritual temple of His body.[1] The words created so deep an impression that after being distorted both in form and meaning they formed one of the chief charges against Him at His trial. Even at this early phase of His work Jesus touched the heart and won the secret allegiance of Nicodemus, with whom He held at night the memorable discourse on the new birth. But He was met from the first by such signs of opposition that He went with His disciples into Judæa, and there allowed them to baptize. The work of the Baptist was not yet over, and, until it was, Jesus both permitted the disciples to adopt the symbol of purification which had been used by His forerunner, and Himself similarly preached "Repent, for the kingdom of heaven is at hand." Some Jew[2] raised a discussion with the disciples of John about purification, and they in their perplexity and jealousy applied to their great master with the complaint that His ministry was being eclipsed by that of Him whom he had baptized beyond Jordan. John, with noble self-suppression, pointed out that he must thenceforth decrease; and shortly after this time he was thrown into prison by Herod Antipas. In consequence of this event Jesus withdrew into Galilee. He chose the route through Samaria, and it was to a poor frail woman by Jacob's well that He seems first to have distinctly revealed His Messiahship. His acceptance of the invitation of the Samaritans to stay a few days with them was a rebuke to the spirit of fanatical hatred and exclusiveness, which in that day so filled the minds of his countrymen that they regarded any intercourse with Samaritans as involving pollution.

(2) Although Jesus was aware that a prophet is often least known in his own country and among his own kindred, He made his way, preaching as He went in various synagogues, direct to Nazareth.[3] There, in the synagogue, He read aloud part of Isaiah lxi., and amid deep silence applied it to Himself. But He had not proceeded far when the spell of His divine teaching was broken by the pride and ignorance of the Nazarenes, who began to murmur among themselves about His humble birth and occupation, and to demand that He should do some deed of power among them. It was on His reminding them that Elijah and Elisha had wrought their miracles of healing upon strangers that they rose in fury, and dragged Him to the brow of the hill on which their city was built. Something, however, in the majesty of His bearing seems to have created in their minds a supernatural awe, so that, as on later occasions, He was able "to pass through the midst of them, and go on His way." To the place of His birth He seems never to have returned.

From this time His home, so far as He could in any sense be said to have a home, was at the bright little city of Capernaum on the shores of the Sea of Galilee, to which, perhaps in consequence of the churlishness of the Nazarenes, His mother and brethren also migrated. At this point begins the period of His brightest activity, the year which was in a pre-eminent sense "the acceptable year of the Lord." The scene of that ministry was mainly the beautiful and populous plain of Gennesaret through which passed "the way of the sea," the great caravan road which led to Damascus. It was the manufacturing district of Palestine, thronged by men of all nationalities, and therefore pre-eminently suited for the proclamation of the kingdom. At the same time it was a scene of infinite charm, and the opportunities of sailing from place to place, and of earning a livelihood, which were afforded by the inland lake, rendered it specially appropriate. On the way to Capernaum Jesus healed by His word the son of the courtier of Herod,[4] who in consequence believed with his whole house. Much of the brief story of the Gospels is made up of the records of single days which stood out with marked prominence. One such day was the first Sabbath at Capernaum. Christ began with a sermon in the synagogue, during which He wrought one of His greatest exorcisms on a raving demoniac who was present in the audience. Retiring to the house of Peter, He healed Peter's mother-in-law of a fever, and at sunset, when the Sabbath ended, wrought many cures upon a multitude of sufferers. The fame of this day rang even to Syria, and, finding that even temporary seclusion was now impossible, Jesus went from village to village preaching the kingdom of God.[1] It was at this time that He preached to the multitude from Peter's boat, and after the miraculous draught of fishes called Andrew, Peter, and the sons of Zebedee[2] to a closer and more unremitting discipleship. Matthew the publican was the next to "leave all" and follow Christ. The choice of the full number of twelve to be apostles took place just before the sermon on the mount, and nothing can more decisively show the wisdom and insight of Jesus than the fact that among the twelve were characters so opposite as a zealot and a publican. Judas, the "man of Kerioth," was probably the only Judæan in the little band of Galilæans. The great discourse known as the Sermon on the Mount was delivered primarily to the disciples, but was intended also for the multitude. The hill by the Galilæan lake[3] was the Sinai of the new dispensation, but it was a mount not of terrors but of beatitudes. The sermon first sketched the character of the citizens of the new kingdom both absolutely and relatively.[4] It proceeded to sketch the new law in contrast, both general and special, with the old.[5] The last great section of it was occupied with the characteristics of the new life—its devotion, its duties, and its dangers.[6] It ended with the contrast between doers and mere hearers.[7] The grandeur, originality, independence, and authoritative tone of the sermon, with its vivid illustrations and divine idealism, produced a very deep and wide impression. The inauguration of the doctrine was followed by deeds of mercy and power. From this time He was constantly surrounded by thronging multitudes, and was constantly appealed to for miracles of compassion. We are told in quick succession of the healing of a leper by a touch, of the centurion's servant by a word, and the raising from the dead of the widow's son at Nain; and so incessant was His activity that His mother and His brethren began to be alarmed. Soon after the miracle at Nain He received the deputation from John the Baptist, then in his gloomy prison at Machærus, to ask whether He were indeed the Messiah. He bade the messengers take back no other answer than the works which they had witnessed or heard, and pre-eminent among them was the preaching the gospel to the poor. It was after their departure that He pronounced the unequalled eulogy on John as the greatest of the prophets, while yet "the least in the kingdom of heaven" was, in spiritual privileges, greater than he. It was in this discourse that He contrasted the glad and natural geniality of His own example—as one who came "eating and drinking"—with the asceticism and gloom of the Baptist. He never refused the invitations even of the Pharisees, and it was at the banquet of a Pharisee named Simon that He accepted the pathetic devotion of the "woman that was a sinner" (whom Christian tradition persistently identifies with Mary of Magdala), and rebuked the haughty and untender formalism of His host. His life during this period, as He wandered about Gennesaret and its vicinity, preaching to rejoicing crowds, was a life of poverty, toil, and simplicity, but it was also a life of exalted joy from the rapturous gratitude of the people and the faith which enabled Him to work many deeds of mercy among them. Of one episode of the period many details are preserved. After one of the missionary tours in Galilee, Jesus, finding Himself surrounded by a vast throng, began for the first time to preach to them in those parables which were the most characteristic form of His subsequent teaching, and which had the additional advantage of testing the moral and spiritual qualities of His hearers. He began with the parable of the sower, and this method of instruction naturally stimulated to such an extent the eagerness of His hearers that He was kept teaching till evening came. A second ill-judged attempt of His mother and brethren to control His proceedings probably combined with the sense of deep weariness to create a desire for brief rest and retirement, and He urged His disciples to a hasty departure to the lonelier eastern shores of the lake. During the sail of about 6 miles there rose one of the violent sudden storms to which the Sea of Galilee is specially liable. He was sleeping on the leather cushion of the steersman the deep sleep of fatigue, which not even the waves now dashing into the boat could disturb. The disciples woke Him in wild alarm, and the calm majesty with which He hushed the storm made an indelible impression on their minds. No sooner had they landed on the other side than they were met by a naked and raving maniac, whose dwelling was in the tombs which are still visible on the neighboring hillsides. Jesus healed him, and (as we are told in a narrative which evidently touches on things entirely beyond our cognizance) suffered the demons to enter into a herd of swine hard by, which immediately rushed violently over a steep place into the sea. The semi-heathen inhabitants of the district, alarmed by His presence, and vexed at the loss of their swine, entreated Him to depart out of their coasts. He granted their evil petition, but left the healed demoniac to lead them to a better frame of mind. The people on the other side recognized the sail of His returning vessel, and were waiting in multitudes to meet Him. While preaching to them in a house at Capernaum, the friends of a paralytic, who had been unable to get near Him for the press, let down the sick man through the roof in front of Him, and He healed him, exciting some murmurs from the Scribes, who had already begun to watch Him with suspicion, by first using the formula "Thy sins are forgiven thee." From the house He adjourned to the shore, and after another brief time of teaching there went to the farewell feast which Matthew gave to the "publicans and sinners" who had been his friends. The Pharisees, afraid as yet to find fault with Him directly, asked the disciples in great displeasure why their Master ate with publicans and sinners, whose very touch they regarded as a pollution. The answer of Jesus was given in the memorable quotation, to which He more than once referred, "Go ye and learn what that meaneth, I will have mercy and not sacrifice."[8] He answered the inquiry of St. John's disciples about fasting by pointing out to them that the glad initiation of the marriage feast of the kingdom of heaven was no time for fasting,[9] and that the embodiment of a new spirit in old form was like putting new wine in worn skins, or a new patch on an old garment. It seems to have been immediately after the banquet that He received the heartrending appeal of Jairus that He would come and heal his little daughter. On the way He healed the woman with the issue who secretly touched the fringe of His garment.[10] By the time He reached the house of Jairus the little maid was dead, and His three most chosen disciples—Peter, James, and John—were alone admitted with the father and mother to witness this second instance in which He recalled the dead to life.

---

[1] John ii. 19. That "the Jews," as St. John calls the opponents of Christ, were not so entirely ignorant of His meaning as they chose to appear results from Matt. xxvii. 63.

[2] Μετὰ Ἰουδαίου is the true reading in John iii. 25.

[3] Luke iv. 15.

[4] Not improbably Chuza, Herod's steward, whose wife Joanna was one of the "ministering women."

It was probably at this point of the ministry that there occurred the visit to that unnamed feast at Jerusalem,[1] which was almost certainly the Feast of Purim. Perhaps with a view to this absence from Galilee He sent out the twelve, two and two, to preach and perform works of mercy in His name, sending them "like lambs among wolves," and bidding them set the example of the most absolute contentment and simplicity. During His visit to Jerusalem, where—as we learn from St. John, whose facts are incidentally confirmed by allusions in the Synoptists—He had many friends and followers, He healed the impotent man at the Pool of Bethesda, and excited the bitter enmity of the Jews by deliberately ignoring the exaggerated minutiæ of the traditional law which made them regard it as a heinous crime to carry even the smallest burden on the Sabbath. The simple command to the healed man to take up the mat on which he lay and walk aroused the Jews to fury; and from that incident, as St. John expressly tells us, the overt persecution of Jesus began.[2] He seems to have been summoned before some committee of the Sanhedrin, but on this occasion they did not dare to punish His violation of their traditions, and on the contrary had to listen in unavailing wrath, not only to His irresistible defence of what He had done on the Sabbath, but to Divine claims which they declared to be blasphemy. They did not dare to touch Him, knowing His power with the people, but from that day the leading authorities of Jerusalem seem to have determined on His death, and their hostility was so bitter and persistent that He left Jerusalem without waiting for the approaching Passover.

---

[1] Three such circuits in Galilee are faintly traceable; but it is not possible to mark their separate incidents.

[2] They were probably first cousins of Jesus, for it seems probable from Mark xv. 40, John xix. 25, that Salome the wife of Zebedee was a sister of the Virgin Mary.

[3] Probably Karn Hattín.

[4] Matt. v. 1–16.

[5] Matt. v. 17–48.

[6] Matt. vi. 1 to vii. 23.

[7] Matt. vii. 24–27.

[8] Hos. vi. 6.

[9] His reference to the days "when the bridegroom should be taken away from them" (ἀπαρθῇ) is one of those early intimations of His death of which one hint had already been given in the night discourse to Nicodemus (John iii. 16).

[10] An interesting indication that he observed even the minute particulars of the Mosaic law (Numb. xv. 37-40; Deut. xxii. 12).

(3) It was from this moment that the period of determined opposition began. Hitherto the local Pharisees and Scribes of Galilee might disapprove and murmur, but they had not dared to set themselves in distinct and public antagonism against Him. They were now encouraged to do so by the fact that the leading authorities of the capital had repudiated His claims. The high priests and Pharisees even sent some of their number to act as spies upon His words and actions, and see how they might contrive occasions for His ruin. He returned to Galilee with the full knowledge that His human day was beginning to fade into evening, and that the sentence of violent death hung over Him. It was at this solemn time that the murder of John thrilled men's hearts with horror. Jesus retired with the disciples to a desert plain near the town at the northern end of the lake known as Bethsaida Julias, which was in the dominion of the milder Philip, and beyond the jurisdiction of the blood-stained Antipas. Even to this retirement, however, the multitude followed him, and here it was that, moved with deep compassion, He fed the five thousand with five barley loaves and two small fishes. Then urging the departure of His disciples by boat to Capernaum, He dismissed the multitude in the gathering dusk, and at last fled from thence[3] to the top of a neighboring hill where He spent the night in prayer. During the night a terrible storm arose, and He came to His disciples walking upon the sea, and rescued St. Peter as with a half faith he endeavored to meet Him on the water. The next day at Capernaum He uttered that memorable discourse about Himself as the bread of life, and the necessity of "eating the flesh of the Son of Man and drinking His blood," which was expressly designed to dissipate idle chiliastic and material delusions, and to test the sincerity of a spiritual faith. The discourse created deep discontent, and from that time many forsook Him. He even foresaw that one of His chosen apostles was "a devil;" but Peter spoke the conviction of the rest in the noble words, "Lord, to whom shall we go? Thou hast the words of eternal life."

But henceforth opposition became more marked and more fearless. It had already been stirred up in the hearts of all Jewish formalists by His claiming to forgive sins, by His disapproval of asceticism, by His intercourse with publicans and sinners. It gathered force from His consistent depreciation of the petty traditional superstitions which had degraded the Sabbath from a delight and a blessing into a mere fetish of servitude. When the incident at Bethesda had attracted the notice of the Sanhedrin, the Pharisaic spies from Jerusalem especially watched His Sabbath proceedings. Again and again their hatred was kindled on this point. Now they indignantly challenged the conduct of the hungry disciples for plucking ears of corn and rubbing them in their hands on the Sabbath day; on another occasion they attacked Him for healing on the Sabbath day the man with the withered hand, and later on for healing the bowed woman, and the blind man at Jerusalem. On each of these occasions He exposed with irresistible demonstration their inconsistency and hypocrisy, but thereby only deepened their anger against Him. On other occasions He came into violent collision with their whole system of traditional ceremonialism by pouring contempt on their superfluous and meaningless ablutions, by showing how comparatively meaningless was their scrupulosity about clean and unclean meats, and generally by denouncing the spirit which had led them to place the cumbrous pettinesses of their oral law above the word of God and the inmost spirit of all true religion. The rage of His Pharisaic opponents culminated on one day of open and final rupture between Himself and the spies of the Sanhedrin. Finding Him standing in silent prayer, the disciples had asked Him to teach them to pray, and in reply He had taught them "the Lord's prayer," and told them, in such accents as man had never heard before, about the fatherhood of God, and the consequent efficacy of prayer. Shortly afterwards He had wrought one of His most marvellous cures upon a poor wretch who was at once blind, dumb, and mad. The Pharisees felt bound to check the astonished admiration which this act had once more excited, and with impotent and stupid malignity had tried to teach their followers that He cast out devils by Beelzebub the prince of the devils. This blasphemous folly had drawn down upon their heads words of rebuke more intense and stern than they had ever heard. Such words, addressed to men accustomed to unbounded admiration as infallible teachers, aroused them to the deadliest hostility, and they soon found a weapon of annoyance and injury by demanding on every possible occasion that "sign from heaven" which Jesus always refused to give. Their exacerbation seems to have alarmed His mother and brethren into the third of their ill-timed interferences, which Jesus had once more to check by declaring that the day had now come on which human relationships were as nothing compared to the spiritual. The time for the mid-day meal had now arrived, and Jesus accepted, though it seems to have been given in no good spirit, the invitation of a Pharisee to break bread in his house. On entering He at once sat down at table, since it was but a brief and trivial meal, perhaps of bread and fruits, and the multitude were waiting outside to hear the word of God. Instantly He recognized that He was alone in the midst of enemies, and, moved to deep indignation by their hypocrisy and baseness, He delivered a terrible denunciation of the whole system and religion of the legalists and Pharisees. The feast broke up in confusion, and the guests began to surround Jesus with vehement, taunting, and threatening demonstrations.[4] Passing from amongst them He found the multitude actually treading on each other in their haste and eagerness, and perhaps it was to their presence that He owed His safety. He preached to them a sermon, characterized throughout by the deep emotions by which His spirit had been agitated, of which the main topic was the awful peril of hypocrisy and greed; and then

---

[1] John v. 1.

[2] John v. 16.

[3] ℵ (Vulg.) φεύγει, John vi. 22.

[4] Luke xi. 53.

—as though some solemn agony had passed over His spirit—He warned them of the signs of the times, and of the awful consequences of rejecting His teaching.

(4) With that day of conflict ended the second and darker stage of His work in Galilee. The remainder of His life was mainly passed in flight, in peril, and in concealment, only broken by brief occasional appearances in Galilee and Jerusalem. He departed from Capernaum, and went into the heathen region of Tyre and Sidon. But few particulars of this period are recorded. Somewhere in those regions He tested the strong faith of the Syro-phœnician woman, and healed her demoniac daughter. From Tyre and Sidon He wandered southwards again, keeping mainly to the eastward and less inhabited region, only now and then healing a sufferer, but gradually attracting crowds once more. Somewhere on the Peræan side of the lake He fed the four thousand. After this period of wandering and absence He once more sailed to Magdala, but was met immediately by the ominous conjunction of Herodians and Pharisees with their hostile demand for a sign. Turning away from them, He uttered His last sad farewell and prophecy to the cities in which He had labored, and once more journeyed northwards. During this journey they came near to Cæsarea Philippi, and, after standing in silent prayer, He asked His disciples, "Whom do men say that I the Son of man am?" The sorrowful confession had to be made that, though they recognized Him as a prophet, they had not recognized Him as the Messiah. Then came the momentous question, which was to test how much of His task was accomplished in the hearts of those apostles whose training had now for some time been His principal work, "But whom say ye that I am?" Then it was that Peter won the immortal glory of giving that which has thenceforth been the answer of all the Christian world, "Thou art the Christ, the son of the living God." That answer is the inauguration, in human convictions, of Christianity and of Christendom; and it was rewarded by the promise of the power of the keys, and the power to bind and loose, and the foundation of the Christian church upon a rock. Whatever may be the difficulties of the passage, we see that Jesus meant to confer on His church the teaching power of which the key was the symbol, the power of legislative action indicated by binding and loosing, and the prophetic insight on which depended the ability to absolve in God's name. But to obviate all delusions He at once revealed to them the dark abyss of suffering down which He had first to tread; and, as though to prove how little claim His words gave to sacerdotal usurpations, He proceeded to rebuke in the sternest words the presumption of Peter, who ventured to set aside His predictions as to His coming sufferings and death. It was six days after this that He took the three most chosen apostles with Him up the snowy slopes of Hermon, where they witnessed the transfiguration, as though to strengthen their faith in the dark hours to come. On descending the hill, He healed the demoniac boy whom the apostles had vainly tried to help, and built on this exorcism the lesson of faith which He was never weary of inculcating on his followers. Having now reached the northern limit of the Holy Land, He turned His footsteps southwards by the most secluded paths, omitting no opportunity to train the apostles, now teaching them humility by the example of a little child, and now warning them by significant parables of the need of self-sacrifice and of the spirit of forgiveness.

(5) At the ensuing Feast of Tabernacles we find Him once more at Jerusalem, where He appeared suddenly in the temple. St. John records His teachings, drawn from the various incidents of the feast, and also the divided opinions of the people, and the almost unanimous opposition of the ruling classes. This visit to the Holy City was marked by the incident of the woman taken in adultery, in which He showed such sovereign wisdom and tenderness, and by the Sabbatarian disputes which arose from the healing of the blind man. On one occasion Jesus had to leave the temple amid a burst of fury in which the Jews threatened to stone Him, and when He left Jerusalem it was under the direct ban of excommunication. Under these circumstances He returned for one more brief visit to Galilee. The news which he received of the murder of some Galilæans in the temple by Pilate, and of Herod's designs against His safety, show how surrounded by perils was His human life. But He now calmly ended His work in Galilee by the mission of seventy disciples to prepare for His great last journey southwards. His words of farewell to the cities which had rejected Him were full of sadness and solemnity, as He started from the land which had refused His mission to the city in which He was to be crucified.

We now enter on the last great phase of His work, the incidents of His final journey and the close of His ministry. First He was refused shelter by the rude villagers of Engannim, and had to change his route. Next came the healing of the ten lepers, of whom but one showed gratitude, and he was a Samaritan. The Sabbath healings of the bowed woman and of the man with the dropsy are the two chief miracles of the journey, during which He also delivered many most memorable discourses, and some of His divinest parables—such as those of the good Samaritan and the prodigal son. So we trace His steps to the house of Martha and Mary at Bethany, and to Jerusalem, which He visited at the Feast of the Dedication. His appearance in the temple was always the signal for the fiercest opposition of Sadducees and Pharisees, who watched with jealousy and hatred the eagerness of the multitude to hear Him. After serious conflicts He retired to the other Bethany, beyond Jordan. Among the few recorded incidents of His stay in Peræa are the attempts to entangle Him with Herod and the Jewish schools by questions about divorce, the beautiful scene of blessing the little children, and the discourse about riches on the occasion of the test which He applied to the rich young ruler who "made the great refusal." The death of Lazarus summoned Him to Bethany, and the most signal miracle which He there wrought by raising Lazarus from the dead excited such notice that the Sanhedrin now met under the presidency of Caiaphas, and came to the deliberate conclusion that they must put Him to death, lest the populace should raise tumults on His behalf which might precipitate the final intervention of Rome in the affairs of their nation. But, as His time was not yet come, Jesus avoided the peril of public arrest or private assassination by retiring to an obscure village called Ephraim, on the edge of the wilderness.

(6) He did not leave Ephraim till He could join the great caravan of Galilæan pilgrims with whom He could proceed in safety to His last passover. His apostles, both from His own warnings and from the visible grandeur of His transfiguration of self-sacrifice, were well aware that a crisis of His career had now arrived; and nothing can show more clearly the mistaken character of their Messianic hopes than the fact that, though He now distinctly told them the crowning horror that He should be crucified, the sons of Zebedee came with their mother Salome to beg for places at His right hand and His left in His kingdom. Jesus made their ambitious request a theme for rich and solemn teachings on the beatitude of suffering for the cause of God and man. As they approached Jericho, accompanied by excited multitudes, He healed the blind Bartimæus, and in Jericho He excited the murmurs of the crowd by accepting the hospitality of the publican Zacchæus. On the road between Jericho and Bethany He delivered the parable of the pounds. He arrived at Bethany probably on Friday, Nisan 8, A.U.C. 783 (March 31, 30 A.D.), six days before the passover, and before the sunset had begun the Sabbath

hours. The Sabbath was spent in quiet. In the evening Martha and Mary gave him a banquet in the house of Simon the leper, at which Mary, in her devotion and gratitude, broke the alabaster of precious ointment over His head and feet, and so awoke the deadly avarice of Judas that he seems on that very evening to have communed with the Jewish priests for the paltry blood-money of thirty pieces of silver (less than £4) for which he was willing to betray Him. On the morning of Palm Sunday Jesus made His triumphant entry into Jerusalem amid the palm-waving throngs, who shouted "Hosanna to the son of David," and at the point of the road where the city first bursts upon the view He paused to weep over it and prophesy its doom. After once more cleansing the temple, and protecting from the anger of the priests and Pharisees the children who still shouted Hosanna, He spoke to Philip about the Greeks (probably from Edessa) who wished to see Him, and, strengthened by a voice from heaven, spent the rest of the day in teaching. At evening He retired for safety with the twelve outside the city walls in the direction of Bethany. On the Monday morning, as He went to Jerusalem, He pronounced the symbolic doom upon the fig-tree which had only leaves. On entering the temple He was met by a formidable deputation of priests, scribes, and rabbis, who demanded "by what authority He was acting,"—a question which He declined to answer until they proved their right to ask it, by giving a definite opinion respecting the baptism of John. Their confession of inability to do this was so marked a proof of their incompetence to claim the function of religious teachers, that he refused to meet their challenge. The day may be called "a day of parables," for during His teaching He spoke the parables of the two sons, the rebellious husbandmen, the builders and the corner stone, and the marriage of the king's son. These parables were so obviously aimed at the hypocrisy, malevolence, and presumption of the Jewish authorities that fear alone restrained them from immediately seizing Him. At evening he again retired from the city. The next day, the Tuesday in Passion week, may be called the day of temptations, for it was marked by three deliberate attempts to undermine His authority by involving Him in some difficulty either with the rulers or the people. In the morning walk to Jerusalem He taught to His disciples a lesson of faith from the withered fig-tree. In the temple He was first met by the plot of the Herodians and Pharisees to embroil Him either with the Romans or the populace by a question as to the lawfulness of paying tribute, then by a piece of poor casuistry on the part of the Sadducees concerning the resurrection, then by the question of a Scribe as to the great commandment of the law. In each instance the divine and ready wisdom of His answers not only entirely defeated the stratagems of the Sanhedrists, but showed his immeasurable superiority to them in knowledge and insight. Then, to prove how easily He might have turned the tables on them, had He desired their humiliation, He exposed their complete ignorance respecting the very subject on which they claimed the fullest knowledge by reducing them to a confession of their inability to explain why David in the spirit had given the name of Lord to the Messiah who was to be his son. And then, knowing that the time had come when their degradation of religion into a mere tyranny and semblance should be set forth, He delivered the terrible denunciation which, with its eightfold "Woe unto you, Scribes and Pharisees, hypocrites," was intended to leave them utterly inexcusable. The Jewish authorities felt that this was a final rupture, that they must now, at all costs, bring about His immediate death.

Before He left the temple forever He taught the lesson of true charity as illustrated by the widow's mite, and then went and sat on the green slopes of the Mount of Olives. There He pronounced to His disciples that great eschatological discourse which was suggested by their admiration of the temple buildings, destined so soon to sink in blood and ashes. In the cool of evening they walked to Bethany, perhaps at the very time that Judas was arranging with the priests the final details of His betrayal and arrest. The Wednesday was spent in deep retirement at Bethany, and not a single word or incident is recorded on that day. On the Thursday morning He woke never to sleep again.

(7) On the evening of Thursday Jesus went with His disciples to Jerusalem to keep that quasi-paschal feast at which He instituted the sacrament of the Eucharist. Even then the apostles had jealousies about precedence, and it was to cure them of their fatal tendency to selfish pride and ambition that He washed the disciples' feet. During the supper He first indicated to John, and through him to Peter, that He knew who the traitor was. He clearly told them that this was the last meal which He should eat with them, and bade them henceforth "eat bread and drink wine" in sacramental memory of Him. It was after Judas had gone forth into the night that He began those last discourses preserved for us by St. John alone, which are so "rarely mixed of sadness and joys, and studded with mysteries as with emeralds." There is a matchless beauty and tenderness in the records of His gentle words of warning and help to Peter, Thomas, Philip, and Jude, and of that familiar intercourse with his dearest followers, whose sinking spirits He sustained by the promise of the Comforter. Then they sang a hymn, probably the Psalm known to the Jews as the Great Hallel, and in the darkness walked to the olive garden of Gethsemane, where Jesus passed through His hour of mysterious agony and passion, while even His most beloved apostles could not watch with Him. Then torches suddenly flashed upon the night as the traitor, accompanied by priests and their servants, and Levites of the temple guard, and Roman soldiers, made their way across the valley of the Kidron to the slope of Olivet on which the garden lay. There Judas betrayed Him with a kiss; and, in spite of the supernatural awe which His presence inspired even into His enemies, He resigned Himself into their hands, rebuked the rash blow of Peter, and by one last act of mercy healed the slight wound of Malchus. "Then all His disciples forsook Him and fled."

(*a*) He was taken first to the astute and aged Annas, who was regarded as high priest *de jure* though not *de facto*. From this time forward it was the priestly party —the Sadducees, not the Pharisees—who were almost exclusively responsible for His death. On His refusal to plead before this disorderly midnight tribunal, He was struck on the mouth; and, failing to extort anything from Him, Annas sent Him bound across the courtyard to his son-in-law Caiaphas, the *de facto* high priest.

(β) It was still night, and here took place the second irregular and illegal trial, before His worst enemies among the priests and Sadducees. The false witnesses who endeavored to convict Him of having threatened to destroy the temple failed, and He preserved unbroken silence until Caiaphas adjured him by the living God to tell them whether He was the Messiah, the Son of God. In answer to this appeal He said "I am," and told them that they should see His return hereafter in the clouds. Then Caiaphas rent his robes with the cry of blasphemy, and this committee of the Sanhedrin declared Him "guilty of death."

(γ) After this second examination Jesus was remanded to the guardroom until break of day, before which time the whole Sanhedrin could not meet. As He was led past the brazier in the courtyard, His one glance broke into penitence the heart of His backsliding apostle, who had just denied Him with oaths. As He waited, He was insulted by the coarse derision and brutal violence of the priestly menials. When the Sanhedrin met, they once more entirely failed to fix any charge upon Him, until He renewed in their presence His claim to be the Son of God. He was then formally condemned to death, and underwent a second derision at the hands of the assembled elders. It was after this condemnation that remorse seized the dark soul of Judas. He flung down the blood-money before his tempters, and with an agonized confession of guilt rushed out to his terrible suicide.

At this period the Jews had lost all legal right to put any one to death, and they were further anxious to avoid personal responsibility, and danger of vengeance from the followers of Jesus, by handing Him over for execution to the Roman procurator. Accordingly they led Him bound to Pilate in imposing procession. They were, however, mistaken in supposing that Pilate would crucify Jesus at their bare word without seeing whether He was guilty; and, as they could not enter the Herodian palace, in which the Gentile ruler lived, without pollution, which would have prevented them from partaking in the passover that evening, Pilate went out to them. In every line of the brief colloquy which ensued we trace the haughty contempt of the Roman, and the burning hatred of the Jews. Failing to arrive at any definite charge, Pilate questioned Jesus alone inside the prætorium, and after a brief examination came out to the Jews with the declaration of complete acquittal.

In the wild clamor which ensued he caught the word Galilee, and understanding that Jesus had chiefly taught in Galilee, eagerly seized the opportunity of getting rid of the matter by sending Him to Herod. But before Herod as before Pilate Jesus retained His majestic silence, and, unable to condemn Him, Herod contented himself with arraying Him in a white festive robe, setting Him at nought with his myrmidons, and sending Him back with a second practical acquittal to the procurator.

Then, in three stages, began the third and most agonizing phase of the public trial. Pilate, seated on his bema upon the marble pavement, declared that, as His innocence was now certain, He would merely scourge and dismiss Him. It was a disgraceful proposal, due partly to his desire to save the life of one whom he saw to be innocent, but dictated by fear of a new riot. Further than this, the warning of his wife, and the awful majesty of the sufferer, had created a strong presentiment in Pilate's mind. But his actions were practically controlled by the past guilt which made him tremble at the thought of the complaints which Jews, Samaritans, and Galilæans could alike prefer against him. He did not therefore venture to refuse the cry of the mob—hounded on as they were by the priests and Sandhedrists—for the passover boon of having a prisoner liberated to them; and he vainly tried to induce them to ask for the liberation of Jesus. They demanded the rebel and murderer Bar Abbas, and began to shout for the crucifixion of Jesus. Bar Abbas was set free, and Jesus underwent the horrible Roman scourging, which was followed by the ruthless mockery of the soldiers, who arrayed Him in an old crimson robe and placed a crown of thorns on His head, and a reed in his hand as a sceptre, and so paid Him mock homage as a king of the Jews.

When He came forth after this hour of agony, Pilate made one more appeal to their compassion in the words "Behold the man!" and on hearing that he claimed to be "a Son of God"—for since the charge of treason had broken down, the priests now substituted for it a charge of blasphemy—he became still more alarmed, and once more questioned Jesus in a private interview. For some time Jesus would not speak. When He did, it was to say that He regarded Pilate as less guilty than the Jews. As Pilate led Him forth, and saw Him stand before that shameful yelling multitude in His majesty of solemn woe, he broke forth into the involuntary exclamation, "Behold your King!" That word raised among the multitude some very ominous allusions to Cæsar, and Pilate, after publicly washing his hands, in token that He was innocent of this death, pronounced the fatal order for His crucifixion.

Jesus was then clad in His own garments and led forth with two robbers to be crucified. As He was unable to bear the weight of His cross, Simon of Cyrene was impressed for that service. On His way Jesus gently consoled the weeping daughters of Jerusalem, and, when they reached the fatal spot of Golgotha, He refused the stupefying potion which was offered to Him, and prayed for His murderers even as they drove the nails through His hands. Pilate managed to insult the Jews by putting over the cross the title "The King of the Jews," in three languages, which thus in the presence of the vast passover multitude testified to the truth. On the cross Jesus hung for three hours in agony. The soldiers parted His garments, and cast lots for His seamless robe. The mob, the priests, even the crucified malefactors, joined in taunting Him. But He answered not. After His prayer for His murderers He only spoke to promise paradise to the penitent robber; to assign His mother to the care of the beloved disciple; to quote in the lowest depth of His agony the first words of the 22d Psalm; to give vent to the sole expression of physical anguish which He uttered, "I thirst"; to commend His spirit into His father's hands; and lastly, in the one victorious word Τετέλεσται, "it is finished," to end His work on earth. The bearing of Jesus on the cross, together with the circumstances which accompanied the crucifixion—the darkness, earthquake, and rending of the temple veil—produced a deep impression even on the mind of the heathen centurion. They so powerfully affected the multitude that they returned to Jerusalem wailing and beating on their breasts, at once with a feeling of guilt and a presentiment of future retribution.

(8) At evening the soldiers despatched the two crucified robbers by breaking their legs, in order that their bodies might be removed before the passover. But they found Jesus already dead, and the certainty of His death was assured by one of the soldiers driving his spear into the region of the heart, whence came out blood and water. As very little time was left before the sunset marked the beginning of the Sabbath, and rendered labor impossible, the body of Jesus was hastily buried by Nicodemus and by Joseph of Arimathæa, who had obtained the requisite permission. They wrapped it in fine linen and spices, and laid it in the rock-hewn garden-grave of Joseph, rolling a great stone to the aperture, which was further guarded by soldiers sent by the Jews to prevent its removal for purposes of fraud. This was on Friday evening. Very early on the morning of Sunday, while it was yet dark, the two Marys were met at the sepulchre by a vision of angels which announced His resurrection. Of that resurrection, in spite of their original doubts and misgivings, the whole body of the disciples became unalterably convinced, and on their unalterable conviction, and the subsequent witness of history to the blessed truth of their doctrines, has rested in great measure the belief of the Christian church. Uniting the contemporary testimony of St. Paul, who must have been in personal communication with many of the five hundred witnesses to whose evidence he appeals, with those of the Gospels, we find ten recorded appearances:—(1) to Mary Magdalene (John xx. 17); (2) to other women (Matt. xxviii. 9, 10); (3) to Peter (Luke xxiv. 34; 1 Cor. xv. 5); (4) to the two disciples on their way to Emmaus (Luke xxiv. 13-32); (5) to the ten apostles. All these appearances occurred on the first Easter day. On the following Sunday Jesus appeared (6) to the eleven apostles, Thomas having been absent on the previous occasion. He further appeared (7) to seven apostles by the Sea of Galilee (John xxi. 1-24); (8) to more than five hundred at once on a mountain in Galilee; (9) to James (1 Cor. xv. 3, 8); and (10) at the ascension. These appearances continued for forty days.

On the last occasion Jesus led His disciples towards Bethany, gave them His last command, blessed them, and as He blessed them passed away, and "a cloud received Him out of their sight."

VI. Such, in briefest outline, are the main recorded events of the life of Jesus Christ on earth. It only remains to say a few words concerning His person and His work, regarded here in their historical rather than in their theological aspect.

As regards His person, Christians who accept the New Testament as the record of inspired teaching, and who believe it to be evidenced, not only by inward and supernatural revelation, but also by the subsequent history of the church and the world, believe that Jesus Christ was (in the words of what is probably a very ancient Christian hymn quoted by St. Paul) the only begotten Son of God, "manifest in the flesh, justified by the Spirit, seen of angels, preached unto the Gentiles, believed on in the world, received up into glory";[1] and as a part of this belief they hold that, just as Adam the first man was not born but created, so the second Adam, who came to redeem our nature, was not born by ordinary generation but was "incarnate by the Holy Ghost of the Virgin Mary." But even those who do not accept this faith see in Jesus a unique and sinless personality, one with whom no other human being can even distantly be compared, either in His character, His teaching, or the results which He accomplished by His brief ministry. He taught but for three years, and not continuously even during them. He accepted the most ordinary customs of the teachers of His day. He wore no broad phylacteries like the Pharisees; He was not emaciated with asceticism like the Essenes; He preached the kingdom of God, not, as John had done, between the gloomy precipices of the wilderness, but from the homely platform of the synagogue, to give the Midrash when the Torah had been read.[2] He appeared before the people, not in the hairy mantle of a prophet, but "in the ordinary dress of a Jewish man, at the four ends of which the customary tassels were not wanting."[3] He came "eating and drinking"; He had no human learning; His rank was but that of a village carpenter; He checked all political excitement; He directed that respect should be paid to all the recognized rulers, whether heathen or Jewish, and even to the religious teachers of the nation; He was obedient to the Mosaic law; His followers were "unlearned and ignorant men" chosen from the humblest of the people. Yet He has, as a simple matter of fact, altered the whole current of the stream of history; He closed all the history of the past, and inaugurated all the history of the future, and all the most brilliant and civilized nations of the world worship Him as God. Kant testifies to His ideal perfection.[4] Hegel saw in Him the union of the human and the divine. Even the most advanced of sceptics do Him homage. Spinoza spoke of Him as the truest symbol of heavenly wisdom. The beauty and grandeur of His life overawed even the flippant soul of Voltaire.[5] "Between Him and whoever else in the world," said Napoleon I. at St. Helena, "there is no possible term of comparison."[6] "If the life and death of Socrates are those of a sage," said Rousseau, "the life and death of Jesus are those of a God."[7] "He is," says Strauss, "the highest object we can possibly imagine with respect to religion, the Being without whose presence in the mind perfect piety is impossible."[8] "The Christ of the Gospels," says Renan, "is the most beautiful incarnation of God in the most beautiful of forms. His beauty is eternal; His reign will never end."[9] John Stuart Mill spoke of Him as "a man charged with a special, express, and unique commission from God to lead mankind to truth and virtue."[10]

The transcendent power of His personality, which is betokened in such expressions as those quoted above, is due, not only to His devotion and self-sacrifice, but to His absolute sinlessness. This constitutes the unique character of His individuality. He alone of mankind has claimed to be sinless, and has had the claim granted by unanimous consent both in His lifetime and in subsequent ages. He alone among men has never even been assailed by the breath of moral calumny, and never even in His most sacred utterances and prayers betrayed the faintest consciousness of any evil as present in His soul. He therefore alone has furnished mankind with a perfect ideal; and, though no saint has ever even distantly attained to the perfectness of that ideal, yet those who have done so in greatest measure have always said that they have done so solely by the aid of His grace, and the imitation of His example.

Nor was His teaching less unique than His personality. It was marked by a tone of sovereign authority; "Ye have heard that it was said—but I say unto you." In this it was the very opposite to the teaching of His own day and of centuries afterwards, which relied exclusively upon precedent. It was also marked by absolute originality. The test of its originality is the world's acceptance of it as specifically His. Isolated fragments of it may be compared with truths uttered by others; but it stands alone in its breadth and in its power, in its absence of narrow exclusiveness and scholastic system and abstract speculation. It was fresh, simple, natural, abounding in illustrations at once the most beautiful and the most intelligible, drawn from all the common sights and sounds of nature, and all the daily incidents and objects of social and domestic life. It flowed forth without reserve to all and on every fitting occasion,—on the road, on the hillside, on the lake, or by the lonely well, or at the banquet whether of the Pharisee or the publican. Expressed in the form of parables, it has seized the imagination of mankind with a force and tenacity which is not distantly approached even by the sacred writers, and even when not directly parabolic, it was so full of picturesqueness and directness that there is not one recorded sentence of it which has not been treasured up in the memory of mankind. His utterances not only rival and surpass all that preceded and all that has followed them, but "they complement all beginnings." Sometimes they consist of short suggestive sayings (gnomes), full of depth, yet free from all affectation or obscurity,[11] which make even what is most mysterious and spiritual humanly perceptible, throwing over it the glamor both of poetry and of a longing presentiment, and incessantly enticing man towards something yet higher. There is never in them a lurking fallacy nor a superfluous word, but all is "vivacity, nature, intelligibility, directly enlightening grace," intended only to convince and to save. And while such was the incomparable form of his teaching, its force was even more remarkable. It is all centered in the two great truths of the Fatherhood of God and the brotherhood of man; from the former springs every truth of theology, from the latter every application of morals. Judaism had sunk into a religion of hatreds; the one message of Jesus was love. In this He differs even from John the Baptist and the prophets. "Their emblem is the storms, His the sun."

Once more,—as regards the work of Jesus, the Christian believer contemplates it in that aspect in which it is presented by St. Paul as a work of atonement, the redemption of a guilty race,[1] but even apart from this the mere historical student must admit that Christ elevated both the individual and the race as none have ever done before or since. His doctrine purified the world from the loathly degradation of lust and luxury into which society had fallen. By convincing men of the inherent dignity of manhood, He added to the value of human life. He made holiness a common possession. Heathen morality had reached its loftiest point in the stoic philosophy; but Stoicism was scornful, ineffectual, despairing, and Christ gave a moral system infinitely more perfect, more hopeful, and more tender to all mankind. To him is alone due the Christian significance of such words as charity, humility, and humanity. He first taught the sacredness of the body as a temple of the Holy Ghost. He has inspired the aims of the noblest culture, while at the same time He has restored the souls of men, and made the care of the moral and spiritual being the supreme end of life. The gradual emancipation of the world from the tyrannies of sensuality, cruelty, and serfdom has been won step after step from His principles. The supremacy of the spiritual, the solidarity of nations, the universality of God's love, the essential equality of all men in His sight are but a few of the great and fruitful conceptions which have sprung directly from His teaching, and which still have an unexhausted force, to bring about, in ever-increasing measure, the amelioration of the world.

VII. It only remains to touch on the growth and progress of Christian doctrine relative to the Person of Christ. It would have been impossible for the Christian world to have drawn from the teaching of the apostles and evangelists any other conclusion respecting Jesus than that He was more than man,—that He was "God manifest in the flesh." The Gospels spoke of His incarnation, His sinlessness, His miraculous power, His claims far loftier than would have been possible to simple man, his fearless conjunction of His own name with that of the Eternal Creator. Alike the Gospels and the Epistles testify to His pre-existence (John i. 15, vi. 52, viii. 58), His eternal existence (1 Pet. iii. 18–20; Phil. ii. 6, 7; Rev. i. 11), His part in the creation of the world (Heb. i. 11), His miracles of power; and they speak of Him in terms incompatible with simple humanity.[2] It is indisputable that no Christian, who accepted as divine revelations the writings of St. John and of St. Paul, could possibly suppose that the Saviour, in whom he was taught to trust, and into whose name he was baptized, was a mere human being like himself. And yet, that Jesus was perfectly *human*, as well as divine, they could not for a single moment doubt. He was born of a woman. He grew like other children. He suffered hunger, and thirst, and weariness, and pain, and wounds and death. He had flesh and bones like all other men, and passed through the stages of life as others do. And His soul was a human soul no less than His body was a human body, for He increased gradually in wisdom no less than in stature; and felt sorrow and sympathy, and was subject to temptation, and was liable to the common emotions of our mortal nature.

With these facts the earliest teachers of the church were content. When they had asserted that Christ was both human and divine, "born and unborn, God in flesh, life in death, born of Mary and born of God" (Iren., *Ep. ad Ephes.*, 7), they entered into no speculations respecting the mode and definition of that union of natures. But such reticence soon became impossible. The doctrine of a God-man was openly assailed or secretly undermined by twofold forms of heresy—partly by Jewish Ebionites, partly by Gentile Docetæ. The Ebionites, the Nazarenes, the followers of Artemon, the Alogi, and many sects allied to them in their main principle, denied the true divinity of Christ. In the opposite direction many of the Gnostic sects entirely explained away His humanity, either with the Basilidians supposing that He only became divine at His baptism, or holding with the Valentinians that Mary was only the channel by which He entered the world. To both these conflicting fancies the orthodox fathers opposed the simple statement of St. John that "the Logos became flesh." But, as was natural, their opinions were as yet vague and even in some instances erroneous. Thus Justin Martyr thought that in Christ the Logos took the place of the human intelligence (*Apol. min.*, ch. x.). Clement of Alexandria thought that the human needs and sufferings were only apparent, or by way of "accommodation" (*Pæd.*, i. 5, p. 112; *Strom.*, vi. 9, p. 775, ed. Sylb.). Origen had clearer views, and was the first to use the term God-man (θεάνθρωπος), as well as to guard against the double error of excluding the Logos from Christ, or of confounding the Logos with the existence of the human Christ (*Hom. in Ezek.* iii. 3; *C. Cels.*, iii. 29). It is, however, important to observe that the existence of technical errors of theology in the modes of expressing this doctrine adopted by the Ante-Nicene fathers was freely admitted, and was not regarded as formal heresy. Their individual insight was not sufficient to enable them to arrive at those careful scholastic definitions to which the church was only guided by the collective wisdom of œcumenical councils after periods of long and painful conflict. The remarks of St. Jerome on the real orthodoxy of the early fathers are both charitable and explicit. "It may be," he says, "that they erred in simplicity, and that they wrote in another sense, or that their writings were gradually corrupted by unskilful transcribers; and, certainly, before Arius, like 'the destruction that wasteth at noonday,' was born in Alexandria, they made statements incautiously which are open to the misinterpretations of the perverse." We find a remarkable illustration of the extent to which the terminology was as yet unsettled in the fact that the council at Antioch which condemned Paul of Samosata in 269 also condemned the expression *homoousios* ("consubstantial"), which a century afterwards became the very watchword of Nicene orthodoxy.[3]

By the 3d century the Ebionizing heresies were practically dead, but the Docetic were still flourishing in various forms. Two sects had arisen; one was that of the Patripassians, who so completely obliterated all real distinction between the first and second person of the Trinity as to lay themselves open to the charge of teaching that the Supreme Father had been crucified. Thus Praxeas taught that the same God is at once the Father and Son. Noetus of Smyrna, when banished from Ephesus, taught these notions at Rome, and even the Popes Zephyrinus and Callistus seem to have been imbued with them. Sabellius, a presbyter of Ptolemais, elaborated these opinions into a system in which Father, Son, and Holy Spirit were only three modes of manifestation, three *names*, three *aspects* of the divine monad revealing itself under three different forms (Greg. Nyss., *Orat. c. Arian. et Sabell.*). The Monarchians, on the other hand, in their equal anxiety to avoid all danger of Ditheism and Tritheism, admitted the supernatural birth of Christ, but only saw in Him the holiest of the prophets; these views were expounded at Rome by Theodotus of Byzantium, who was consequently expelled from the church by Pope Victor. The heresies of Paul of Samosata, the vain and brilliant patriarch of Antioch, seem to have originated in an unhappy attempt to reconcile the views of these Monarchian sects by teaching that not the whole divine substance was manifested in Christ, but only one single divine power. He thus distinguished between the Logos and the human Son of God. He was banished, and died in obscurity, but the sect, which was generally called Patripassian in the West and Sabellian in the East, continued to linger on for a time.

All these controversies were but preludes to the great struggle of the church against Arianism. Hitherto she had condemned the Noetians and Sabellians for denying the hypostasis of the Son as distinct from the Father, and the Theodotians and Ebionites for denying His divinity. Arius, a presbyter of Alexandria, admitted both the divine and the human nature of Christ, but by making Him subordinate to God denied His divinity in its highest sense. He was led to this error by the reaction against Sabellianism, and he ranked the Son among created beings, saying that "there was (a time) when He was not." Arius was deposed and excommunicated by a council at Alexandria, but since many bishops, and among them the distinguished Eusebius of Cæsarea, and Eusebius of Nicomedia, interceded in his favor, the dispute assumed such wide proportions that Constantine was compelled to intervene by summoning in 325 the first œcumenical council of Nice. By this council the doctrine of Arius was condemned, and it was declared to be a matter of the Catholic faith that the Son was not only of *like* essence (*homoiousios*) but of the *same* essence (*homoousios*) with the Father.

It was long, however, before the voice of controversy was silenced. Many bishops still continued to be on the one hand Arian or Semi-Arian, while on the other hand men of great power and enlightenment, like Marcellus of Ancyra and Photinus of Sirmium, slid back into dangerous affinity to Sabellianism. It was in consequence of a similar reaction that Apollinaris, bishop of Laodicea, in the desire to maintain the glory of Christ, fell into a new heresy and revived an old error, by arguing that in Jesus the Logos supplied the place of the reasonable soul. It is obvious that such a view undermined the doctrine of the example and atonement of Christ, and it was condemned in 381 at the council of Constantinople.

---

[3] Mansi, i. 1001; Euseb., *H. E.*, vii. 27-30; Epiphan., *Hær.*, lxv. 1.

The next great controversy arose from the refusal of Nestorius, patriarch of Constantinople, to apply to the Virgin Mary the term *Theotokos* or mother of God. In his endeavor to avoid the extremes which had already been condemned, he spoke of the union of the two natures in Christ as a connection (*συνάφεια*) or indwelling (*ἐνοίκησις*), but denied that there was any communication of attributes (*κοινωνία ἰδιωμάτων*). He maintained, in fact, a mechanical rather than a supernatural union of the two natures. He was condemned in the council of Ephesus, 431, and died in exile; but the schools of Edessa and Nisibis still maintained the Nestorian doctrine, which has continued in the East even till the present day.

The last great controversy on the two natures was raised by Eutyches, archimandrite of Constantinople, who confounded together the two natures which Nestorius had separated, thus inaugurating what is known as the Monophysite heresy, which was condemned in the council of Chalcedon, 451. It is needless to explain the obscure heresies of Theopaschites, Phthartolatri, Aphthartodocetæ, or to do more than name the views of the Monothelites, who strove to put an end to controversy by maintaining that though there were two *natures* in Christ, there was only one *will*. The main results at which the church arrived cannot be better summed up than they are in an admirable passage of Hooker (*Eccl. Pol.*, v. 54, 10): "There are but four things which concur to make complete the whole state of our Lord Jesus Christ. His deity, His manhood, the conjunction of both, and the distinction of the one from the other being joined in one. Four principal heresies there are which have in those things withstood the truth: Arians by bending themselves against the deity of Christ; Apollinarians by maiming and misinterpreting that which belongeth to His human nature; Nestorians by rending Christ asunder and dividing Him into two persons; the followers of Eutyches by confounding in His person those natures which they could distinguish. Against these there have been four most ancient general councils: the council of Nice to define against Arians; against Apollinarians the council of Constantinople; the council of Ephesus against Nestorians; against Eutychians the Chalcedon council. In four words *ἀληθῶς*, *τελέως*, *ἀδιαιρέτως*, *ἀσυγχύτως*, *truly*, *perfectly*, *indivisibly*, *distinctly*—the first applied to His being God, the second to His being man, the third to His being of both One, and the fourth to His still continuing of that one Both—we may fully, by way of abridgment, comprise whatever antiquity hath at large handled either in declaration of Christian belief, or in refutation of the foresaid heresies." The result of these centuries of controversy was enshrined in the so-called Nicene creed—"the holy symbol declared at Nice, established at Constantinople, strengthened at Ephesus, sealed at Chalcedon."

When the church had thus rigidly defined the limits of Catholic orthodoxy, the decisions of the four œcumenical councils were accepted, and no further controversies rose on these subjects for about 800 years. The disputes between the Nominalists and the Realists, and the speculations of the Schoolmen generally as regards this subject, turned rather on the proofs or illustrations of the doctrine of the Trinity than on theories respecting the two natures of Christ. There are remarks and illustrations not only in the Schoolmen but even in the Reformers which might be regarded as questionable, but none of them were intended to diverge from the Catholic verity. Passing over the crude system of Servetus, we hear of Unitarian communities in Poland as early as 1563. In 1544 Lælius Socinus had been obliged to leave Italy because his opinions were known to be unfavorable to the divinity of Christ. On his death at Zurich in 1562 his nephew Faustus Socinus openly taught the opinions which he had learnt from his uncle's papers, and acquired a considerable following in Poland. The exegetic methods of Socinianism were so weak, and its rupture with Christian history so absolute, that the special views of the Socini—which were that Christ, though miraculously born, was only the highest of men, and was deified after His death as a reward for His virtue—have had an indirect rather than a direct influence. In 1611 three men were burnt in England for denying the doctrine of the Trinity, but in the middle of the 17th century we find John Biddle recognized as a leader of the Unitarians, and the spread of Unitarian doctrines led Bull to write his celebrated *Defensio Fidei Nicenæ* in 1685. The first Unitarian church in England was founded in 1773 by Lindsay. The writings of Spinoza and of the English deists—Herbert, Toland, Shaftesbury, Chubb, Bolingbroke—helped largely to weaken the orthodox faith. But in later periods it has been rather undermined than denied. While nominally accepted, it has been understood and explained in a manner of which the ancient church never so much as dreamt. Kant used all the traditional formulæ, but they do not appear to have been more to him than symbolic expressions. Similarly Schelling spoke of the Three Persons of the creeds as three *Momentums*, for which he substituted in later years the word *Potenzen*, and the language of Fichte and Hegel practically sublimates to nothing the doctrine of Christ's divinity.

But this "dispersive analysis" of the later centuries has shown itself most markedly in some of the Lives of Jesus, and these prove very conclusively that many Christians have not preserved the Nicene faith, but find an insuperable stumbling block in the miracles. Even in the treatment of the life of Jesus by Hess (1768) there is a spirit of concession to modern doubt which becomes still more marked in the similar sketches of Herder (1796), who leans, wherever he can, to the natural or the symbolic view of miracles. The *Leben Jesu* of Paulus was written with the avowed object of explaining away the supernatural elements in the Gospels while yet the evangelists themselves were accepted as faithful witnesses,—an attempt which at once fell to the ground under the weight of its own absurdity. Far different was the line adopted by Schleiermacher in his *Lectures on the Life of Jesus* (published from notes by Rütenik in 1864). Schleiermacher wished to steer between the Ebionitic and the Docetic views of Christ, but while maintaining the divinity, he systematically endeavors to reduce the miracles within the scope of natural laws, and treats even the resurrection in a rationalizing manner, as though Jesus had not really died. Hase, in his *Leben Jesu* (1829), leans in the same direction, supposing that Jesus possessed some unknown power and a sort of sanative magnetism. None of these writers have, however, produced so deep an impression as Strauss and Renan. Strauss, instead of endeavoring to eliminate the supernatural, or to invest it in some sort with a natural appearance, treated the Gospel narratives as myths from which it was hardly possible to understand the historic personality of Christ. In his *Leben Jesu* (1835) he rejected the Fourth Gospel altogether; in his second edition, in deference to Neander, he left the question neutral. In this earlier phase he regarded Jesus as merely "the idea of the identity of God and man, and the mission of humanity" built up on Messianic prophecy; but he afterwards, as in his *Life of Christ for the People* (1864), attached more importance to the tendency-theory of Baur, and in his later writings (*The Old Faith and the New*, 1873) treated the existence of Christianity in as disdainful a tone as though it were hardly worthy of any explanation at all. Renan (*Vie de Jésus*, 1863) entirely abandoned all faith in Christ's divinity, and, while speaking of Him as one "whom His death had made divine," treated Him from the point of view of an amiable rabbi who, beginning as an innocent enthusiast, developed into something hardly if at all removed from conscious imposture. Meanwhile these negations had provoked a strong reaction; and writers like Neander (1837), Ebrard (1842), Lange (1843), Olshausen (1853), Weisse (1856), Riggenbach (1858), and above all Ewald (1855), maintained with abundant learning the truth of the Gospel narratives, though the works of all of them betray, in a greater or less degree, the signs, to which Neander so touchingly alludes, that they were produced "in an age of crisis, of isolation, of pain, and of throes." The most important recent contribution to the literature of this subject is the *Jesu von Nazara* of Keim (1867). He writes in a reverent spirit and a powerful style, with abundant learning and patient research. He takes his stand on the sinlessness of Jesus, and presents Him as human indeed but still divine in the exaltation of His humanity. Keim attributes the Fourth Gospel to a late and post-apostolic author, and when he gives it as his conclusion that "in the life of Jesus, where the most genuine and unadulterated humanity dwelt, was revealed at the same time not only a religious genius, but the miracle of God and His presence upon earth," and that "the person itself and nothing else is the miracle," he shows by how vast a space modern opinion has receded from the views of the Catholic church. The English works on the *Life of Christ* have been very numerous of late years, and have been marked with few exceptions by their fidelity to Christian faith.

Literature—The bibliography of the life of Christ is immense, and the monographs on isolated questions which bear upon it may be counted by hundreds. The reader will find a fairly adequate account of the results of a comprehensive critical survey of the whole field in Hase's *Geschichte Jesu*, 1875. So far as the patristic and mediæval periods are concerned, the gospel-harmonies of Tatian, Ammonius of Alexandria, Victor of Capua, Gerson, and the poetical compositions based upon the Gospel narratives by Prudentius, Sedulius, Nonnus, Cædmon, the author of the *Heliand*, Otfried of Weissenburg, and others, may be dismissed with a mere reference. Of greater importance as early examples of a large class of works, designed for religious edification rather than for historical portraiture, are the *Vita Christi* of Bonaventura (first printed in 1480, and often since, the latest English translation bearing so recent a date as 1880), and the *Vita Jesu Christi* of Ludolphus Saxo (written about the middle of the 14th century, and first printed at Strasburg in 1470). After the Reformation the harmony of the Gospels continued to absorb much of the attention of scholars, and many able works in this field, from that of Osiander (1537) to that of Bengel (1736), appeared, all of them, however, unnaturally restricted by the limitations of a conventional orthodoxy, and marked by a characteristic absence of the critical spirit. The only work belonging to this early period which can be said still to possess permanent value is the *Life of Christ* by Jeremy Taylor, 1653. Such works as the *Messiah* of Klopstock, 1748, belong to literary rather than to theological history. The beginnings of a new historical method can be traced in the writings of the English deists, such as Woolston and Chubb, a method which somewhat later was taken up by Reimarus and Lessing, and gave rise on the other side to the apologetic works of Lardner, Paley, and others in England, and in Germany to those of Herder (*Vom Erlöser des Menschen, oder unsere drei ersten Evangelien*, and *Von Gottes Sohn der Welt Heiland nach Johannes*) and of Hess (*Geschichte der drei letzten Lebensjahre Jesu*, 1768; 7th ed., 1823, with the title *Lebensgeschichte Jesu*). In chronological order, the names of Schleiermacher and Hase come next. The lectures of the former, first delivered in Berlin in 1819, and frequently repeated in subsequent years, had almost expended their great influence before their publication by Rütenik (*Vorlesungen über das Leben Jesu*, 1864); those of the latter, begun at Tübingen in 1823-4, first saw the light as a *Leben Jesu* in 1829 (5th ed., 1865, and in a still more expanded form entitled *Geschichte Jesu* in 1875). Their publication was preceded and occasioned by that of the *Leben Jesu als Grundlage einer reinen Geschichte des Urchristenthums* of Paulus in 1828. A new phase of negative criticism was introduced by the publication in 1835 of the *Leben Jesu* of Strauss, further developments of which are to be found in his *Leben Jesu für das deutsche Volk bearbeitet* (1865; Eng. transl., 1865), and in the writings of his followers, among whom may be mentioned C. H. Weisse (*Das Leben Jesu kritisch u. philosophisch bearbeitet*, 1838), Salvator (*Jésus Christ et sa doctrine*, 1838), and Gfrörer (*Geschichte des Urchristenthums*, 1838). Among the very numerous works controverting these in the interests of Christian apologetics, the most important are those of Tholuck (*Die Glaubwürdigkeit der Evangelischen Geschichte*, 1837), Neander (*Das Leben Jesu Christi*, 1837; 7th ed., 1873; Eng. transl., 1848), Ebrard (*Wissenschaftliche Kritik der Evangelischen Geschichte*, 1842), Wieseler (*Chronologische Synopse der vier Evangelien*, 1843), Lange (*Leben Jesu*, 1844–47; Eng. transl, 1864, 1871), from the Protestant standpoint; and those of Kuhn (*Leben Jesu*, vol. i., 1838), Sepp (*Leben Christi*, 1843), and Bucher (*Das Leben Jesu Christi*, 1859), from the Catholic. The writings of the Tübingen school (Bruno Bauer, *Kritik der Evangelischen Geschichte des Johannes*, 1840; *Krit. d. Ev. Gesch. der Synoptiker*, 1841; *Krit. d. Ev. Gesch. der Synopt. u. d. Johannes*, 1842; *Krit. der Evangelien u. Gesch. ihr. Ursprungs*, 1850; F. C. Baur, *Krit. Untersuchungen ü. d. Kanon. Evangelien*, 1847; *Das Christenthum u. d. Christliche Kirche der drei ersten Jahrhunderte*, 1853) on the other hand occasioned Ewald's *Geschichte Christus u. seiner Zeit* (1855), and the similar works of Lichtenstein (*Lebensgeschichte Jesu Christi in chronol. Uebersicht*, 1856), Riggenbach (*Vorlesungen u. d. Leben d. H. Jesu*, 1858), Baumgarten (*Die Geschichte Jesu*, 1859), Ellicott (*Historical Lectures on the Life of our Lord Jesus Christ*, 1860). Renan's *Vie de Jésus* appeared in 1863, Schenkel's *Characterbild Jesu* in 1864 (compare the *Christusbild der Apostel u. der nachapostolischen Zeit* of the same author, 1878), Keim's *Der Geschichtliche Christus* in 1865, his *Jesu von Nazara* in 1867–72, Hausrath's "Die Zeit Jesu" in the *NT'liche Zeitgeschichte* in 1870, Wittichen's *Leben Jesu* in 1876, and Volkmar's *Jesus Nazarenus n. d. Schriftzeugen d. 1ten Jhdts.*, p. i., in 1881. With these may be contrasted, amongst many others which might be named, the following well-known works:—Pressensé, *Jésus Christ, son temps, sa vie, son œuvre*, 1865; Weizsäcker, *Untersuchungen ü. d. Evangelische Geschichte*, 1864; Gess, *Christi Person u. Werk*, 1870–79; Dupanloup, *Hist. de Notre Seigneur Jesus Christ*, 1870; Andrews, *Life of our Lord upon Earth*, 1863: F. W. Farrar, *Life of Christ*, 1874, 23d ed., 1881; Geikie, *Life and Words of Christ*, 1877. *Ecce Homo, a survey of the life and work of Christ*, an anonymous work, which attracted much attention in its time, is also worthy of mention here. From Catholic sources we have the second volume of Bougaud's *Le Christianisme et les temps présents*, entitled *Jésus Christ*, 1871; also Grimm's *Leben Jesu nach den vier Evangelien*, of which as yet only two volumes have appeared, 1876–78. On Christology the standard work is Dorner's *Darstellung der Lehre von der Person Christi*, 1845–56; Eng. trans., 1862. (F. W. F.)

JESUS, THE SON OF SIRACH (Sirachides), the author of the book of Ecclesiasticus, was a native of Jerusalem, of whose personal life, apart from this one fact, vouched for by himself (Ecclus. l. 27), nothing is known, except that it was devoted to the study of the sacred literature. According to indications contained in chaps. xxxiv. 11, 12, xxxix. 4, 5, li. 1 *sq.*, he seems to have travelled abroad, associated with princes, and once at least been placed in danger of his life by intrigues against him at a royal court. His collection of moral sayings (σοφία Ἰησοῦ υἱοῦ Σιράχ, LXX.; *Ecclesiasticus*, sc. *Liber*, Vulg.), originally written in Hebrew, and bearing according to Jerome the title of "Proverbs," was translated into Greek by his grandson, who came to Egypt in the thirty-eighth year of Ptolemy Euergetes (see the Prologue). By this Ptolemy Euergetes we can only understand the second of that name, who began to reign as king of Libya and Cyrene in 170 B.C. Reckoning two generations back from 132 B.C. we reach the high priesthood of Simon II. (219–199 B.C.), to whom, and not to Simon I., the eulogy spoken in Ecclus. l. is most probably to be assigned. The book was thus originally composed about 180 B.C.

JET, a mineral substance belonging to the carbonaceous group, and generally regarded as a compact variety of lignite, or wood-coal, impregnated with bitumen. The word *jet* (German *Gagat*) is corrupted from *gagates*, the name applied to it, or to a similar substance, by Greek and Roman writers, and derived, according to Pliny (*H. N.*, xxxvi. 34), from the river Gagas in Lycia, where the mineral was originally found. Its occurrence in Britain is mentioned by Solinus; but it was certainly used there in pre-Roman times. Barrows of the Bronze Age have yielded beads, buttons, rings, armlets, and other personal ornaments of jet. The early supply was probably obtained from the Yorkshire coast, near Whitby—a locality which still yields the finest varieties. The Whitby jet occurs in isolated masses, of irregular shape, but frequently more or less lenticular, imbedded in bituminous shales near the base of the Upper Lias. The particular horizon of the jet-rock is known to geologists as the zone of *Ammonites serpentinus*. Opinion is divided as to the exact nature and origin of the jet: some regard it as a variety of lignite, others as a kind of cannel coal, and others again as a hardened form of bitumen. There is little doubt that the jet has in all cases resulted from the decay of organic matter. Microscopic sections of jet frequently reveal a ligneous structure, in most cases of coniferous type. It has been suggested that masses of wood brought down by a river have drifted out to sea, where, becoming water-logged, they have sunk and have gradually been covered with a deposit of fine black mud, beneath which the decay has slowly proceeded. Possibly bituminous matter may have been distilled from this decaying vegetation, and deposited between the layers of shale in its neighborhood. Drops of liquid bitumen are frequently found in the fossils of the jet-rock, and inflammable gas, derived from the bituminous shales, is not uncommon in the jet-mines. Moreover, scales of fish and other fossils of the jet-rock are frequently converted into jet, the bituminous matter having replaced the original tissues. When jet is heated, it betrays its bituminous character by burning with a dense pungent smoke, which was formerly reputed to possess powerful medicinal virtues. At present the material is used only for trivial ornaments, principally for mourning jewelry. To obtain jet, the shale is systematically mined not only at its outcrop in the cliffs but in the inland dales of the Cleveland district. It is now rare to find washed jet upon the seashore, but formerly a considerable quantity was thus obtained. The best hard jet is exceedingly tough, and may be readily carved or turned on the lathe, while its compact texture allows it to receive a high polish. The final polish is given by means of rouge, which produces a beautiful velvety surface. The softer kinds, not capable of being freely worked, are known as bastard jet. From the estuarine beds of the Lower Oolites of Yorkshire, a soft jet is obtained; but, though occasionally used for ornamental purposes, it is far inferior to the true Whitby jet. Spanish jet has been largely imported into Whitby, but is deficient in hardness and lustre. Cannel coal from Scotland is occasionally used in the place of jet; and it is not uncommon for brooches to be made of a carving of Whitby jet set in a plain polished rim of either Spanish jet or cannel.

For descriptions of jet and jet-working see *The Yorkshire Lias*, by Ralph Tate and J. F. Blake, 1876; and a paper on *Whitby Jet*, by J. A. Bower, in *Jour. Soc. Arts*, December 19, 1873.

JEW, The Wandering. The legend of a Jew doomed to wander until the day of judgment, for an insult offered to Christ, is first mentioned by Roger of Wendover in the Chronicle completed by Matthew Paris, who received the story from an Armenian bishop, who visited England in the year 1228. As told in Matthew's *Historia Major*, the legend runs that the wanderer's name was Cartaphilus, that he was doorkeeper of Pilate's palace, and that as Jesus was led out to be crucified he struck him on the neck, saying, "Go, Jesus, go on faster; why dost thou linger?" Jesus replied, "I go, but thou shalt remain waiting till I return." The Armenian bishop, if his French servant and interpreter is to be trusted, said that this wanderer had dined with him shortly before his leaving home, and that he was now a penitent man and had been baptized by Ananias, who also baptized Paul, under the name of Joseph. At the time of the crucifixion he was thirty years of age; whenever he reaches the age of one hundred he becomes faint, and when he becomes conscious again he is as young as when his doom was pronounced. He never smiles, refuses all gifts, and narrates many ancient events to those who come from far and near to listen. On the same authority rests the somewhat later account by Philippe de Mousket in his *Chronique rimée*. The English chronicler states that the bishop's statement was in reply to a question whether he had seen or heard of one Joseph, said to have been present at the crucifixion to be preserved in the world as a witness of that event. It would appear, therefore, that there was already in existence a legend of an undying Jew, although nothing was intimated of his insult to Christ. The idea of wandering did not enter into the legend until a later period, when persons pretending to be the undying Jew appeared in various parts of Europe. Near the middle of the 16th century the legend appears in Germany, brought there by a man who professed to be the "Ewige Jude" himself. He appeared at Hamburg, in 1547, giving his name as Ahasuerus, and stating that he had been a shoemaker in Jerusalem who would not suffer Christ to rest at his door when fainting under the weight of the cross. He struck Jesus, and bade him move on. Jesus said, "I will stand here and rest, but thou shalt go on until the last day." This story, however, also rests upon the authority of an irresponsible reporter. It is attributed to Dr. Paulus Von Eizen, bishop of Schleswig, whose long conversations with Ahasuerus are given, in a work by one Chrysostomus Dudulæus Westphalus, —probably a pseudonym. This was published some years after the death of Paulus Von Eizen, which occurred in 1598, and its aim is to make the story as sensational as possible as a "warning." This earliest known book on the legend, published at Leipsic, 1602, professes to be derived from a previous one:—*Strange Report of a Jew born at Jerusalem, who pretends he was present at the crucifixion of Christ; newly printed at Leyden*. Other small works appeared somewhat later, as at "Augsburg, 1619," and elsewhere, and were continued throughout the 17th century, these containing rumors of the Jew's appearance in Hamburg, Dantzic, Naumburg, Lübeck, Brussels, Moscow, and Madrid. Rudolph Botoreus, parliamentary advocate of Paris (*Comm. histor.*, 1604), mentions contemptuously the rumors of the appearance of this Jew in Germany, Spain, and Italy, and the popular credulity. The most important account of any of these monomaniacs or pretenders is that given of one in Paris (1644) by *The Turkish Spy* (book iii., letter i.). "One day I had the curiosity to discourse with him in several languages; and I found him master of all those I could speak. I conversed with him five or six hours together in Arabic." "The common people are ready to adore him; and the very fear of the multitude restrains the magistrates from offering any violence to this impostor." From a letter of Madame de Mazarin to Madame de Bouillon, it appears that an individual appeared in England in the beginning of the 18th century professing to have been an officer of rank in Jerusalem who for an insult given to Jesus was doomed to live and wander. It is said that the universities sent professors to cross-examine him, and that many were satisfied of the truth of his story. Several pretenders of the kind appeared in England in the last century. Brand remembered to have seen one going about the streets of Newcastle muttering "Poor John alone." It is difficult, however, to discover whether in all these cases the rôle of the Wandering Jew was assumed or was added to aged beggars by popular credulity.

The names given to these wanderers are various. Cartaphilus is probably κάρτα φίλος, the "much beloved," in allusion to St. John, who was believed to "tarry" until the coming of Christ. Joseph was perhaps caught from the legend of Joseph of Arimathæa, who was said to have wandered into Britian in the year 63, when his flowering staff indicated the spot where Glastonbury abbey should be built. *The Turkish Spy* in Paris gives his name as Michob Ader; Libavius (*Praxis Alchymiæ*) as Butadæus. In Brussels he was called Isaac Laquedem, a name believed by Grässe to be the French *la* combined with *kedem*, Heb. for "aforetime." Mr. Karl Blind has suggested that his name in Germany, Ahasuerus, may have been formed out of a corruption of As-Vidar, "god Vidar,"—the Teutonic deity who was to survive the destruction of the world and conquer the wolf Fenris by thrusting his foot covered with an enormous shoe down the monster's throat (*Gentleman's Magazine*, July, 1880). This ingenious suggestion would account for the transformation of the wanderer between 1228, when the Armenian bishop described him as Pilate's doorkeeper, and 1547, when he claims to have been a shoemaker. For a long time there were kept at Bern and also at Ulm enormous pairs of shoes said to have been left by the Wandering Jew on his visits to those places.

The legend of the Wandering Jew seems clearly related to a class of myths, found in every part of the world, in which certain saints or heroes are represented as having never died. Many of these myths,—as those of King Arthur, Charlemagne, Barbarossa, Tell, —are no doubt ethnically connected; but the corresponding myths found among the Incas, and among various American tribes, may lead us to seek for a common root of them all in human nature,—in the unwillingness of men to believe that their heroes can be really dead. In a primitive race which had not yet conceived the idea of animistic immortality, the notion of a continued existence in happy isles, valleys, or grottoes, would naturally arise. The earliest instance of this earthly immortality would appear to be that of the Persian Yima, king of the Golden Age, who, in the Zend-Avesta, "gathers around him men and animals in flocks, and fills the earth with them, and after the evils of winter had come over his territories leads a select number of the beings of the good creation to a secluded spot where they enjoy uninterrupted happiness" (Haug's *Essays*, etc., p. 277). In a corresponding phase of development the Semitic races ascribed a similar terrestrial immortality to Enoch, Elijah, and some others. The Arabs have very particular accounts of the secret abodes of these; and there are indications that in Eastern folklore Moses was believed to be sleeping in his unknown sepulchre.

By the action of religious dualism on this belief there arose evil counterparts of the immortal heroes, who instead of dwelling in blissful retreats were doomed to wander without finding even the repose of the grave. Of this class Cain was the most conspicuous, and the Bedouin still feels his presence in the feverish desert-winds (Cain-winds), as the Picardy peasant says of a destructive gale, *C'est le juif errant qui passe.* Esau, Ishmael, and others have been evil wanderers in the superstitions of various localities; but there is one tradition of high antiquity which would appear to have especially prepared the way for our legend. It is related by G. Weil (*The Bible, The Koran, and the Talmud*, p. 127) that, according to this tradition, the golden calf was made by Al Samiri. Moses was about to put this man to death when Allah declared he should be banished. "Ever since that time he (Samiri) roams like a wild beast throughout the world; every one shuns him, and purifies the ground on which his feet have stood; and he himself, whenever he approaches men, exclaims, 'Touch me not!'" There also arose a belief that this monster dwelt with his progeny on a rocky island in the Arabian Gulf, from which emanated the plague (Sale, *Koran*, xx.).

These traditions were inherited by the folklore of Christendom. The mantle of Enoch and Elijah, and other saintly sleepers, fell upon the seven supposed to be slumbering in a cave near Ephesus, near to the slumbering St. John, belief in whose earthly immortality is mentioned in the New Testament (John xxi. 23). On the other hand, the mantle of Cain and other evil wanderers would seem to have fallen on Nero, who for some time after his death was believed by friend and foe to be still living. At a later period, after Rome had been Christianized, the idea of a perpetual enemy of the Messiah was temporarily detached from any one man and personified as Antichrist,—a restless invisible spirit appointed by the adversary to resist the rival kingdom. This more abstract conception was prolific of evil wanderers. When in course of the diffusion of Christianity throughout Europe its missionaries came in contact with popular beliefs in deities which in many cases had been developed from traditional heroes and warriors,—such as Odin, Waldemar, Vidar,—these imaginary potentates were degraded into phantoms, demons; the brand of Cain was set on their names by solemn anathema, and thenceforth all regions of space had their doomed wanderers,—the Wild Huntsman in the air, the Flying Dutchman on the sea, and various forest-phantasms like the Gros Veneur of Fontainebleau and Diedrich of Bern on the earth. The Jewish race, however, was the one race which did not yield to Christianity; its special identification with Antichrist was therefore inevitable. Many superstitions affecting them had long been accumulating. There was a belief that the seven whistlers—plovers or sometimes wild geese—were Jews that had been transformed because they had assisted in the crucifixion of Christ, and to see or hear those birds was regarded as ominous of disaster. The Witch Sabbaths were so called because the Jews were supposed to assemble at them. Their wealth was believed to be obtained from Satan. There was also a belief that they carried about plagues. This idea may partly have been derived from the tradition of Samiri and his island, already mentioned, but possibly derived some confirmation from the actual results of crowding the Jews into the confined and neglected quarters of cities, in disregard of sanitary laws. From innumerable sources like these gathered the cloud of fanaticism which sent its thunderbolts upon the Jewish people. The legend of the Wandering Jew, when it was pieced together, represented precisely the popular belief that this race, having betrayed its supernatural mission, had received a supernatural doom. The legendary figure was invested with the fatal associations of most of the demons which Christianity had degraded. He passed in the storm, presided at orgies, diffused diseases, instigated revolutions, burned cities. He was not only associated with European demons but with those of the Jewish race also. There was a wild fable about Judas,—that he had fulfilled a fearful dream of his mother before his birth, living, despite her throwing him into the sea, to "kill his father and sell his God,"—which reappears in our legend. Judas was said to have become page to Pilate, as Cartaphilus was his doorkeeper. Death refused to touch Judas until his doom had been fulfilled, as it spared the Wandering Jew. In the familiar legend of the discovery of the True Cross, the Jew who, after torture, points out its place of concealment to Helena is named Judas; and M. Magnin has plausibly suggested that the story of the Wandering Jew grew up in connection with the True Cross legend. As Cain was a prototype of Judas, so was Judas of such doomed wanderers as Malchus in Italy and Ahasuerus in Germany. M. Gaston Paris believes the legend of Malchus to be the earlier. He was said to have struck Jesus with an iron bar, and to have been condemned to walk until judgment-day around a subterrannean column, against which he often dashes his head in the vain hope of death.

The respect shown by peasants to persons pretending to be the Wandering Jew was such as might have been expected for Cain with a mark upon his brow defending him from the hand of men. Such a mark was indeed supposed to be on the Wandering Jew's forehead. Xemola says it was a red cross concealed by a black bandage, on which account the Inquisition vainly tried to find him. While persecuting actual Jews, the peasantry had some compassion for this imaginary one, and in some parts of Germany two harrows were sometimes left in the field, set up together with teeth downward, it being believed that so the wanderer might obtain a night's rest.

The Wandering Jew has been a favorite subject of poetry and romance. Goethe (*Dichtung und Wahrheit*, xv.) has given the scheme of a dramatic poem on the theme which he had contemplated. It has been dealt with by C. F. D. Schubart, *Der ewige Jude*, 1787; A.W. Schlegel, *Warnung*, 1811; Aloys Schreiber, *Der ewige Jude*, 1807; W. Müller, *Wanderliedern*, 1830; Edgar Quinet, *Ahasuerus*, 1833; Chamisso, *Neuer Ahasuer*, 1836; F. Hauttral, *Ahasueriad*, 1838; Julius Mosen, *Ahasuer*, 1838; Ludwig Köhler, *Der neue Ahasuer*, 1841; Nicolas Lenau, *Ahasuer*, 1843. H. C. Andersen, *Ahasuerus*, 1847; E. Grenier, *La mort du Juif-Errant*, 1857. Béranger (1831) and Wordsworth have written lyrical poems on the subject. Shelley evokes the Wandering Jew six times, notably in his *Queen Mab*. In 1812 a comedy based on the legend by Craignez was performed in Paris. Klingemann's tragedy *Ahasuerus* (1827) was successful as a play. Eugene Sue's romance (1844), which stimulated popular interest in the legend, has also been often acted. Several German novels have been founded on the legend, the most important being those of Franz Horn, Th. Oelckers, and F. Laun. In England, where the legend had been made familiar by the ballad in *Percy's Reliques*, there was acted at Drury Lane, in 1797, a comedy by Andrew Franklin, entitled *The Wandering Jew, or Love's Masquerade.* George Croly's novel *Salathiel* is on this subject. See Dr. J. G. Th. Grässe, *Die Sage vom Ewigen Juden, historisch entwickelt*, etc., Dresd. and Leipsic, 1844; Herzog's *Real-Encyclopädie;* Friedrich Helbig, *Die Sage vom "Ewigen Juden," ihre practische Wandlung und Fortbildung*, Berlin, 1874; C. Schoebel, *La legende du Juif-Errant*, Paris, 1877; Gaston Paris, *Le Juif-Errant*, Paris, 1880. (M. D. C.)

JEWEL, or JEWELL, JOHN (1522–1571), bishop of Salisbury, was born May 24th, 1522, at Berry Narbor, near Ilfracombe, Devonshire. At the age of thirteen he entered Merton College, Oxford, where he had for tutor John Parkhurst, afterwards bishop of Norwich, from whom his mind received a bias towards Protestanism. Becoming tutor in Corpus Christi College in 1539, he in his turn took the opportunity of inculcating Protestant principles on his pupils; and in 1546 he received an allowance from a private fund instituted for the benefit of indigent scholars who publicly professed the doctrines of the Reformed faith. After the accession of Mary in 1553 he was expelled by the fellows from the college on account of his opinions, and in a moment of weakness he was induced to sign his adherence to a form of doctrine essentially Romanistic. He, however, speedily repented of his momentary faithlessness to his convictions, and in order to escape the penalties of martyrdom he fled in 1555 to Frankfort, where he publicly abjured his former recantation. On the death of Mary he returned to England. He was one of the learned Protestant doctors appointed to dispute before Elizabeth at Westminster with a like number of Catholics. In the beginning of 1560 he was created bishop of Salisbury, and in the same year he published, with the sanction of the queen and bishops, his *Apologia Ecclesiæ Anglicanæ*, which was in fact an argument against the decision of the pope to exclude the Reformers from the council of Trent, convoked to be held in December of that year. The work, as was to be expected, excited very great attention at the time; it was condemned at the meeting of the council, who appointed two divines to reply to its arguments. It was translated into English by Anna, wife of Sir Nicholas Bacon, and Elizabeth ordered that a copy of it should be chained in every parish church in England. Its chief English opponent was Thomas Harding, who in 1565 published a *Confutation of the Apology*, to which Jewel replied in 1567 by the *Defence of the Apology*. The general argument of Jewel is that unity or predominance of opinion is not a test of truth, and although he denied that Rome had the support of the fathers, he rested his general case on the fact that the foundation on which the Church of England was built was not that of the fathers but of the apostles and Jesus Christ. His views were strongly anti-sacramentarian, as he held that the Lord's Supper had nothing more than a commemorative use. Jewel died suddenly at Monkton Farleigh, a small village in his diocese, September 22, 1571.

Joannis Juelli vita et mors, T. Humfredo autore, was published at London in 1573. The *Apology*, translated with notes and life by Isaacson, appeared in 1823, and the other biographies of Jewel are one by Le Bas in the Theological Library, 1835, and a short sketch published by the Society for the Promotion of Christian Knowledge, 1850. His works, which are mostly controversial, were collected by Dr. R.W. Jelf, and published in 8 vols. at Oxford, 1848.

Plates XI., XII.

JEWELLERY (Latin, *gaudium;* French, *jouel*, *joyau*). Personal ornaments appear to have been among the very first objects on which the invention and ingenuity of man were exercised; and there is no record of any people so rude as not to employ some kind of personal decoration. Natural objects, such as small shells, dried berries, small perforated stones, feathers of variegated colors, were combined by stringing or tying together to ornament the head, neck, arms, and legs, the fingers, and even the toes, whilst the cartilages of the nose and ears were frequently perforated for the more ready suspension of suitable ornaments.

Amongst modern Oriental nations we find almost every kind of personal decoration, from the simple caste mark on the forehead of the Hindu to the gorgeous examples of beaten gold and silver work of the various cities and provinces of India. Nor are such decorations mere ornaments without use or meaning. The hook with its corresponding perforation or eye, the clasp, the buckle, the button, grew step by step into a special ornament, according to the rank, means, taste, and wants of the wearer, or became an evidence of the dignity of office. That these ornaments were considered to have some representative purpose even after death is abundantly proved; for it is in truth to the tombs of the various ancient peoples that we must look for evidence of the early existence of the jeweller's art.

That the Assyrians used personal decorations of a very distinct character, and possibly made of precious materials, is proved by the bas reliefs. In the British Museum we have a representation of Samsi Vul IV., king of Assyria 825 B.C). He wears a cross (Plate XI. fig. 1) very similar to the Maltese cross of modern times. The still more ancient Egyptian jewellery is distinctly brought before us by the objects themselves, placed with the embalmed bodies of the former wearers in sarcophagi, only to be opened in our own time. The most remarkable collection of Egyptian art in this direction is to be found in the jewellery taken from the coffin of Queen Aah-hotep, discovered by M. Mariette in the entrance to the valley of the Tombs of the Kings in 1859, and now preserved in the Búlák museum. In these objects we find the same ingenuity and perfect mastery of the materials as characterize the monumental work of the Egyptians. Hammered work, incised and chased work, the evidence of soldering, the combination of layers of gold plates, together with colored stones, are all there,—the handicraft being complete in every respect.

A diadem of gold and enamel, found at the back of the head of the mummy of the queen (fig. 2), was fixed in the back hair, showing the cartouche in front. The box holding this cartouche has on the upper surface the titles of the king, "the son of the sun, Aahmes, living forever and ever," in gold on a ground of lapis lazuli, with a chequered ornament in blue and red pastes, and a sphinx couchant on each side. A necklace of the order or decoration of the Fly (fig. 3) is entirely of gold, having a hook and loop to fasten it round the neck. A small porcelain cylinder (fig. 4) is ornamented with interlaced lotus flowers in intaglio, having a ring for suspension, and fig. 5 is a gold drop, inlaid with turquoise or blue paste, in the shape of a fig. A gold chain (fig. 7) is formed of wires closely plaited and very flexible, the ends terminating in the heads of water fowl, and having small rings to secure the collar behind. To the centre is suspended by a small ring a scarabeus of solid gold inlaid with lapis lazuli. These scarabei were in constant use in Egyptian ornaments, and were worn in rings by the military caste. We have an example of a bracelet, similar to those in modern use (fig. 6), and worn by all persons of rank. It is formed of two pieces joined by a hinge, and is decorated with figures in repoussé with a ground inlaid with lapis lazuli. A signet ring (fig. 8) has a square revolving bezel on which are four serpents interlaced.

The discoveries of Dr. Schliemann at Mycenæ and at Hissarlik, the assumed site of ancient Troy, supply further illustrations of ancient jewellery and gold work. In extent and in the wonderful character of the design and workmanship, the relics found at Mycenæ present the most perfect examples, although some of the objects brought from the "burnt city" at Hissarlik give evidence of singular skill and ingenuity in the methods of combining the various portions of an ornament and finesse in working the gold. From Mycenæ the objects ranged over most of the personal ornaments still in use: necklaces with gold beads and pendants, butterflies (fig. 16), cuttlefish (fig. 10), single and concentric circles, rosettes, and leafage, with perforations for attachment to clothing, crosses (fig. 9), and stars formed of combined crosses, with crosses in the centre forming spikes,—all elaborately ornamented in detail. The spiral forms an incessant decoration from its facile production and repetition by means of twisted gold wire. Grasshoppers or tree crickets in gold repoussé suspended by chains and probably used for the decoration of the hair, and a griffin (fig. 17), having the upper part of the body of an eagle and the lower parts of a lion, with wings decorated with spirals, are among the more remarkable examples of perforated ornaments for attachment to the clothing. There are also perforated ornaments belonging to necklaces, with intaglio engravings of such subjects as Hercules and the Nemean lion, and a duel of two

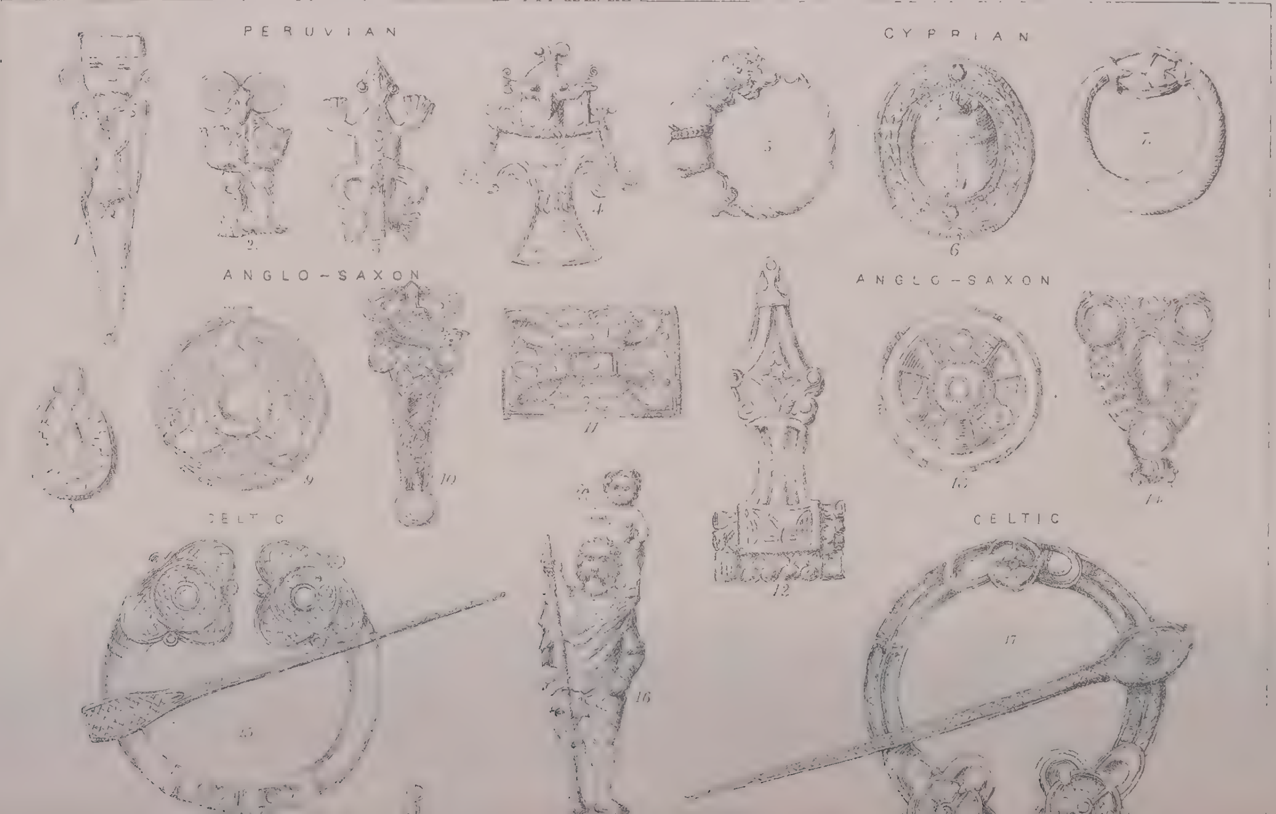
VOL. XIII. JEWELLERY PLATE XII.



warriors, possibly Hector and Achilles, one of whom stabs his antagonist in the throat. Another has a representation of a lion, very archaic in treatment, the style resembling that of the fore part of the lion found on the statue of Sardis, attributed to Crœsus, 560 B.C. There are also pinheads and brooches formed of two stags lying down (fig. 15), the bodies and necks crossing each other, and the horns meeting symmetrically above the heads, forming a finial. The heads of these ornaments were of gold, with silver blades or pointed pins inserted for use. The bodies of the two stags rest on fronds of the date-palm growing out of the stem which receives the pin. Another remarkable series is composed of figures of women with doves (fig. 20). Some have one dove resting on the head; others have three doves, one on the head and the others resting on the arms. The arms in both instances are extended to the elbow, the hands being placed on the breasts. These ornaments are also perforated, and were evidently sewed on the dresses, although there is some evidence that an example with three doves has been fastened with a pin.

Mention must be made of an extraordinary diadem found upon the head of one of the bodies discovered in the same tomb with many objects similar to those noticed above. It is 25 inches in length, covered with shield-like or rosette ornaments in repoussé, the relief being very low but perfectly distinct, and further ornamented by thirty-six large leaves of repoussé gold attached to it. As an example of design and perfection of detail, another smaller diadem found in another tomb may be noted (fig. 11). It is of gold plate, so thick as to require no "piping" at the back to sustain it; but in general the repoussé examples have a piping of copper wire. Diadems of similar form are found on statues of Aphrodite, and also on statuettes of Hercules in ivory, in the Assyrian collection at the British Museum. Fig. 13 represents a remarkably elegant pendant ornament, the design being of an exceptionally beautiful character. A cross of thin gold work formed of four leaves (fig. 18), a finial-like ornament (fig. 19), and the head of a pin or brooch evidently suggested by a butterfly (fig. 14), are all characteristic of the gold work of Mycenæ.

The gold ornaments found at Hissarlik, in what Dr. Schliemann calls the "Treasury of Priam," partake in most instances of the same characteristics as those found in the sepulchres at Mycenæ. There are necklaces, brooches, bracelets (fig. 29), hair-pins (fig. 23), earrings (figs. 21, 22, 25, 26, 27, 28), with and without pendants, beads, and twisted wire drops. The majority of these are ornamented with spirals of twisted wire, or small rosettes, with fragments of stones in the centres. The twisted wire ornaments were evidently portions of necklaces. A circular plaque decorated with a rosette (fig. 30) is very similar to those found at Mycenæ, and a conventionalized eagle (fig. 31) is characteristic of much of the detail found at that place as well as at Hissarlik. They were all of pure gold, and the wire must have been drawn through a plate of harder metal—probably bronze. The principal ornaments differing from those found at Mycenæ are diadems or head fillets of pure hammered gold (fig. 24) cut into thin plates, attached to rings by double gold wires, and fastened together at the back with thin twisted wire. To these pendants (of which those at the two ends are nearly three times the length of those forming the central portions) are attached small figures, probably of idols. It has been assumed that these were worn across the forehead by women, the long pendants falling on each side of the face. If, however, the position on which they were found was formerly part of a temple instead of a palace, it may be suggested that they were used as veils for the priests when giving forth the oracles from the shrine.

Jewellery and gold work of a very similar character has been found at Cyprus within the last few years by Major Cesnola. The rings (Plate XII. figs. 5 and 6) have a great resemblance to the Greek, whilst the beetle, which is of green stone set in gold (fig. 6), has a very Egyptian-like appearance. The great similarity in design and workmanship between these Eastern examples and the gold jewellery and personal ornaments found in Peru and Mexico (figs. 1, 2, 3, 4) is not a little remarkable. These, however, are more rude in design, though equally good in workmanship.

Greek, Etruscan, and Roman ornaments partake of very similar characteristics. Of course there is variety in design and sometimes in treatment, but it does not rise to any special individuality. Fretwork is a distinguishing feature of all, together with the wave ornament, the guilloche, and the occasional use of the human figure. The workmanship is often of a character which modern gold workers can only rival with their best skill, and can never surpass. The pendant oblong ornament for containing a scroll (Plate XI. fig. 34) is an example of this, as also the Italo-Greek earring (fig. 32). The earring (fig. 36) is an exquisite illustration of Greek skill in the introduction of the human figure; the rosette for concealing the hook and the winged ornament at the back of the Cupid are beautifully wrought. The other earrings (figs. 33, 35, 37) are all characteristic. The Etruscan examples are of the same character. The pendant (fig. 40), the rosette (fig. 38), and the plaque of gold (fig. 38) repeat some of the forms found at Mycenæ, with possibly a little more classic grace of detail and refinement of workmanship. The brooch (fig. 41) is perhaps the most characteristic example of purely classic design, essentially Greek in its principal details, whilst the workmanship is all that can be desired.

The granulation of surfaces practised by the Etruscans was long a puzzle and a problem to the modern jeweller, until Signor Castellani of Rome discovered gold workers in the Abruzzi to whom the method had descended through many generations, and, by inducing some of these men to go to Naples, revived the art, of which he contributed examples to the London Exhibition of 1872, successfully applied to modern designs.

The Merovingian jewellery of the 5th century, the Anglo-Saxon of a later date, and the Celtic as leading to the Gothic or mediæval, have each distinguishing features. In the first two the characteristics are thin plates of gold, decorated with thin slabs of garnet, set in walls of gold soldered vertically like the lines of cloisonné enamel, with the addition of very decorative details of filigree work, beading, and twisted gold. In Plate XII. figs. 9 and 13 we have examples of Anglo-Saxon fibulæ, the first being decorated with a species of cloisonné, in which garnets are inserted, while the other is in hammered work in relief. A pendant (fig. 8) is also set with garnets. The buckles (figs. 10, 11, 12) are remarkably characteristic examples, and very elegant in design. A girdle ornament in gold, set with garnets (fig. 14), is an example of Carlovingian design of a high class. The Celtic ornaments are of hammered work, adapted to uses now comparatively unknown, but display another style of workmanship,—details in repoussé, fillings in with amber, rock crystal with a smooth rounded surface cut *en cabochon*, with the addition of vitreous pastes. The minute filigree and plaited work, in combination with niello and enamel, communicate to the ornaments of this class found in Ireland and Scotland an unmistakable Oriental spirit alike in design and workmanship.

In figs. 15 and 17 are illustrations of two brooches. The first is 13th century; the latter is probably 12th century, and is set with paste, amber, and blue. The brooch in the form of a figure of St. Christopher bearing the infant Saviour, and supported by his staff (fig. 16), is of silver gilt. Chaucer mentions such a brooch as worn by the yeoman:—"A Crystofre on his brest of silvyr schene."

Rings are the chief specimens now seen of mediæval jewellery from the 10th to the 13th century. They are generally massive and simple. Through the 16th century a variety of changes arose; in the traditions and designs of the *Cinquecento* we have plenty of evidence that the workmen used their own designs, and the results culminated in the triumphs of Albert Dürer, Benvenuto Cellini, and Hans Holbein. The goldsmiths of the Italian republics must have produced works of surpassing excellence in workmanship, and reaching the highest point in design as applied to handicrafts of any kind. The use of enamels, precious stones, niello work, and engraving, in combination with skilful execution of the human figure and animal life, produced effects which modern art in this direction is not likely to approach, still less to rival.

In Plate XII. illlustrations are given of various characteristic specimens of the Renaissance, and later forms of jewellery. A crystal cross set in enamelled gold (fig. 18) is German work of the 16th century. The pendant reliquary (fig. 19), enamelled and jewelled, is of 16th century Italian work, and so probably is the jewel (fig. 20) of gold set with diamonds and rubies.

The Darnley or Lenox jewel (fig. 21), now in the possession of the Queen, was made about 1576–7 for Lady Margaret Douglas, countess of Lenox, the mother of Henry Darnley. It is a pendant golden heart set with a heart-shaped sapphire, richly jewelled and enamelled with emblematic figures and devices. It also has Scottish mottoes around and within it. The earring (fig. 22) of gold, enamelled, hung with small pearls, is an example of 17th century Russian work, and another (fig. 23) is Italian of the same period, being of gold and filigree with enamel, also with pendant pearls. A Spanish earring, of 18th century work (fig. 24), is a combination of ribbon, cord, and filigree in gold; and another (fig. 25) is Flemish, of probably the same period; it is of gold open work set with diamonds in projecting collets. The old French-Normandy pendant cross and locket (fig. 26) presents a characteristic example of peasant jewellery; it is of branched open work set with bosses and ridged ornaments of crystal. The earring (fig. 27) is French of 17th century, also of gold open work set with crystals. A small pendant locket (fig. 28) is of rock crystal, with the cross of Santiago in gold and translucent crimson enamel; it is 16th or 17th century Spanish work. A pretty earring of gold open scroll work (fig. 29), set with minute diamonds and three pendant pearls, is Portuguese of 17th century, and another earring (fig. 30) of gold circular open work, set also with minute diamonds, is Portuguese work of 18th century. These examples fairly illustrate the general features of the most characteristic jewellery of the dates quoted.

During the 17th and 18th centuries we see only a mechanical kind of excellence, the results of the mere tradition of the workshop,—the lingering of the power which when wisely directed had done so much and so well, but now simply living on traditional forms, often combined in a most incongruous fashion. Gorgeous effects were aimed at by massing the gold, and introducing stones elaborately cut in themselves, or clustered in groups. Thus diamonds were clustered in rosettes and bouquets; rubies, pearls, emeralds, and other colored special stones were brought together for little other purpose than to get them into a given space in conjunction with a certain quantity of gold. The question was not of design in its relation to use as personal decoration, but of the value which could be got into a given space to produce the most striking effect.

The traditions of Oriental design as they had come down through the various periods quoted, were comparatively lost in the wretched results of the *rococo* of Louis XIV. and the inanities of what modern revivalists of the Anglo-Dutch call "Queen Anne." In the London Exhibition of 1851, the extravagances of modern jewellery had to stand a comparison with the Oriental examples contributed from India. Since then we have learnt more about these works, and have been compelled to acknowledge, in spite of what is sometimes called inferiority of workmanship, how completely the Oriental jeweller understood his work, and with what singular simplicity of method he carried it out. The combinations are always harmonious, the result aimed at always achieved; and, if in attempting to work to European ideas the jeweller failed, this was rather the fault of the forms he had to follow than due to any want of skill in making the most of a subject in which half the thought and the intended use were foreign to his experience.

A collection of peasant jewellery got together by Castellani for the Paris Exhibition of 1867, and now in the South Kensington Museum, illustrates in an admirable manner the traditional jewellery and personal ornaments of a wide range of peoples in Europe. This collection, and the additions made to it since its acquisition by the nation, show the forms in which these objects existed over several generations among the peasantry of France (chiefly Normandy), Spain, Portugal, Holland, Denmark, Germany, and Switzerland, and also show how the forms popular in one country are followed and adopted in another, almost invariably because of their perfect adaptation to the purpose for which they were designed.

So far we have gone over the progress and results of the jeweller's art in the past. We have now to speak of the production of jewellery as a modern art industry, in which large numbers of men and women are employed in the larger cities of Europe, but which also has its special localities in which it flourishes, and out of which an important national commerce arises.

Nearly all the great capitals of Europe produce jewellery, but Paris, Vienna, London, and Birmingham are the most important centres. An illustration of methods and processes and the various kinds of jewellery produced at the present day in the manufacture as carried on in London and Birmingham will be sufficient for all practical purposes, and as giving an insight into the technique and artistic manipulation of this branch of art industry; but, by way of contrast, it may be interesting to give in the first place a description of the native working jeweller of Hindustan. Travelling very much after the fashion of a tinker in England, his "budget" contains tools, materials, fire pots, and all the requisites of his handicraft. The gold to be used is generally supplied by the patron or employer, and is frequently in gold coin, which the travelling jeweller undertakes to convert into the ornaments required. He squats down in the corner of the courtyard, or under cover of a veranda, lights his fire, cuts up the gold pieces entrusted to him, hammers, cuts, shapes, drills, solders with the blow-pipe, files, scrapes, and burnishes until he has produced the desired effect. If he has stones to set or colored enamels to introduce, he never seems to make a mistake; his instinct for harmony of color, like that of his brother craftsman the weaver, is as unerring as that of the bird in the construction of its nest. Whether the materials are common or rich and rare, he invariably does the very best possible with them, according to native ideas of beauty in design and combination. It is only when he is interfered with by European dictation that he ever vulgarizes his art or makes a mistake. The result may appear rude in its finish, but the design and the thought are invariably right. We thus see how a trade in the working of which the "plant" is so simple and wants are so readily met could spread itself, as in years past it did at Clerkenwell and at Birmingham, before gigantic factories were invented for producing everything under the sun.

It is impossible to find any date at which the systematic production of jewellery was introduced into England. Probably the Clerkenwell trade dates its origin from the revocation of the Edict of Nantes, as the skilled artisans in jewellery, clock and watch, and trinket trades appear to have been descendants of the emigrant Huguenots, as the Spitalfields weavers were.

The Birmingham trade would appear to have had its origin in the skill to which the workers in fine steel had attained towards the middle and end of last century, a branch of industry which collapsed after the French Revolution.

Modern jewellery may be classified under three heads: —(1) objects in which gems and stones form the principal portions, and in which the gold work is really only a means for carrying out the design by fixing the gems or stones in the position arranged by the designer, the gold being visible only as a "setting;" (2) when gold work plays an important part in the development of the design, being itself ornamented by engraving or enamelling or both, the stones and gems being arranged in subordination to the gold work in such positions as to give a decorative effect to the whole; (3) when gold or other metal is alone used, the design being wrought out by hammering in repoussé, casting, engraving, or chasing, or the surfaces left absolutely plain but polished and highly finished.

Of course the most ancient and primitive methods are those wholly dependent upon the craft of the workman; but gradually various ingenious processes were invented, by which greater accuracy in the portions to be repeated in a design could be produced with certainty and economy: hence the various methods of stamping used in the production of hand-made jewellery, which are in themselves as much mechanical in relation to the end in view as if the whole object were stamped out at a blow, twisted into its proper position as regards the detail, or the various stamped portions fitted into each other for the mechanical completion of the work. It is therefore rather difficult to draw an absolute line between hand-made and machine-made jewellery, except in extreme cases of hand-made, when everything is worked, so to speak, from the solid, or of machine-made, when the hand has only to give the ornament a few touches of a tool, or fit the parts together if of more than one piece.

The best and most costly hand-made jewellery produced in England, whether as regards gold work, gems, enamelling, or engraving, is made in London, and chiefly at Clerkenwell. A design is first made on paper, or drawn and colored, and when needful with separate enlargement of details, everything in short to make the drawing thoroughly intelligible to the working jeweller. According to the nature and purpose of the design, he cuts out, hammers, files, and brings into shape the constructive portions of the work as a basis. Upon this, as each detail is wrought out, he solders, or fixes by rivets, etc., the ornamentation necessary to the effect. The human figure, representations of animal life, leaves, fruit, etc., are modelled in wax, moulded, and cast in gold, to be chased up and finished. As the hammering goes on the metal becomes brittle and hard, and then it is passed through the fire to anneal or soften it, in fact to restore the particles of gold to their original position. In the case of elaborate examples of repoussé, after the general forms are beaten up, the interior is filled with a resinous compound, pitch mixed with fire-brick dust; and this, forming a solid but pliable body underneath the metal, allows of the finished details being wrought out on the front of the design, and being finally completed by chasing. When stones are to be set, or when they form the principal portions of the design, the gold has to be wrought by hand so as to receive them in little cup-like orifices, these walls of gold enclosing the stone and allowing the edges to be bent over to secure it. Setting is never effected by cement in well-made jewellery. Machine-made settings have in recent years been made, but these are simply cheap imitations of the true hand-made setting. Even strips of gold have been used, serrated at the edges to allow of being easily bent over, for the retention of the stones, true or false.

Great skill and experience are necessary in the proper setting of stones and gems of high value, in order to bring out the greatest amount of brilliancy and color and the angle at which a diamond (say) shall be set, in order that the light shall penetrate at the proper point to bring out the "spark" or "flash," is a subject of grave consideration to the setter. Stones set in a haphazard, slovenly manner, however brilliant in themselves, will look commonplace by the side of skilfully set gems of much less fine quality and water. Enamelling has of late years largely taken the place of "paste" or false stones. This may be divided into two kinds—*champlevé* and *cloisonné*. In champlevé the enamelling substance is applied to the surface of the gold as ornamental details, and is "fired" in a muffle or furnace under the eye of the enameller. Here the metallic oxides play an important part in imparting variety of color, as in the case of the "strass" of which "paste" or false stones are made. Cloisonné enamelling is effected by walls of gold wire being fastened to the surface to be decorated, upon which surface the design has been already drawn in outline. Within these walls or "cloisons" the various-colored enamels are placed, and the whole fixed together by firing until the surface is more than filled up. The surface is levelled by grinding down with pumice stone, and then polished. One kind of champlevé closely approaches in its character to cloisonné. It is when the gold is thick enough to allow of portions to be cut away by the graver, and in these incised parts the colored enamels are fused as in the manner of the true cloisonné.

Enamelled subjects or paintings, portraits, landscapes, animals' heads, etc., are sometimes used as a setting for pins, brooches, pendants, bracelets, etc. These are of course true champlevé; and formerly very able artists, such as Bone, Essex, and others, were employed in the production of costly works of this kind.

Engraving is a simple process within itself, and diversity of effect can be produced by skilful manipulation. An interesting variety in the effect of a single ornament is often produced by the combination of colored gold of various tints. This coloring is a chemical process of great delicacy, and requires much skill and experience in the manipulation, according to the quality of the gold and the amount of silver alloy in it. Of general coloring it may be said that the object aimed at is to enhance the appearance of the gold by removing the particles of alloy on the surface, and thus allowing the pure gold only to remain visible to the eye.

The application of machinery to the economical production of certain classes of jewellery, not necessarily imitations, but as much "real gold" work, to use a trade phrase, as the best hand-made, has been on the increase for many years. Nearly every kind of gold chain now made is manufactured by machinery, and nothing like the beauty of design or perfection of workmanship could be obtained by hand at, probably, any cost. The question therefore in relation to chains is not the mode of manufacture, but the quality of the metal. Eighteen carat gold is of course always affected by those who wear chains, but this is only gold in the proportion of 18 to 24, pure gold being represented by 24. The gold coin of the realm is 22 carat; that is, it contains one-twelfth of alloy to harden it to stand wear and tear. Thus 18 carat gold has one-fourth of alloy, and so on with lower qualities down to 12, which is in reality only gold by courtesy.

The application of machinery to the production of personal ornaments in gold and silver can only be economically and successfully carried on when there is a large demand for similar objects, that is to say, objects of precisely the same design and decoration throughout. In hand-made jewellery, so-called, mechanical appliances are only used to economize time and reduce the necessity for the handicraftsman doing that which can be done as well, perhaps better, by some simple mechanical method applied under the hand. In machine-made jewellery everything is stereotyped, so to speak, and the only work required for the hand is to fit the parts together,—in some instances scarcely that. A design is made, and from it steel dies are sunk for stamping out as rapidly as possible from a plate of rolled metal the portion represented by each die. It is in these steel dies that the skill of the artist die-sinker is manifested. Brooches, earrings, pinheads, bracelets, lockets, pendants, etc., are struck out by the gross. This is more especially the case in silver and in plated work,—that is, imitation jewellery,—the base of which is an alloy, afterwards gilt by the electroplating process. With these ornaments imitation stones in paste and glass, pearls, etc., are used as setting, and it is remarkable that of late years some of the best designs, the most simple, appropriate, and artistic, have appeared in imitation jewelry. It is only just to those engaged in this manufacture to state distinctly that their work is never sold wholesale for anything else than what it is. The worker in gold only makes gold, or real jewellery, and he only makes of a quality well known to his customers. The producer of silver work only manufactures silver ornaments, and so on throughout the whole class of plated goods. It is the unprincipled retailer, who, taking advantage of the ignorance of the buyer, sells for gold that which is in reality an imitation, and which he bought as such.

Space will not permit of any notice of various kinds of personal ornaments coming under the head of jewellery, such as the elegantly designed hand-made pearl ornaments, Whitby jet, coral, etc., nor can we allude to the methods adopted in the workshops where gold and silver alone are used to economize the metal that would be wasted without proper precautions. Even the minute quantities of the material which adhere to the hands of the workmen are washed off before he leaves the premises, carried into a proper receptacle, and recovered by chemical agency.

The special localities of the jewellery trade proper, in England, are Clerkenwell and Pentonville in London, and Birmingham. In Clerkenwell an inquiry made some years ago showed that from 1600 to 2000 persons were employed in the trades connected with the production of jewellery and personal ornaments. In Birmingham at least 8000 were thus occupied, chiefly in the production of what may be considered as purely mechanical work. Among the higher class of jewellers in Birmingham some of the best work sold in the London shops is produced, the mechanical means employed being so ingenious, and the handicraft power so skilfully applied in fitting, setting, and finishing, as to leave little or nothing to desire, when compared with hand-made work of the same class. (G. W.)

JEWS, MODERN. An outline of the mediæval history of the Jews is given in the article ISRAEL. The modern history of the race in its political and intellectual emancipation begins with Moses Mendelssohn, who flourished at Berlin in the latter part of the 18th century. The persecutions of the Middle Ages had produced their natural effect. Cut off from their fellow-citizens, excluded by oppressive laws from all trades except that of peddling in old clothes and even from buying certain classes of these, specially taxed, confined to Ghettos and Judengassen, strictly prohibited from entering some towns, limited in numbers in others, forbidden to marry except under restrictions designed to check the growth of the Jewish population, disabled from employing Christian servants or being members of trade guilds, the Jews seemed by their abject condition to deserve the evils which were its cause. There were always, it is true, exceptions to the general degradation of the race. The exiles from the Spanish peninsula (who in western Europe were found chiefly in Amsterdam, Bordeaux, Paris, and London, and also in Hamburg and Copenhagen) were in many cases persons of distinguished culture and intelligence; having been enabled, while protected by their disguise of Christianity, to live a life more worthy of freemen than was that of their oppressed and pillaged brethren in the north. In Germany itself Frederick William, the great elector of Brandenburg (1640 to 1688), was indebted for zealous service to Gompertz and Solomon Elias. Beckman of Frankfort-on-the-Oder obtained permission in 1696 to print the Talmud. In Austria Wolf Schlesinger was personally exempted from the decree which banished the Jews from Vienna in the time of Leopold I. The Oppenheimers had sufficient influence in Austria to prevent the publication there of Eisenmenger's libels on their race; the Arnsteins, Sinzheimers, and other families earned the favor of Maria Theresa, and were decorated with titles of nobility. But the general condition of the multitude was shown by the excommunication of Spinoza at Amsterdam, by the rise of the Chasidim and of Frank, and the marvellous history of Sabbathai Zebi.

Germany.

The German Jews grew distrustful of their knowledge of their own religion, and instructed their children by the aid of long-ringletted rabbis from Poland, who overspread the country, inculcating contempt for all except the too subtle dialectics of their peculiar school of disputation. Led by these blind guides, the German Jews continued to speak their own jargon of Hebrew and German, to correspond and even endorse their commercial bills in Hebrew characters, and abandoned the hopeless attempt to enter into the general life of their country. Fortunately the hereditary desire of learning still survived, though the selection of subjects for study helped to isolate them from their happier neighbors. Moses Mendelssohn (1729–1786), who did so much to induce the Jews to become at one with the spirit of the age, and the Christians to tolerate them, was at three years old taught by his father, a professional copyist of Hebrew religious manuscripts, to repeat the wise sayings of the Talmud. Later on he found in the rabbi Fränkel, of his native town of Dessau in Anhalt, a capable and enlightened teacher. When Fränkel was promoted, the young Mendelssohn followed him, at the age of fourteen, to Berlin. In Prussia the condition of the Jews had been comparatively favored. Forty or fifty respectable families fleeing from persecutions in Austria had been admitted to Berlin towards the end of the 17th century. The colony increased, and was specially patronized in his own grotesque and tyrannical fashion by the half-mad sovereign Frederick William I. Frederick the Great held the maxim that "to oppress the Jews never brought prosperity to any Government," but his "general privilege," issued in 1750, while it abolished some old restrictions, was only a halting step in advance. It divided the Jews into two classes,—the hereditarily and the personally tolerated. In the first were those who were actually engaged in commerce or who occupied some office in connection with the synagogue. Their right of abode extended to merely one child of the family. Those who were personally tolerated were men who had means of independent subsistence, though not engaged in commerce, and their right did not descend to their children. The right to residence for a second child of each family of hereditary inhabitants was purchased by the Jews for 70,000 thalers. The restrictions imposed by Frederick on marriage were severe; poor Jews could not marry at all. No Jew was permitted to own land in fee or to possess more than forty houses. Their business was confined to trade in money or goods. Frederick the Great, penetrated as he was by the sentiments of Voltaire, yet struck out Mendelssohn's name when it was put forward for election into the Berlin Academy. Mendelssohn was with difficulty admitted into Berlin when he presented himself at its gates as a poor boy, having no friend but his teacher Fränkel. He went into a silk manufacturer's house as teacher to the children, and became a clerk and afterwards a partner in the firm. He formed a warm friendship with Lessing, and inspired the drama of *Nathan the Wise*, in which the Jew was for the first time in modern literature represented in a benevolent light. He translated the Pentateuch into German, and issued his translation in Hebrew characters, added to it a commentary in Hebrew (incorporating the rational as distinguished from the Agadistic interpretations of former Hebrew commentators), partly by himself and partly by others, whom he associated with himself, and by this and other works introduced the Jews to modern culture. At the same time he gained a distinguished place in the world of letters by the pure and exalted tone, and the charming style, of his *Philosophical Dialogues*, his *Phædo, or the Immortality of the Soul*, and other works, which showed him to be at the height of the philosophy of that time. He remained warmly attached in feeling and practice to the synagogue, and was requested by the chief rabbi of Berlin, Hirschel Levin, who for a brief period had been chief rabbi in London, to prepare the German digest of the ritual laws of the Jews, which was ordered by Frederick the Great. Every visitor to Berlin, Jew or Gentile, sought to make his acquaintance at a kind of *salon* which he held in the afternoons. By the great majority of the orthodox Jews the writings of Mendelssohn were received with delight, and it was only by exception (as in Hamburg, Prague, Fürth, and Poland) that they were fiercely denounced as rationalistic in tendency. The times were favorable to the development to which he led the way. The ideas of the great writers who preceded the French Revolution were teaching the abolition of privilege and of religious persecution. Although neither Voltaire nor Bayle wrote in a kindly spirit of the degraded Hebrew race, the general tendency of their teaching was in the direction of toleration, and so it happened that, just at the moment when the Jews were become more than ever willing and ready to enter into the national life of Germany, the country was being prepared to receive them. The civil restrictions were only gradually abolished; painful revivals of hatred recurred from time to time, but henceforth the name of Jew grew year by year to mean less a distinction of nationality, and became more exclusively a denomination referring merely to ancestry and religious belief.

Among the friends and disciples of Mendelssohn who continued his work were Wessely (the father of modern Hebrew poetry), David Friedländer (founder of the Jews' Free School in Berlin), Joel Löwe (professor at the Jewish Wilhelmschule in Breslau), Herz Homberg (tutor in the house of Moses Mendelssohn, and inspector of German schools of the Jews in Galicia), Aaron Wolfsohn (teacher at Breslau), Baruch Lindau (writer on physics), Marcus Herz (Mendelssohn's family doctor, whose more famous wife, afterwards converted to Christianity, received at her house a brilliant society, the two Humboldts, Count Bernstorf, Gentz, and Börne), Isaac Euchel (translator of the Jewish prayer-book), Lazarus Bendavid (who was specially concerned with education). All these and others contributed to the Hebrew periodical *Meassef* ("The Gatherer"), published at Königsberg and Berlin, 1783–1790; Breslau, 1794-1797; Berlin, Altona, Dessau, 1809–1811. The activity of the literary period which followed appears from the long list of rabbinical reprints, some with valuable notes, or translations, issued immediately before the close of the 18th century from the Jews' Free School printing-press at Berlin, under the direction of Isaac Satanow.

From minimizing differences in religion some were led to give up their distinctive religion altogether, and adopt a nominal, sometimes a real, Christianity, and thus the famous names of Heine, Börne, Edward Gans the jurist, Rahel, the younger Mendelssohn the composer, and Neander the historian pass out of the scope of this article. These celebrated persons belong rather to the general history of German culture than to that of the race from which they sprang. Among the general body of the Jews, the removal of political restrictions and a closer communion with modern thought worked noticeable, though less radical, changes. The old system of preaching in the synagogue was revived, and led to the excision of some of the interminable prayers and sacred poems which the piety of preceding ages had accumulated in embarrassing profusion. After the establishment of the consistory in the (French) kingdom of Westphalia, German lectures were held in Cassel, Dessau, Berlin, Hamburg, etc.; and now there is scarcely anywhere an important Jewish community without a preacher. Organs were introduced into some synagogues. The alterations brought about disputes in several communities and even secessions, as at Hamburg in 1819. In Prussia the Government, acting on the principles urged in Mendelssohn's time by his friend Dohm, but vigorously combated by the Jewish philosopher, gave the sanction of state authority to the resolutions of the orthodox. The private synagogue founded in Berlin by Israel Jakobsohn, after the breaking up of the Westphalian consistory, on principles similar to those of the reformed Hamburg Temple, was closed, and suffered the same fate when reopened as a public synagogue in 1817 and again in 1823. Even choirs and sermons were prohibited as un-Jewish innovations. Such regulations tended to disgust many educated persons who might otherwise have continued to remain attached to the faith of their fathers. They felt themselves isolated in the midst of their less advanced brethren, and were tempted to identify themselves even in religion with their more cultured Christian associates. Besides, a change of faith offered an escape from humiliating legal restrictions, and opened the way to more dignified careers than those permitted to the conforming Jews. The smaller German states appointed rabbis who were more or less state officials. When the Government restrictions were removed, considerable divergences manifested themselves, which the assemblies of rabbis and synods, beginning in 1844, and continued from to time to the present day, did little to heal. There now exist in most German towns an orthodox and a reform congregation, which differ in their mode of conducting public service, in the prominence given to the belief in the Messiah and the return to the Holy Land, and in their greater or less adherence to the laws of the Sabbath, and laws concerning diet, etc. One reformed congregation in Berlin keeps the Sabbath on the first day of the week.

More remarkable examples of sectarian dissent were the movements known by the names of Sabbathai Zebi, of Frank, and of the Chasidim. Sabbathai's career had Turkey for its theatre, but the influence of his strange pretensions was felt in Poland and Germany, as well as throughout the East. Sabbathai Zebi was born at Smyrna in 1626. He announced himself the Messiah in Jerusalem, named his brothers kings of Judah and Israel, took the title for himself of king of the kings of the earth. Miracles were related of him; from Poland, Hamburg, and Amsterdam treasures poured into his court; in the Levant young men and maidens prophesied before him; the Persian Jews refused to till the fields. "We shall pay no more tribute." they said, "our Messiah is come." The pretender, whom so many unhappy people were ready to acclaim as their deliverer from unendurable evils, afterwards embraced Mahometanism to escape death from the Porte. Some of his followers went over with him to Islam; others treated his conversion as forced, and still proclaimed themselves Jews and his disciples. Their faith was nearer to immortality than their Messiah, and he was still believed in and his return expected after his death. Out of the wrecks of the Sabbathaic party Jacob Frank formed in Podolia the Zoharites, whose Bible was the Cabbalistic work called *Zohar*. Persecuted by the orthodox, he put himself under the protection of the bishop of Kaminiek, and burnt the Talmud in public. When his protector died he migrated with hundreds of followers, and afterwards lived in royal state at Vienna, Brünn, and Offenbach, ending by becoming a Roman Catholic. He died in 1791, and his sect perished with him. Very different was the fate of the Chasidim ("the pious"), who preceded Frank and have survived him. They also swear by the *Zohar*, and revere as their founder Israel Baal Shem ("possessor of the wonder-working name"), or Besht, who flourished at Miedziboz in Podolia in 1740. Besht pretended to be the promised child foretold by the prophet Elijah, and named by him Israel before his birth. A long sojourn in solitary places, much fasting and physical torment, the tortures of rolling in thorns in summer and of bathing in half-frozen rivers at midnight in the winter, gave this prophet the faculty of seeing visions, the power to heal diseases, and to release souls held captive in the bodies of brutes. Like the older Kabbalists he treated the Talmud with contempt; he exhorted his followers not to lead a gloomy ascetic life, but praised gayety and enjoyment as tending to a career agreeable to God. Joyful religious worship was to be induced by drinking, jumping, clapping of hands, making noises and screaming, to which were added ablutions according to the fashion of the Essenes of old, and the wearing of a peculiar dress. Amongst his followers many found out how to derive advantage from the superstition and ignorance of the masses. Dob Beer (Berush) of Mizricz seldom showed himself but to his disciples, and had reports of his wondrous works spread by them; many sick and lame went to him for cure; offerings of money came in and supplied the Zaddik with means to lead a princely life. The Chasidim still flourish in Russia and Jerusalem, and the Zaddikim (or "righteous") and Rebbés, as their leaders are called, live in magnificence upon the contributions of the most ignorant of the people.

While this and cognate heresies were driven back into the overcrowded Jewish communities of Russia and Poland from which they came, in Germany Talmudic studies were pursued with undiminishing zeal, though carried on in gradually narrowing circles, and largely owing to the knowledge of the Talmud being a qualification for appointments in large congregations. Gradually the Talmud, which had been once the common pabulum of all education, passed out of the knowledge of the laity, and was abandoned almost entirely to candidates for the rabbinate. In the earlier part of this period, the rabbis received their education at the Yeshiboth ("sessions" of academies devoted to the Talmud, the *Shulchan Aruch*, and their commentators). As the spirit kindled by Mendelssohn penetrated the various sections of the Jews, it was felt that this mode of instruction would not suffice, and institutions were founded, not confined exclusively to these studies, but embracing the whole domain of Hebrew theology, philosophy, and history. Jonas Fränkel in 1854 established the Judæo-theological seminary at Breslau, an institution which has provided Germany and Austria as well as England and the United States with many rabbis. Its first director was Zacharias Fränkel (1801–1875), predecessor of Graetz in editing the *Monatschrift*, and author of works on the Septuagint, the Mishna, and the Talmud of Jerusalem. Of later date are the high school for the study of Judaism, founded in 1872, and the "seminary for rabbis for orthodox Judaism," under Dr. Hildesheimer, established at Berlin in 1877. Israel Jakobsohn, president of the Westphalian consistory (1768–1823), did good service in improving teaching. He founded in Seesen (Brunswick) an educational and normal institution, bearing his name, for Jews and Christians, which still flourishes. A similar college was instituted by his brother-in-law Isaac Samson, and directed by S. M. Ehrenberg, amongst whose pupils were Jost and Zunz. Schools of a more elementary character were the Berlin Free School, already referred to, and others. In Dessau, Moses Mendelssohn's birthplace, the free school fostered by the duke, and called after him Franzschule, flourished under David Fränkel (1779–1865), editor of the journal *Sulamit;* in Frankfort-on-the-Main was the Philanthropin, now converted into a technical school. In almost all Jewish communities we now find institutions teaching religion. After a first and unsuccessful attempt, Dr. Moritz Veit founded a normal school, which existed under Zunz in Berlin from 1840 to 1852, and was revived by Dr. Veit and the famous preacher and author Dr. M. Sachs. Similar schools were founded in other places—Hanover, Münster, Düsseldorf, Cassel,—with more or less success. The union for the culture and science of Judaism (1823) and the Culturverein had a brief existence. Instead of receiving support and thanks, the chief workers were regarded as heretics.

The modern historical study of Judaism was inaugurated by Rapoport and Zunz. Solomon Juda (Löb) Rapoport, sprung from an old family boasting many learned Talmudists, was born in Lemberg in 1790, and was rabbi at Tarnopol and in Prague, where he died in 1867. His published essays in various periodicals or in the form of prefaces are largely biographical, and display a great range of reading and power of combining distant references. Of his projected Talmudic encyclopædia but one part appeared, and his scheme for a biographical series under the title of *Men of Renown* remained unrealized, except some fragments. Nachman Krochmal (1780–1840) was not less learned than Rapoport, and perhaps surpassed him in philosophical acuteness.[1]

Of greater importance and influence were the writings of the patriarch of living Jewish scholars, Leopold Zunz, especially his epoch-making work *Die Gottesdienstlichen Vorträge der Juden* (Berlin, 1832).[2] Among other historical writers may be named Isaac Marcus Jost (1793–1860), teacher in the Jewish normal school at Frankfort, editor of a valuable edition of the Mishna with a German translation (1832–34), and author of several important histories of Judaism and its sects, A. GEIGER (*q.v.*), and H. Graetz of Breslau, who has composed the most comprehensive history of the Israelites that has yet appeared. To the names of these scholars may be added FÜRST the lexicographer (*q.v.*), M. Steinschneider the bibliographer, Herxheimer the translator of the Bible (*Pent.*, 1841; *Proph. and Hag.*, 1841-48), and Herzfeld the historian (*Gesch. d. V. Jis.*, 1847). In modern German-Jewish literature Philippson of Bonn and Lehmann of Mainz are leading representatives in journalism of reform and orthodoxy. German Jews have also distinguished themselves in general public life, claiming such names as Lasker in politics, Auerbach in literature, Rübenstein and Joachim in music, Traube in medicine, Lazarus in psychology. Especially famous have been the Jewish linguists, pre-eminent among whom are T. Benfey of Göttingen (1809–1881), the most original of modern comparative philologists and the greatest Sanskrit scholar of our day, and the admirable Greek scholar and critic Jacob Bernays of Bonn (1824-1881).

Within the last year or two the success of the Hebrew race in commerce and the professions has led in Germany to a singular revival of old-world prejudices. A series of leagues of "Germans" were formed against the "Semites." Stöcker, a "Christian Socialist" and court preacher to the emperor, gave importance to the movement by placing himself at its head. Its weapon is social ostracism; meetings are held at which the Jews are loudly denounced; and members of the "German" leagues vow to have no commerce with the hated race. Occasionally the two parties come to blows, some Jewish houses were wrecked, and a Synagogue at Neu-Stettin burnt. At this point the Government interfered.

The universal admission of the Jews to public posts only dates from the establishment of the empire. In the German states the spiritual emancipation of the Jews was not immediately followed by political emancipation. They were freed in Germany by the French law as a result of the conquests of Napoleon, but lost their civil equality when the French retired, to regain it bit by bit in succeeding years.

The Leibzoll, the odious tax imposed upon a Jew as often as he crossed the boundary of a city or petty state, even if he went in and out twenty times in the day, was removed in Prussia in 1790, and in other German states in 1803. In 1812 the royal edict declared all Jews in Prussia to be citizens, and gave them equal rights and privileges with their Christian fellow countrymen. They fought in the war of liberation, but after its success there was a reaction, and the new privileges (more particularly free admission to academic posts) were in part withdrawn. The Jews who had been promoted to the rank of officers during the war had to quit military service to escape the degradation of losing their commissions. The national parliament, which met at Frankfort in 1848, adopted resolutions in favor of the removal of religious disabilities. The Prussian constitution of 1850 declared that the enjoyment of civil rights was independent of religious confession. The legislation with which the empire was inaugurated in 1871 at length gave political and civil equality to the Jews throughout Germany.

---

[1] His fragmentary works were collected by Zunz, under the title *More Neboche ha-seman*, 1851.

[2] A collected edition of Zunz's scattered essays was commenced by the "Zunzfund" in honor of his eightieth birthday, 1874.

The number of the Jews in the German empire is now 520,575, or 1 per cent. of the whole population (census of 1875). The Gemeindebund, or union of congregations for some religious and charitable purposes, has recently been established at Leipsic. The Jews are engaged in all the occupations which other citizens pursue in Germany. While they show a marked predilection for and success in commerce and the learned professions, a few are farmers and sailors. Being subject to the ordinary military laws, they serve in the army, and many Jews hold commissions in those regiments in which noble descent is not a necessary qualification.

France.

While the spiritual awakening of the Jews was essentially a German movement, having its centre in Prussia, the most powerful impulse to their political liberation came from France. The Jews had been banished from France by Charles VI., but a few had returned. Some Portuguese fugitives had taken up their residence at Bordeaux and Bayonne. Others had settled at Avignon under papal protection, and at Carpentras there was a congregation with a liturgy in some respects peculiar. To Paris the Jews began to return in 1550, but held the privilege of domicile by a precarious tenure till Pereyre, the founder of the institution for deaf mutes, obtained in 1776 formal confirmation of the leave given to the Portuguese Jews to reside in the capital. There were already several hundred German Jews resident in an unlawful way, and protected chiefly through the influence of a German Jew named Calmer, who had been naturalized for services to the Government. The conquest of Alsace had added largely to the Jewish subjects of France. In 1780 the Alsatian Jews presented to the king a petition complaining of the seignorial dues exacted of them, of the restrictions on their trade, and the efforts of the priests to convert their children. The complaint was not without effect. The capitation tax was abolished in 1784, projects of enfranchisement began to be broached, and a commission was appointed for the revision of the laws about the Jews, but its work was interrupted by the Revolution. The Jews addressed themselves with better hopes to the national assembly, and those of Paris distinguished themselves by demanding the withdrawal of the authority of the synagogue over its members. In 1790 the French Jews united in sending into the assembly a petition demanding their admission to full and equal rights with other citizens. This requisition at first met with some serious opposition even among the advocates of universal liberty; the ancient prejudice against this people had not been entirely eradicated. But the exertions and influence of Mirabeau and Rabaut St. Étienne prevailed. In 1790 the Portuguese Jews, and in 1791 the whole Hebrew population of France, were admitted to complete rights of citizenship. The constitution of 1795 confirmed the declarations of the assembly. The gratitude of the Jews was shown by their patriotic devotion in the wars of the Revolution.

One of the most remarkable events in modern Jewish history was the convocation of the Sanhedrin (Synedrion) by Napoleon. It was preceded by the session of a general assembly of one hundred and eleven delegates, held in Paris in 1806 under the presidency of Abraham Furtado, merchant, author, and scientific agriculturist, the delegate of the Portuguese congregation in the port of the Gironde. To this assembly twelve questions were submitted by the emperor, and its principal answers were afterwards confirmed and formulated in nine propositions of law by a Sanhedrin formally elected by the synagogues in France and Italy. The Sanhedrin commenced its sittings on February 9, 1807, under the presidency of Rabbi David Sintzheim of Strasburg, with a Piedmontese rabbi as first, and an ex-legislator of Italy as second assessor. The forms of the old Sanhedrin were observed as far as possible; the responses are couched in the form of statutes binding the constituents of the Sanhedrin, and these decisions have usually been treated with much respect even by communities which sent no delegates, while the Jews of Frankfort and Holland formally accepted them.

The following are the nine decrees:—(1) polygamy is forbidden, according to a decree of the Synod of Worms in 1050; (2) divorce is allowed to the Jews if and so far as it is confirmatory of a legal divorce pronounced by the authority of the civil law of the land in which they live; (3) no Jew may perform the ceremony of marriage unless civil formalities have been fulfilled,—intermarriages with Christians are valid civilly, and, although they cannot be solemnized with any religious celebration, they involve the parties to them in no ban; (4) the Jews of France recognize in the fullest sense the French people as their brethren; (5) acts of justice and charity are to be performed towards all mankind who recognize the Creator, irrespective of their religion; (6) Jews born in France and treated by its laws as citizens consider it their native country,—they are bound to obey the laws of the land; Jews are dispensed from ceremonial observances during service in the army; (7) the Sanhedrin exhorts the Jews to train their children to laborious lives in useful and liberal arts, to acquire landed property as a means of becoming more firmly attached to their fatherland, to renounce occupations which render men odious and contemptible in the eyes of their fellow-citizens, and to do all in their power to acquire their neighbors' esteem and good wishes; (8) interest is not allowed to be taken when money is lent for the support of a family, but interest is permitted when money is lent for commercial purposes, if the lender runs any risk, and if the legal rate is not exceeded; (9) the above declarations concerning interest, and the texts of the Holy Scripture on the same subject, apply between Jews and fellow-citizens in precisely the same way as between Jews and Jews. Usury is altogether forbidden. At the close of the Sanhedrin, the emperor established the consistorial organization which in its main features still exists in France. Every two thousand Jews were to form a synagogue and a consistory consisting of one chief rabbi, and two rabbis with three laymen householders belonging to the capital town of the consistory. Bankrupts and usurers were excluded from the consistory, which was to watch over the conduct of the rabbis, to maintain order in the synagogues, and to admonish the Jews of the district to follow handicrafts and obey the laws of the conscription. The central consistory, sitting at Paris, had power to appoint and depose the rabbis. The rabbis were to publish the decrees of the Sanhedrin, to preach obedience to the laws, and to pray in the synagogues for the imperial house. Many Hebrew hymns of praise were composed in honor of the despot who had framed this organization, although at the same time the emperor issued a decree which made considerable concessions to the popular prejudices against the Jews in Alsace and eastern France generally, forbade the Jews to change their domicile or enter into occupation without special permission, framed stringent precautions against usury, and excepted the Alsatian Jews from the right to provide substitutes for military service. The laws of 1814, 1819, and 1823 made some beneficial changes in the position of the Israelites, and in 1829 Charles X. established at Metz a central school for the instruction of candidates for the rabbinate. It was subsequently removed to Paris. In 1831 the Government definitely decided, in accordance with the ideas of Napoleon, that the rabbis should be state functionaries. From that year they have been paid by the state. In 1833 the French Government suspended relations with a Swiss canton which had denied equal rights to a French subject on the ground that he was a Jew.

In France the absence of political restrictions has been unfavorable to the separate development of Judaism. The ministers Crémieux (1796–1879), Fould, and Goudchaux, the archæologists and philologians Jules Oppert and Halévy and the Darmesteters, the composer Meyerbeer, and many others, are well-known names in the general history of their country. Many Israelites have occupied high civil and military posts. Other Israelites by race have become indistinguishable by religious practice from the main body of the citizens; and the principal contributions in France to Hebrew literature have been from writers born in Germany, like Munk (1802–1867) and Derenbourg, like Samuel Cohen and Franck.

Before the year 1860, an outbreak against the Jews in Russia, the accusations at Damascus, the Mortara abduction case in Italy, and about this time the sufferings of the Jews in Morocco, had vividly excited the sympathies of the Jews in western Europe; they had joined together to make contributions of money for relief of distress at Königsberg and in the Holy Land, and had even made representations to the Governments of the various countries in which they resided in order to bring political means to bear to alleviate the fate of their unfortunate co-religionists. An English Jew, Sir Moses Montefiore, took the lead in these efforts. But there was no regular provision for prompt and concerted action in defence of outlying and oppressed communities of Jews till, in 1860, an organization was established in Paris which was destined to exert a permanent watchfulness over the oppressions practised in the less civilized countries upon Jews, as well as to improve the backward communities of Hebrews by education. This was the Alliance Israélite Universelle, which on January 1, 1881, had 24,000 subscribers in all parts of the world, though Israelites are by no means unanimous in supporting it.

The connection between the local committees and the central body is not very intimate, but a correspondence is constantly kept up, and subscriptions for public objects flow from one to the other according to their respective wants and wealth. The Alliance and similar societies of a more strictly national character which exist in London and Vienna made representations at the Berlin conference in 1878, and helped to procure some alleviations of the state of the Jews in Roumania and Servia. The exertions of the same bodies had previously arrested, by making them known to Europe, the atrocities practised upon the Roumanian Jews in 1872. Similar action was brought to bear at the Madrid conference in 1880 in favor of the Jews in Morocco. Another part of the work of the Alliance is to maintain or assist schools for boys and girls in North Africa and in the Turkish empire, etc. In this task it co-operates with the Anglo-Jewish association formed for similar objects in England, the Board of Deputies in London, and the Alliance in Vienna. The Alliance has also an organization for apprenticing Jewish children to useful trades in eleven Eastern towns. Other Jewish public institutions at Paris are the rabbinical seminary under chief rabbi Wogue, schools and an industrial school for girls, the hospital founded by the late Baron James de Rothschild, the orphanage established by the late Baron Salomon de Rothschild, the ladies' committee and house of refuge, a central committee for Jerusalem schools, the society of Talmudical studies, and many burial and mutual aid societies. At Lyons and Marseilles there are similar institutions.

The distinction between reform and orthodox congregations, which has been noticed in Germany, and reappears elsewhere, is not found in France. The older distinction between the Spanish and Portuguese Jews (Sephardim) on the one hand, and the Polish and German Jews (Ashkenazim) on the other, is, however, still made. They have different synagogues, in which a somewhat different ritual and a different pronunciation of Hebrew are employed. No doctrinal distinction, however, exists between the two divisions, and they now freely intermarry and associate with each other, although at their first meeting in France and England, about a century ago, and for some time later, the rich and polished emigrés from the south refused to mix with their uncultured northern brethren. The Jews of German rite are now much more numerous and wealthy in western Europe than the Sephardim.

The number of Jews in France in 1880 was about 60,000, of whom 34,000 were in the consistorial circonscription of Paris, 8800 in that of Nancy, 2200 in Lyons, 4000 in Bordeaux, 2200 in Bayonne, 4000 in Marseilles. The Jewish population in France (including northern Italy, and Treves, Mainz, Coblentz, etc.) in 1808 was 77,000; it had risen to 158,994 (without including Italy or Treves and its sister cities) when the census of 1866 was taken, but fell to 49,439 in the census of 1872, owing to the loss of Alsace-Lorraine, the part of France in which the most numerous Jewish population existed. The Jewish inhabitants of the Paris circonscription were in 1808 only 3585 in number, about a tenth of their number in 1880. Two Jewish newspapers are published in the French language at Paris, and one at Avignon. The Jewish population of Algeria in 1880 was (according to the *Annuaire Israélite*) 72,800, of whom 52,000 were in the consistorial circonscription of Oran. These figures show a large increase in the population in recent years. M. Crémieux by a stroke of the pen obliged the Israelites in Algiers to become French citizens, a step that had previously involved certain formalities which their conservative feeling resisted. The measure, however, led to an outbreak of the Arabs. In Versailles exertions were made to cancel it, and its operation was suspended, but finally the decree was sustained, and the Jews, who form the class among the native population most fitted for civilization, retain the franchise.

England.

The Jews were readmitted into England by Cromwell on the application of Manasseh ben Israel; and the Spanish and Portuguese Jews from Amsterdam took a lease of ground for a burying-place at Stepney, in February, 1657. The first recorded interment was in 1658. The city of London, which was afterwards to aid so powerfully in the emancipation of the Jews, petitioned the council in the first years of the restoration to remove the competing Jewish merchants, but, this and other petitions being unsuccessful, a synagogue was built and the copyhold of the cemetery was acquired, although up to fifty years ago doubt was sometimes expressed whether Israelites even if born in the country could hold land in England. The right of Jewish charities to hold land was clearly established by an Act passed in 1846. The Jews were too few in number to be visited with special disabilities, but suffered from the general operation of the Tests Acts, which excluded them from political, civil, and municipal offices, from the bar, etc., and could be invoked to prevent them from voting at parliamentary elections. Jacob Abendana and David Nieto are rabbinical writers who flourished in England in the 17th and early in the 18th centuries. In 1725, Sarmento, a mathematician, was (like Gompertz and others after him) made a Fellow of the Royal Society, Emanuel Mendes da Costa was secretary and librarian of the society a few years later (died 1769). Sir Solomon Medina financed the commissariat in the duke of Marlborough's campaigns. But the Sephardic immigration is best known by the converts to Christianity whom it supplied, as Isaac Disraeli, and his son Lord Beaconsfield (who was baptized at the age of twelve), David Ricardo, the Lopes family, and others. Conversion to Christianity was encouraged by a statute of Anne (repealed in 1846), which compelled Jewish parents to make an allowance to their children who embraced the dominant faith. German Jews began to immigrate in large numbers after the accession of the house of Hanover. English statesmen soon perceived what important contributions the business ability of the Jews was capable of rendering to the wealth of the country in which they settled, but the enlightened appreciation of the governing class was long in making its way among the electors. In 1753 Mr. Pelham passed his Jewish Naturalization Act, which was repealed the next year owing to popular clamor, "No more Jews, no wooden shoes," becoming as influential a refrain as Lilliburlero. This premature emancipation supplied an argument which afterwards assisted to retard the political liberation of the Jews. The Jews were excepted from the benefit of the Irish Naturalization Act in 1783; the exception was abolished in 1846; in that year also the obsolete statute De Judaismo, which prescribed a special dress for Jews, etc., was formally repealed. It had been disregarded ever since the return of the Jews under Cromwell. The Reform Act of 1832 gave the right of voting for members of parliament in all constituencies to Jews who possessed the property or other qualification required. Mr. Robert Grant, M. P. for Inverness, in 1830 proposed to admit Jewish members to the House of Commons, Mr. Huskisson having previously presented a petition asking for this concession.

The bill was carried on the first reading by eighteen votes, but lost on the second by sixty-three. The Board of Deputies had been appointed in 1760 to watch over the interests of the "Portuguese nation," as the Sephardic Jews called themselves in England and France; it was shortly afterwards joined by delegates of the German congregation, and now represents the orthodox congregations in the principal towns of the United Kingdom. Through this board the House of Commons was frequently petitioned in the next thirty years to grant political equality to the Jews, and the claim was supported by eminent statesmen, notably by Macaulay and by Lord Russell, the latter of whom brought in an annual bill on the subject. Baron Lionel de Rothschild was elected five times by the city of London before he was allowed to vote, and was eleven years a member of the House of Commons without taking the oath. Alderman Salomons was returned for Greenwich in 1851, and took his seat, spoke, and voted, having in repeating the oath omitted the words "on the true faith of a Christian." He was fined £500 by the court of exchequer, and was obliged to retire from parliament. The enabling bills had been passed year after year in the House of Commons, but as often rejected by the Lords, until in 1858 a compromise was effected, and Jews were permitted by the joint operation of an Act of Parliament and a resolution of the House of Commons to omit on taking the oath required of a member of the Lower House the words to which they conscientiously objected. In 1866 and 1868 Acts were passed which prescribed an oath in a form unobjectionable to Jews to be used in the Houses of Lords and Commons alike, but no Jew by religion has yet been raised to the peerage. Remarkable legislative provisions in favor of the Jews are the exceptions by which they have enjoyed since 1870 under the Factories Acts the right to labor on Sunday in certain factories if they rest on their own Sabbath. Till 1828 only twelve Jewish brokers were permitted to carry on business in the city of London, and the patent was purchased for large sums when vacancies occurred. No Jew could open a shop in the city till 1832, because that permission was only accorded to freemen. Even baptized Jews were not admitted to the freedom of the city between 1785 and 1828. The first Jewish sheriff of London, Sir D. Salomons, was unable to take the oaths till a special Act was passed by Lord Campbell in 1835, and, although he was followed two years later by another Jewish sheriff, Sir Moses Montefiore, it was not until ten years after his election as alderman that Lord Lyndhurst's Act (1845) enabled him to perform the duties of that office. Among the names of Jews in England distinguished in science and literature are the mathematician Sylvester, the Sanskrit scholar Goldstücker, and the Orientalists Zedner and Deutsch. The first Jewish barrister (Sir F. Goldsmid) was called to the bar in 1833.

The Jews' Free School in London is probably the largest and most efficient elementary school in England. Two Jewish newspapers are published in London. The Jewish community in England maintains many charitable and other public institutions. The most important are the boards of guardians in London and Manchester, which are chiefly occupied in the relief of penniless emigrants from Russian Poland. Dr. Benisch, the late editor of the *Jewish Chronicle*, founded in 1871 the Anglo-Jewish association to co-operate with the Alliance Israélite of Paris, which has been already described. The association has nearly 3000 members, chiefly in England and the colonies, but also at Alexandria and Tangiers. The Jews' college in London and the Aria college at Portsea are designed for the training of ministers and teachers. Three societies for the promotion of Hebrew literature have been formed. The only one which still exists is the Society of Hebrew Literature, to which Christian scholars have contributed equally with the Jewish students of the same subject. The principal religious movement has been the formation of the West London congregation of British Jews, a body of dissenters, who have simplified the ritual, only keep one day of the festivals, and do not acknowledge the spiritual ascendency of the chief rabbi. They seceded in 1840. Congregations at Manchester and Bradford worship with the same rites. The Sephardim and Ashkenazim still differ in liturgy and in pronunciation of Hebrew. The principal London synagogues of the latter body were federated by private Act of Parliament in 1870 under the name of the United Synagogue, which now consists of ten London congregations. Its liturgy was modified in the direction of brevity in 1880. Forty provincial orthodox synagogues are recognized by the Board of Deputies, which under the Marriage Acts certifies the secretaries of orthodox synagogues entitled to register marriages.

The Jewish population of Great Britain is estimated (in the absence of a census by religions) to be 52,000, of whom 40,000 are reckoned to be in London. There were 453 Jews in Ireland at the census of 1881.

In the British colonies Jews are numerous and their congregations flourishing. There are nearly 2000 Jews in Gibraltar, who carry on an active commerce with their brethren in Morocco, sending Manchester and Sheffield goods, and receiving corn, hides, and other produce. Their settlement dates from the British occupation in 1704, which allowed the unhappy Spanish refugees in Morocco to return to a corner of Spain. Jews have been law-officers, ministers, members of the legislatures, and magistrates in the Australasian colonies, Cape Colony, the West Indies, etc. In Victoria there were 3571 Jews in 1870, and a Jewish newspaper is published at Melbourne; in West Australia there were 62 only in 1870; in Tasmania they formed only 0.23 per cent. of the total population of 99,328.

A remarkable settlement exists in Bombay under the name of the Beni Israel. They are 5000 in number, and are for the most part artisans, some of them soldiers. They support a school to which the Anglo-Jewish association in London and Manchester contributes. The Beni Israel have a tradition that they were shipwrecked on that coast more than one thousand years ago. They have always strictly observed the Sabbath, refraining from cooking their food or doing any other work on that day. They do not eat unclean fish or flesh; they observe the great feasts, and have a Jewish type of countenance. The Beni Israel are found not only in Bombay itself but in other towns on the coast not beneath the direct rule of the Bristish Government. They relate that David Rababia, a Jew either of Baghdad or Cochin, came to that part of India about nine hundred years ago, and, having discovered that the Beni Israel were observing the Jewish code, was convinced of their Jewish origin, and established a Hebrew school. Before his death he gave a written order to two of his scholars to succeed him as religious ministers. This office has been retained to this day by their descendants. These ministers are called kajees, and are considered superior to the ordinary religious ministers who receive payment for officiating in the synagogues. They are in some respects like high priests and civil heads of the community; and in the outlying villages ecclesiastical and civil matters are investigated and settled by them with the aid of a council. With these kajees may be compared the cohanim (priests) in the Western Jewish communities, who are reputed to be descendants of Aaron, and enjoy the prerogative of blessing the people, and a certain precedence in synagogue, to the exclusion of ministers who are not of the same lineage. In Bombay judicial and other civil functions for the Beni Israel are performed by a person called Nassi or head, aided by a council. The Beni Israel have been settled in Bombay itself for upwards of one hundred and fifty years. Their first synagogue was built in 1796 by Samuel Ezekiel, a native commandant in the British army sent against Tippoo Sahib. The Sephardic daily prayer-book, Dr. Hermann Adler's sermons, and some other works have been translated by the Beni Israel into Marathi. Some of them know Hebrew, although Marathi is their ordinary language, and their knowledge of Hebrew is probably rather due to frequent intercommunication with the Jews of Baghdad and Europe than to independent tradition. The Beni Israel rarely intermarry with the ordinary Jews. They have a literature in Marathi. They tie a golden band ("munny") with black glass beads round the bride's neck during marriage to show that the bride is a married woman; when she is stripped of it she is considered a widow. They say that they adopted the title of Beni Israel because that of Jehudim or Jews was hateful to the Mussulmans. The Baghdad and Cochin Jews attend their synagogues and eat with them, and *vice versa*. They have among them a class of Beni Israel whom they designate Kala Israel or Black Israel. Between them and the white Beni Israel no intermarriages are ever solemnized. They are descendants of Beni Israel by heathen wives, or are proselytes or their descendants. They have separate burying-grounds.

The Jews of Cochin, found in that British port of the

Madras presidency and elsewhere on the Malabar coast, have the tradition that they arrived at Cranganore in the sixty-eighth year of the Christian era, and received a written charter from the native ruler, and that when the Portuguese came they suffered oppression and removed to Cochin, where the rajah granted them places to build their synagogues and houses. They again suffered from the Portuguese, but the Dutch conquest in 1662 gave them protection. At Cochin there are black and white Jews. The white Jews consider themselves as immigrants from Palestine. The black Jews are regarded as proselytes and emancipated slaves of the white Jews. The black and white do not intermarry with each other, and the black Jews do not observe all the ceremonies of the law.

Austria.

The history and condition of the Jews in three important countries and their colonies having been somewhat fully sketched, a shorter account of their situation elsewhere will be sufficient. The Austrian Jews participated in all the intellectual movements of their brethren in Germany. Their chief writers are Kompert (the brilliant author of *Tales of the Ghetto*), Frankl the poet, G. Wolf, historian, Mosenthal, dramatist, Dukes, Kayserling, Mannheimer, Jellinek, Güdemann, Kaufmann, Letteris. The chief training establishment for rabbis is the Budapest seminary established with the proceeds of the fine imposed upon the Jews for participation in the insurrection in 1848. Austria was long notorious for ill-treatment of the Jews, but Joseph II. made in 1783 a new departure in his policy towards this class of his subjects. He abolished the Leibzoll, night-notices, passport regulations, and gave the Jews permission to learn trades, art, science, and, under certain restrictions, agriculture. The doors of the universities and academies were opened to them. He founded Jewish elementary and normal schools, and also compelled the adults to learn the language of the country. In spite of these reforms, considerable restrictions were still imposed upon the Jews with regard to right of residence, etc., and the successors of the philosophic emperor, Leopold II. and Francis I., restored many of the old humiliating regulations. The Jews in Austria remained during the greater part of the present century subject to special restrictions. To remove from province to province they required the permission of the central Government. In many parts of the empire they were not allowed to rent or purchase lands beyond their own dwellings. The Magyar nobles, however, employed them largely as bailiffs, gave them great freedom of tenure, and actually fought under their lead as military officers in the struggle for independence. After 1848 the Jewish capitation tax was reduced except in Vienna; but, as many Jews had taken part in the revolutionary movement in Hungary, a heavy exaction was imposed upon them after its suppression. The reforms inaugurated by the constitution of 1860 for Austria and in 1861 for the rest of the empire, and completed in 1868, at length gave the Austrian Jews the freedom which they now enjoy, which makes them influential and respected in Vienna and the other great towns, and even in the backward province of Galicia a striking contrast to their less favored brethren in the neighboring country of Russian Poland. Several Jews, two of them rabbis, sit in the legislatures. The Israelitish Alliance was founded in Vienna in 1872. The number of the Jews in the empire of Austria-Hungary is 1,372,333, or more than 3 per cent. of the total population. Of the total number, 820,200 are found in Austria (including 575,433, or more than a tenth of the total population, in Galicia), and 552,133 in Hungary.

Italy.

In Italy, while Venice and Leghorn sheltered large and comparatively flourishing colonies, the Roman Jews had long an unenviable pre-eminence in suffering. Till 1847 they were not permitted to leave the Ghetto, and their conversion was sought by most oppressive means. It was in the papal states after this date that the young Mortara, secretly baptized by his nurse, was torn from his parents, and trained to be a monk. The kingdom of Italy brought freedom and political equality to the Jews. The most celebrated of recent Jewish scholars in Italy was S. D. Luzzatto (1800–1865). The rabbinical college at Padua, founded by J. S. Reggio of Görz (1784–1855), fell with the Austrian domination in 1866. The number of Jews in Italy was in 1876 estimated to be 53,000, of whom 5000 were in Rome, 2800 in Modena, 3000 in Venice, 2000 in Sicily, 7688 in Leghorn, 2500 in Turin, 2000 in Padua.

Greece.

The census of 1870 gave 2582 as the number of the Jews in Greece. They enjoy perfect freedom of worship, and live on terms of friendship and equality with their neighbors in the kingdom of Greece, although at Alexandria, Smyrna, and other towns of the Levant, quarrels sometimes occur between the two races.

Spain.

The liberal institutions established during the last few years in Spain have permitted the Jews to return to a country in which their ancestors enjoyed a glorious period of literary and social activity. In 1881 the Spanish representative at Constantinople was authorized to assure some distressed Jews who fled into Turkey to escape the persecutions of Russia that the Government of Spain would welcome them to that country, in which, he added, all Jews could now settle. At Seville Jewish worship is regularly held, and meat killed according to Jewish rites can be bought. At Madrid a congregation assembles on the most solemn fast in a private house.

Portugal.

Since the commencement of this century foreign Jews of Portuguese origin from Gibraltar and Africa have immigrated into Portugal and been permitted to solemnize religious service there. There are three synagogues at Lisbon and one in Oporto. On the Day of Atonement, unknown persons from a distance in the interior have been observed to join these congregations; they were members of Jewish families who had secretly preserved their religion and the tradition of their origin during the whole time of the exclusion of the Jews from Portugal. In 1821 the cortes abolished the Inquisition, and resolved that all rights and privileges which had been accorded to the Jews by former sovereigns should be renewed, and that all Jews who dwelt in any part of the world might settle in Portugal. About 1000 Jews reside in this country.

Holland.

In Holland, which was long the refuge of the Jews, and was the cradle of a flourishing Jewish literature, the Israelite immigrants were not entirely without restrictions, although Mendelssohn pointed to Amsterdam as a commercial paradise where all men were allowed free interchange of commodities. The 50,000 Jews of Holland, 20,000 of whom resided in Amsterdam, were first admitted to political equality in 1796, and the closer union with France which followed completed the work of liberation. At first this gift was not willingly received by the leaders of the Jewish community. They enjoyed great power over individuals, could levy large fines upon those members of the congregation who incurred their displeasure, and feared that the new duty of serving as soldiers and the new right of filling all the employments of the state would alienate their flocks. The Portuguese (or Sephardic) Jews, who were regarded as the aristocracy of their race, were especially conservative, and ultimately the discussions about emancipation led to the secession of the neoterizing party under the name of 'Adat Jeshurun. The number of Jews in Holland is now 68,000, to whom 665 may be added for Luxembourg.

Belgium.

In Belgium there are about 2000 Jews, who enjoy freedom and state subvention for their worship as in France.

Switzerland.

In Switzerland the Jews were long treated with great severity, and the French domination brought them only temporary relief. It was only in 1874 that full religious equality was conceded to the Swiss Jews. Their number is now 6996.

Denmark.

In Denmark the number of Jews does not exceed 4500. Since 1814 they have been eligible as magistrates.

Sweden.

The archives of the Sephardic synagogue in London contain a curious printed invitation from the king of Sweden, sent in the year 1746, in which wealthy Jews are invited to Sweden, while the poor are warned that their residence will be unwelcome. The London Jews declined this calculating hospitality. There are now 1836 Jews in Sweden, and an insignificant number in Norway.

Russia.

In Russia the Jews are more numerous and more harshly treated than in any other country in the world. From Russia proper the Jews were long and still are excluded, but the conquests of the Muscovites brought them face to face with large numbers of Israelites who, driven out of Germany by persecution, had taken refuge in Poland under the sway of Casimir the Great. The half Hebrew half German patois (Jüdisch-Deutsch) which Jews still speak in Russia and Roumania preserves this part of their history. A literature exists in this language: Journals are printed in it with Hebrew characters; theatrical representations are given in it, and two companies in London lately played dramas in it, in which the main point of the action was the misery of the religious Jew, who is dragged away from the study of his favorite Talmudical books to serve in the army, where he can hope, as a Jew, for no promotion. The flourishing factories, agriculture, and commerce of the Polish and Lithuanian Jews were wrecked by the intolerance of the successors of Casimir, and Russian oppression completed the ruin. The

Jews are still confined to a few over-populated provinces, and loaded with special taxes and restrictions. Under Alexander II. the condition of the Jews was in some respects improved, and the permission accorded for three Jews to settle at each railway station has enabled a few to escape from the old overcrowded settlements and find a new sphere for their commercial activity. They are still, however, largely at the mercy of the official class, and popular risings against them have been repeatedly permitted or encouraged. They are excluded from many vocations, or practise them only by the connivance of bribed officials. For some purposes they are still subject to the jurisdiction of the rabbis. Harkavy, Pinsker, Mandelstamm, Reiffman, and Levinsohn are among their most learned writers; Baron Günzburg is at the head of a society for spreading culture among the masses. In spite of their disabilities, there are among the Russian Jews enterprising contractors, skilful doctors, and successful lawyers. The number of Jews in European Russia was returned for 1876 as 2,612,179. In Russia in Asia they are estimated to number 25,000. For the KARAITES in Russia see that article.

Moldavia and Roumania.

At the beginning of the present century the Jews were found in Moldavia everywhere keeping the village inns and forming the centres for the commerce of their districts. Engaged in this occupation, or travelling through the country to buy or advance money upon the crops, and to sell foreign merchandise, were Jews, some of whom had come from Poland or Russia, while the families of others, resident chiefly at Bucharest, had been in the country from time immemorial. They also exercised many handicrafts. They were glaziers, locksmiths, tinmen, tailors, etc. The metal roofs and pinnacles of churches were all the work of Jews. In the great towns of Moldavia, and also in the Wallachian city of Bucharest, there were established wealthy communities belonging to both divisions of the modern Jews, Ashkenazim and Sephardim. Of the Sephardim or Spanish Jews it is known beyond a doubt that they settled in the country many centuries ago. They belonged to the families driven from Spain by the Inquisition. The principal bankers of Roumania are Jews. Their children have been in the habit of attending the same schools as the wealthy native families, and the parents held a good position in society. In Jassy, the principal city of Moldavia, 30,000 or 40,000 out of the 90,000 inhabitants are Jews. In 1804 the practice of the neighboring states began to creep into Roumania. In that year an ordinance of Prince Mourousi of Moldavia deprived the Jews of the right to hold farms except when attached to village inns. Since that time there have been a series of laws and edicts limiting the freedom of the Jews to hold land and engage in various professions and trades; the Jews have also had much to suffer from popular outbreaks, and even the treaty of Berlin, which abolished all incapacitation on grounds of religion, has been interpreted by the Roumanian Government as not applying to the Jews, who are regarded as foreigners, and only naturalized in small numbers and by special acts of the legislature. There are 200,000 Jews in Roumania, and perhaps two or three thousand may have been admitted to naturalization.

Servia.

In Servia there are 2000 Jews. They have suffered from occasional orders of expulsion from the country districts, but on the whole their condition is comparatively favored, and they are believed to be on the eve of being admitted, if not already admitted, to political rights.

Turkey.

The Jews in European Turkey before the war which ended with the treaty of 1878 were estimated to number 72,000 (in Adrianople 15,000, Shumla 1500, Widdin 1200, Varna 300, Tatar Bazardjik 1050, Dardanelles 2000, Philippopoli 2100, Rustshuk 2500, etc.). There are some thousands in eastern Roumelia, and others in Bulgaria, who have been very fairly treated by the authorities of the new principality, having grants for their schools, etc. The exertions of Dr. Allatini of Salonica have provided the community of that town (25,000 to 30,000 persons) with excellent means of education. Here is published the *Epoca*, a Spanish newspaper in Hebrew characters, which recalls the fact that this, like so many of the Jewish communities on the shores of the Mediterranean, sprang from exiles from Spain. The Jewish population of Constantinople consists of about 30,000 souls. Most of the Jews are Sephardim. Two thousand follow the German rite, and are principally to be found in Galata. The Jews in Constantinople are chiefly engaged in traffic. They are governed by a caim-macam appointed by themselves, and salaried by the Government. There are forty-two synagogues in the suburbs. Besides the schools of the Alliance, there are 2287 pupils in the wretched Talmud Torah schools. There are also three infant schools. The number of Jews in Asiatic Turkey is stated to be from 106,000 to 130,000. The Smyrna Jews number 25,000. In Baghdad, where there are 30,000 Jews, and where the wealthy family of Sassoon first became known, there are twenty-one synagogues. Pilgrimages are made to the tombs of Ezra, Ezekiel, Joshua the priest, and Sheikh Isaac. There are 500 families in Aidin, 400 in Magnesia, 250 in Casaba, 130 in Pergamos, 516 in Canea in Crete, 200 in Candia, 1200 in Beyrout, 2000 in Damascus, 10,200 in Aleppo. Outbreaks of religious hatred between the Greeks and the Jews, and even between the Mahometans and the Jews, have occasionally occurred at Smyrna, Rhodes, etc. The Jews on each occasion have been accused of using Christian blood at the passover. The falsity of this charge was publicly established in 1840, owing to the efforts of Sir Moses Montefiore, who journeyed to the East, accompanied by Crémieux and Munk, to vindicate the innocence of those of his coreligionists who had been put to death, and to liberate those who were imprisoned. The sultan then issued, at the request of Sir Moses Montefiore, a firman declaring the innocence of the Jews, and their title to his equal protection. They now suffer under no disabilities, and are admissible to office.

Palestine.

There are 15,000 Jews in Jerusalem (forming half the population), whose chief occupation is to study the Talmud. To maintain them in this hallowed indolence their brethren throughout the world send annual contributions (*haluka*) amounting to about £50,000 a year, or five-sevenths of the total revenue of Palestine. The rabbis who administer these large funds, and also wield the dreaded weapon of excommunication (*herem*), have set their faces against secular education, regarding Jerusalem as the one great rabbinical college of the world, where the contributors of the haluka fulfil the sacred duty of studying the law by proxy. Both Ashkenazim and Sephardim (whose leaders, more liberal than the Ashkenazim, permit Arabic to be taught), both Chasidim and Karaites, are represented here; the Sephardim dress as Orientals; the Russians and Poles wear their long silk or cloth gowns and fur caps, the Germans the quaintly cut coat and flattened wideawake of the early part of this century. All cultivate the long love-locks brought down in front of the ears in obedience to Lev. xix. 27. Boys often marry at fifteen, girls at thirteen. There are two weekly Hebrew newspapers. The synagogues are very numerous; around them cluster the Talmud schools. There are three hospitals for Jews, one of which is maintained by a Christian mission, numerous almshouses, of which the Juda Touro house is the principal, and several endowed schools. Jewish agricultural colonies have been formed at Lydda and elsewhere, and an excellent agricultural school at Jaffa receives thirty pupils. Jews are found at Hebron, Tiberias (1100 in number), Ramleh, Safed (5666), and elsewhere in the Holy Land.

Persia.

In the mountains of Kurdistan and on the plain of Urmiah there are Jews who speak an Aramaic dialect—"the language of the Targum." The Jews in Persia, as in many other countries, write their vernacular in Hebrew characters. They are engaged as peddlers in petty trades or in larger commerce, or enter into partnership with Kurdish farmers, to whom they supply capital, receiving half the produce. As a rule monogamy prevails, but exceptions are frequent when the marriage proves childless, or when the levirate law comes into operation. Jews settle their differences with each other by applying to the *malum* (*i. e.*, the rabbi) of the place, who together with his *beth din* forms the authorized court of justice. Boys are taught reading, writing, the Scriptures, and sometimes the Mishna. Every man and woman wears charms as safeguards against the evil eye, as protections both from ailments and from the attacks of enemies. The fear of infidelity is one of the causes which deter parents from letting their children learn secular subjects. Yet as each congregation requires the services of a *dayan* or religious chief, the necessity of cultivating some kind of knowledge cannot be entirely ignored. Persons desirous of pursuing a course of studies have had to resort to Urmiah and to Baghdad. There are ten synagogues, and 300 families in Teheran, partly engaged in skilled trades and professions. Jews are also found in Ispahan and other towns, etc. They are very poor, the majority in Ispahan being day-laborers and porters. The total number of the Jews in Persia is estimated to be 16,000.

Central and Eastern Asia.

In Bokhara (13,000), in Samarkand (10,000), in Merv, throughout Central Asia, Jews are scattered. The small colonies of Jews in Kai-fung-foo, Hansho, Ningpo, and Peking are regarded by the Chinese as a sect of Mahometans. They are termed Taou-Kin-Kedou ("separators of the sinew from the flesh.") These colonies, of ancient settlement, are not to be confounded with the European Jewish merchants, who under European protection now trade in the ports. The Jews of Kai-fung-foo have parted with their sacred scrolls, and their synagogues are ruined.

Arabia.

The Jews in Yemen have a long history, but the present Jewish population is stated by the latest observer (a correspondent of the Alliance Israélite, writing in 1881) to be only 15,000 in number. An older estimate (1876) made them number 200,000. They are chiefly found in Sanaa, the capital (where they are from 2000 to 3000 in number, and have thirteen synagogues under a Chacham Bashi), and also in the mountain villages. For upwards of eighty years the Jews of Senaa have been the victims of repeated persecutions, false accusations, and exactions; and until twelve years ago to these were added the duties of scavengers and night-men, imposed even upon the rabbis, and not redeemable by money payments. The assumption of sovereignty by the Porte much improved their position. They are artisans, laborers, and merchants.

Africa.

Wealthy Jews reside at Cairo (3000), others at Alexandria (where the odious blood accusations were recently revived against them) and Port Said. There are in all about 8000 Jews in Egypt.

In Abyssinia are found the Falashas, whose Jewish descent is doubted by some ethnologists. See FALASHAS, and Halévy in *Misc. Soc. Heb. Lit.*, 2d ser., vol. ii., 1877.

The Jews in Tripoli are estimated at 100,000. Tunis is variously said to contain 40,000 or 60,000 Jews. Those in the ports are European, chiefly Spanish, in recent origin. In the interior Jews live in tents, carry on agriculture on a communal basis, dress like their neighbors, bear long matchlocks, and rove from place to place like them; many, however, are goldsmiths. They conform strictly to the Jewish ceremonial laws.

The number of the Jews in Morocco was stated by the deputation which petitioned the British foreign office on their behalf in 1880 to be 300,000. There are 1200 in Larache, 1400 in Alcazar, 6000 in Tetuan, 8000 in Tangiers. Many are of Spanish origin. Jews have frequently been chosen in bygone times to represent the sultan as envoys. They now suffer from the fanaticism of the Mahometans, and are compelled to go barefoot in sign of their submission in nearly all the cities. Robbers plunder them almost with impunity, and murders of Jews are frequent. About a hundred enjoy protection from Christian powers, which was confirmed at the conference of Madrid in 1880, but is impatiently submitted to by the sultan.

Jews in the interior or beyond the boundary of Morocco live a nomad life like the Jewish tribes of Arabia, and conduct caravans across the desert as far as Timbuctoo. Mardochée, a member of the first Israelite family who settled in Timbuctoo, has described the Daggatoun (merchants), a tribe of Jews who have forgotten their religion, but cherish the tradition of their descent, and proclaim it by their fair complexions and the character of their features; they live in the Sahara in the midst of a Mussulman race, with whom they do not intermarry.

America.

There are several thousands of Jews in Brazil; a Dutch Jewish colony was founded at Savannas in Surinam, but has lost its distinctive character; a few Jews are scattered in Mexico and the South American ports.

In the United States Jews are numerous, and enjoy full equality of rights and great material prosperity. A Jewish colony was founded by Judge Mordecai Noah, sheriff of New York, in 1825, at Grand Island in the Niagara river, but did not long endure. The Jews of the United States organize themselves in great friendly societies. Of these there are four principal orders:—the B'nai Berith (Sons of the Covenant), which in 1878 had 22,814 members, had paid $1,000,000 in benefits, and retained $570,000 in hand; the Independent Order of Free Sons of Israel, with 8604 members; the Kesher shel Barzel (Iron Link), with 10,000 members and $112,000; the Improved Order Free Sons of Israel, with 2849 members. Jewish hospitals, orphan asylums, free schools, benevolent institutions, exist in very many cities. The union of American congregations comprises 118 congregations, and has for its objects (1) to promote religious instruction, and (2) to co-operate with similar associations throughout the world to relieve and elevate oppressed Jews. Many ways of interpreting Scripture prevail among the Jews in the United States.[1] Some keep Sabbath on Sunday, others pray in English without any use of Hebrew; there is much laxity in observance, but all sects agree in building magnificent synagogues. In 1878 there were in the United States 278 congregations with 12,546 members, owning in their corporate capacity real estate worth $4,778,700 and other property worth $1,860,030, sending 12,886 children to their schools, and forming a population of about 250,000.

Some further particulars may be given regarding the Jewish press. There are, according to Lippe, 86 Jewish periodicals, as follows;—18 in the Hebrew language, published at Vienna (2), Warsaw (2), Wilna, St. Petersburg, Königsberg (2), Lyck (2), Mainz, Jerusalem (3), and 4 in Galicia (at Brody, Kolomea, Tarnopol, and Lemberg); 14 in Jüdisch-Deutsch, published at Vienna (2), Bucharest (3), Mainz, New York, Pressburg, Chicago, Königsberg, Lemberg, Budapest (2); 22 in German, published at Würzburg, Breslau. Berlin (4), Frankfort-on-the-Main, Leipsic (3), Bromberg, Krotoschin, Mainz, Magdeburg, Lemberg, Budapest (2), Melnik (Bohemia), Bilni (Bohemia), Vienna, Cincinnati, and Milwaukee; 4 in French (reckoning the bulletin of the Alliance as one) at Paris (3), Avignon; 14 in English, at London (2), New York (4), Cincinnati (2), San Francisco (partly in German), Chicago, Philadelphia, Atlanta, St. Louis, and Melbourne; 3 in Italian, at Trieste, Casale Monferrato, and Corfu; 3 in Dutch, at Rotterdam (2), Amsterdam; 2 in Russian, both at St. Petersburg; 2 in Polish, at Warsaw and Tarnopol in Galicia; one in Hungarian, at Budapest; 6 in Spanish (5 of them in Hebrew characters), at Vienna (2), Constantinople (2), Salonica, and Smyrna. In addition to these, Lippe gives 8 annuals:—1 in Roumanian at Bucharest, 1 in French at Paris, 1 in Russian at St. Petersburg, 1 partly in German and partly in Hebrew at Bamberg, and 4 in German at Brody, Frankfort-on-the-Main, Halberstadt, and Prague. Two Jewish calendars appear annually in London.

From the numbers of the Jewish population which we have given it results that there are about 5,000,000 Jews in Europe. In Asia,200,000, in Africa 700,000, may be approximately correct totals, in America 300,000 in Australia 20.000. The total Jewish population of the world would thus be 6,200,000. It may be added that the vital statistics of the Jews differ a little from those of the nations with which they have been compared. The Jews have a somewhat greater average longevity, which is attributed to their abstinence, comparative freedom from phthisis, etc., and to their not often following employments which shorten life. Their dietary laws and ceremonial ablutions have an influence in preserving them from epidemics.

JEW'S HARP, or **JEW'S TRUMP** (Fr. *Trompe*) a small musical instrument, known for centuries all over Europe, and consisting of a metal frame with two branches, between which a slender tongue of steel, fastened at one end, and free at the other, is made to vibrate by twitching with the finger, while the frame is held between the teeth. The English name "Jew's trump," seems to be merely a corruption of the French words *jeu* and *trompe.* Prefixed to the Rev. Patrick Macdonald's *Collection of Highland Airs* (1781) is a dissertation by the Rev. Walter Young, in which he states that the natives of the island of St. Kilda,

---

[1] The leader of the most advanced school is Dr. Felix Adler, who, in his discourses, *Creed and Deed*, advocates the supersession of religion by ethical culture.

"being great lovers of dancing, have a number of reels, which are either sung, or played on the Jew's harp or trump, their only musical instrument" (p. 11). In the Himalaya journals one of the travellers mentions that he procured a Jew's harp from Tibet. At the commencement of the present century this instrument was improved, and several Jew's harps were combined, it being thus possible by using several instruments in different keys to obtain a complete scale. Eulenstein, a native of Würtemberg, made a sensation in London in 1827 by playing on no less than sixteen Jew's harps. No. 30 of the *Leipsic Musical Gazette* (1816) contains an account of the compound Jew's harp, with pieces of music suited for it.

JEYPORE, or JÁIPUR, a native state in Rájputána, under the political superintendence of the Rájputána agency and the Government of India, lies between 25° 41′ and 28° 27′ N. lat., and between 74° 55′ and 77° 15′ E. long. It is bounded on the N. by Bíkaner, Loháru Jhajjar, and Patiála; on the E. by Alwar, Bhartpur, and Karáuli; on the S. by Gwalior, Bundí, Tonk, and Udáipur; on the W. by Kishangarh, Jodhpur, and Bíkaner. Its area is 14,465 square miles. The country is tolerably level and open, although its surface is diversified by groups and ranges of hills and by isolated peaks. The centre of the state is an elevated triangular table-land from 1400 to 1600 feet above sea-level, whose eastern limit is formed by ranges running north and south. On the north and west it is bounded by a broken chain of hills, an offshoot from the Aravalli mountains, which forms the apex of the triangle. To the east, beyond the hills, the country becomes gradually more open as it spreads out towards the alluvial flats of the Jumna. On the northwest stretches the sandy and desert tract of Shaikhawati (or the country of the Shaikhawat clan). The general drainage of Jeypore from the central table-land is to the east and southeast, though a few streams follow the slope to the northwest. Those flowing south are the Banás and the Bangangá, the tributary of the Jumna, and their tributaries, the Aman-i-sháh, Bándi, Moril, Dúnd, and Khari. The Sabi and Káotli flow north. In the south of the state, water is everywhere found at a depth varying from a few feet to 30 or 40 feet; but in Shaikhawati water is always at a great depth, averaging from 80 to 100 feet. The soil is generally sandy. The hills are more or less covered with jungle trees, of no value except for fuel. The hill ranges are said to consist in the north chiefly of granite, and in the south and east of sandstones, mixed sometimes with white and black marble, and occasionally with mica. Copper ore and cobalt are found. Salt is largely manufactured and exported from the Sambhar Lake, the average yearly turn-out amounting to nearly 40,000 tons.

In Shaikhawati there is generally but one crop in the year, consisting chiefly of *bájra*, *mung*, and *moth*. In the north, besides these, a little wheat and barley are grown. Towards the south and east, as the soil becomes richer and firmer, *joár*, Indian corn, cotton, *tíl*, wheat, barley, gram, sugar-cane, opium, tobacco, *dál*, and linseed are extensively grown. Since 1868 the state has spent £5000 annually on irrigation.

In the absence of a census the population has been roughly estimated at about $1\frac{3}{4}$ millions for the whole territory, with the following proportions of the various classes:—Rájputs, $\frac{1}{8}$; Hindus, $\frac{5}{8}$; Mahometans, $\frac{3}{16}$; Jains, $\frac{1}{16}$. The most notable feature in the commerce of the state is the large banking and exchange business carried on at the capital and in the large towns. The chief manufactures are marble sculpture, enamel work done on gold, woollen cloths and fabrics. Education has made great progress in the state. Jeypore city is the site of a college, with a daily attendance (1876) of 800 students; also of a school for the sons of thakúrs and higher officials, and a Sanskrit college and industrial school. In the district there are 33 elementary schools, wholly supported by the state, and 379 indigenous schools, with an aggregate attendance of nearly 8000. The coins minted at Jeypore are distinguished from those of other independent states by the *jhar* or sprig on the reverse. The Rájputána State Railway on the metre gauge runs from Agra to Jeypore city, and thence to Ajmir and Nusseerábád. The military force of the state consists of 824 artillerymen, 4450 cavalry, and 15,858 infantry. The number of forts is 38, with an aggregate of 220 guns of all calibres. Some £700,000 from the revenues of the state are alienated in *jágírs* and religion grants, but the available receipts are about £475,000. The climate is dry and healthy. The average temperature, taken from a record of five years, is 81° Fahr. The average rainfall is $25\frac{1}{2}$ inches.

The mahárájá of Jeypore belongs to the Kachhwaha tribe of Rájputs, and claims descent from Ráma, king of Ajodhya in Oudh. Jeypore state was founded in 967 by Dhola Ráo, who, along with his Kachhwahs, is said to have absorbed or driven out the petty chiefs. On the irruption of the Mahometans, Jeypore state had very soon to succumb to them, and the Jeypore house furnished some of their most distinguished generals. Among them were Mán Sinh, who fought in Orissa and Assam, Jái Sinh, commonly known by his imperial title of Mírza Rájá, whose name appears in all the wars of Aurangzeb in the Deccan, and Jái Sinh II., the famous mathematician and astronomer, and the founder of Jeypore city. Towards the end of the 18th century the Játs of Bhartpur annexed a portion of the state. The chief of Alwar reduced the territory of Jeypore. By the end of the century the state was in great confusion, distracted by internal broils, and impoverished by the exactions of the Marhattás. The disputes between the chiefs of Jeypore and Jodhpur had brought both states to the verge of ruin, and Amír Khán, with the Pindhárís, was exhausting the country. By a treaty in 1818 the protection of the British was extended to Jeypore, and an annual tribute fixed. In 1835, on the accession of the mahárájá, then two years old, there was a serious disturbance in the city, after which the British Government took measures to insist upon order, and to reform administration as well as to support its effective action; and the state has become gradually well governed and prosperous. When the mutiny broke out in 1857, the mahárájá assisted the British in every way that lay in his power.

JEYPORE, or JÁIPUR, capital of the state of the same name, is situated in 26° 55′ N. lat. and 75° 52′ E. long., on the Rájputána State Railway and the Agra and Ajmere trunk road. It is the largest town and the chief commercial centre of Rájputána, and in many respects the finest of modern Hindu cities. The city, which takes its name (Jáinagar or Jáipur) from the famous Mahárájá Siwái Jái Sinh II., by whom it was founded in 1728, stands on a small plain surrounded on all sides except the south by rugged hills, the summits of which are at all important points crowned with forts. At the end of the ridge, overhanging the city on the north-west, is the chief defensive work, the *Nahargarh*, or "Tiger Fort," the rock face of which is so scarped as to be inaccessible on the south or city side. Jeypore is remarkable for the regularity and wideness of its streets, and the architectural beauty of the mosques, temples, and private residences which adorn them. From east to west the town is a little over 2 miles in length, with a breadth of about $1\frac{1}{4}$ miles. The main streets are paved, and the city is lighted by gas. The houses of the nobility and the citizens are in the suburbs, while the mahárájá's palace with its pleasure-grounds occupies the centre of the town. In Jeypore there are as many as seven banking firms, whose aggregate annual business amounts to about £2,500,000, and which possess a capital of upwards of £6,000,000 sterling. Besides these, there are several minor houses, whose collective business may be estimated at £500,000 a year. Exchange and banking form the greater portion of the business of the place. The city is well provided with hospitals, dispensaries, almshouses, and schools. One of the most interesting antiquities of the state is the Hindu observatory in the capital, erected by the founder of the city.[1] The population in 1870 was 137,847.

JEZREEL (יִזְרְעֶאל), the well-known capital of the

---

[1] On the summit of a range of hills, about a mile and a half east of Jeypore town, is a sacred shrine called the "Gulta," where there is a temple dedicated to "Surya," or the Sun-god. Below the platform a spring issues, which pours over the rock by a fall of 70 feet into the valley below. The water of this spring is considered peculiarly sacred by the Bráhmans.

Israelite monarchy under Ahab. Its site has never been lost, and the present village *Zer'în* retains the name radically unchanged. In Greek the name appears under the form 'Εσδραηλά (*Stradela* in the *Itiner. Hieros.*), and to the crusaders the place was known as Parvum Gerinum. The modern village stands at the north extremity of a long ledge terminating in steep cliffs forming part of the chain of Mount Gilboa, east of the plain of Esdraelon. The top of the swell is 500 feet above the broad northern valley; the knoll on which the stone village is built is bare and rocky; the buildings are apparently modern, but numerous ancient cisterns and scattered sarcophagi, lying on the hill side, mark the antiquity of the site. The view over the plains from Beisân on the east to Carmel on the west, and from the Samaritan hills on the south to the mountains of Galilee on the north, is fine and extensive. No vineyards now exist, but rock-cut wine presses occur east of the village, perhaps marking the site of Naboth's vineyard (1 Kings xxi. 1). The fountain mentioned in the Bible (1 Sam. xxix. 1) is very probably the fine spring 'Ain el Meiyiteh north of the village, a shallow pool of good water full of small fish, rising between black basalt boulders. A very large spring, 'Ain Jálúd or Jálút (Yákút, iii. 760), exists in the valley of Jezreel (Josh. xvii, 16) north of the hill. A second city called Jezreel existed in the tribe of Judah, somewhere near Hebron (Josh. xv. 56).

JHÁLÁWÁR, a state in Rájputána, under the political superintendence of the Rájputána agency and the Government of India, mainly consisting of two separate areas. The larger is bounded on the N. by the state of Kotah; on the E. by Sindhia's territory and a detached district of the Tonk state; on the S. by the petty state of Rájgarh, a detached district of the Dewas state, and the state of Jaora; and on the W. by detached tracts belonging to Sindhia and Holkar. This portion lies between 23° 48′ and 24° 48′ N. lat., and between 75° 55′ and 77° E. long. The lesser detached area is bounded on the N., E., and S. by the Gwalior state, and on the W. by Kotah, and lies between 25° 5′ and 25° 25′ N. lat., and 76° 55′ and 77° 25′ E. long, The main portion of Jháláwár is situated on a raised plateau. The northern, eastern, and part of the southern portions are very hilly, and intersected by numerous streams. The hills are for the most part covered with timber and grass, and frequently enclose lakes. The rest of this tract is a rich undulating plain, dotted with evergreen trees. The soil generally is very rich, consisting in great part of dark clayey mould, which produces valuable crops. Of the many streams running through the territory, the most important are—the Parwan, with its tributary the Newáj; the Káli Sind, with its tributary the Aú; and the Chhota Káli Sind. The population in 1875 was 226,000, of whom the majority were Hindus. The area of the whole state is 2500 square miles.

In Jháláwár all the ordinary Indian grains are cultivated, and in the southern districts opium is extensively grown. In the rest of the state wheat and opium are the chief crops, except in Sháhábád, where *bájra* is chiefly produced. Irrigation is principally carried on by means of wells. Near Jhalra Patan, the capital, there is a large artificial lake, from which water is drawn by a channel 2 miles long. In 1876, 507,418 acres, or barely two-fifths of the total area, were cultivated. The total revenue for 1876 was £174,719. The police number 100 horse and 2000 foot. Education is at present very backward in the state. In the districts the village priest teaches the young people. In the capital and cantonment there are schools in which Hindí, Urdu, and English are taught. The only metalled roads in the state are in the cantonment. All other roads are simply cart tracks, which in the rains are useless for wheel traffic. Opium is exported; the imports are English cloths and grain. The chief towns are Jhalra Patan and the chhaoni or cantonment, Sháhábád, and Kailwara. The climate resembles that of Central India, and is generally healthy. In the hot weather the thermometer ranges during the day from 85° to 88° Fahr. The temperature during the rains is cool and pleasant, and in the cold weather it is occasionally frosty.

The ruling family of Jháláwár belongs to the Jhálá clan of Rájputs, and their ancestors were petty chiefs of Halwad in the district of Jháláwár, in Káthiáwár. About 1709 one of the younger sons of the head of the clan left his country with his son to try his fortunes at Delhi. At Kotah he left his son Madhu Sinh, who soon got into great favor with the mahárájá, and got from him an important post. which became hereditary. On the deathbed of one of the Kotah rájás, the country was left to the charge of Zalím Sinh, a descendant of Madhu Sinh. From that time Zalím Sinh was the real ruler of Kotah. He brought it to a wonderful state of prosperity, and under his administration, which lasted over forty-five years, the Kotah territory was respected by all parties. In 1838 it was resolved, with the consent of the chief of Kotah, to dismember the state, and to create the new principality of Jháláwár as a separate provision for the descendants of Zalím Sinh. The districts then severed from Kotah were considered to represent one-third (£120,000) of the income of Kotah; by treaty they acknowledged the supremacy of the British, and agreed to pay an annual tribute of £8000. Madan Sinh received the title of mahárájá rána, and was placed on the same footing as the other chiefs in Rájputána. The present mahárájá rána of Jháláwár has a force of 20 field and 75 other guns, 150 artillerymen, 425 cavalry, and 4400 infantry.

JHANG, a British district in the lieutenant-governorship of the Punjab, India, between 30° 35′ and 32° 4′ N. lat., and between 71° 39′ and 73° 38′ E. long., with an area of 5712 square miles. It forms the northern district of the Múltán division, and is bounded on the N. by Sháhpur and Gujránwála, on the W. by Derá Ismáil Khán, and on the S.E. by Montgomery. It comprises an irregular triangle, artificially constituted for administrative purposes from portions of three separate tracts. Its eastern half embraces a large part of the high dorsal bridge in the Rechna Doáb; thence it stretches across the Chenab into the wedge of land between that stream and the Jhélum, whose waters unite a few miles below the town of Jhang; while westward again the boundary runs beyond the joint river, far into the heart of the Sind Ságar Doáb. The Ravi also bounds the district for a few miles along its southern edge. So artificial a tract can hardly be said to possess any common natural features of its own. Along the banks of the river strips of comparatively fertile lowland support a dense population,

At the census of 1868 the population was 348,027 (193,624 males and 154,403 females). The Mahometans numbered 270,819; Hindus, 57,297; Sikhs, 2994; and "others," 16,917. Only three towns contain a population exceeding 5000—Jhang, 9124; Maghiána, 10,525; and Chiniot, 11,477. The area under cultivation in 1873 amounted to 241,325 acres, out of an assessed total of 3,650,867 acres. No crops can anywhere be grown without irrigation. Wheat, barley, gram, *sarson, china, joár*, maize, and cotton form the staples of the district. Grain is imported. Country cloth is manufactured at Jhang and Maghiána, and bought up by the Powinda merchants of Afghanistán. Manufactures of gold and silver lace also exist. The principal road from Múltán to Wazírábád passes through the chief towns in the district. A bridge of boats is in course of construction (1875) across the united stream of the Jhelum and the Chenáb. Both rivers are navigable. The total revenue for 1873 was £49,302. The police force in 1872 numbered 503 men. In 1872 there were 32 Government and 123 native schools, with a joint roll of 3696 pupils. The district bears a good reputation for healthiness. Small-pox and fever form the most prevalent diseases. The average rainfall for the seven years ending 1872-73 was 10 inches. There are seven charitable dispensaries.

The district of Jhang possesses unusual historical interest from the presence within its borders of the ruins which crown the rocky eminence of Sánglawála Tiba. This site has been identified with the Sákala of the Bráhmans, the Ságal of Buddhism, and the Sangala of Alexander's historians. In modern times the history of Jhang centres in the famous family of Siáls, who exercised an extensive sway over a large tract between Sháhpur and Múltán, with little dependence on the imperial court at Delhi, until they finally fell before the all-absorbing power of Ranjít Sinh. The Siáls of Jhang are Mahometans of Rájput descent, whose ancestor, Rai Shankar of Dáranagar, emigrated early in the 13th century from the Gangetic Doáb to Jaunpur. In the beginning of the present century the mahárájá Ranjít Sinh invaded Jhang, and captured the Siál chieftain's territories. He recovered a small portion afterwards, which he was allowed to retain on payment of a yearly tribute. In 1847, after the establishment of the British agency at Lahore, the district came under the charge of the British Government: and in 1848 Ismáil Khán, the Siál leader, rendered important services against the rebel chiefs, for which he received a pension. During the mutiny of 1857 the Siál leader again proved his loyalty by serving in person on the British side. His pension was afterwards increased, and he obtained the title of Khán Bahádur, with a small *jágir* for life.

Jhang, a municipal town in the above district. The sister town of Maghiána, containing the civil station for the district, lies three miles south of Jhang, and has a population of 10,525 persons. They form together a single municipality, and may be regarded as practically one town, situated in 31° 16′ 16″ N. lat., and 72° 21′ 45″ E. long., about 3½ miles to the west of the present bed of the Chenab. Jhang itself lies on the lowland, a little apart from the regular lines of trade, and since the removal of the Government offices to Maghiána, has yielded its commerce and importance to its younger rival. Founded by Mal Khán, a Siál chieftain, in 1462, it long formed the capital of a native Mahometan state. The population of Jhang proper in 1868 was 9124, comprising 4568 Hindus, 4244 Mahometans, 129 Síkhs, 12 Christians, and 171 "others." Population of the united towns, 19,649.

JHÁNSI, a British district in the lieutenant-governorship of the North-Western Provinces, India, between 25° 3′ 45″ and 25° 48′ 45″ N. lat., and between 78° 21′ 15″ and 79° 27′ 30″ E. long. It forms the central district in the division[1] of the same name, and is bounded on the N. by the Gwalior and Samthar states, on the E. by the river Dhasán, on the S. by the district of Lálitpur and the Orchha state, and on the W. by the Datiyá, Gwalior, and Khaniya Dáná states. Jhánsi forms a portion of the hill country of Bundelkhand, sloping down from the outliers of the Vindhyán range on the south to the tributaries of the Jumna on the north. The extreme south is composed of parallel rows of long and narrow-ridged hills. Through the intervening valleys the rivers of the district flow down impetuously over ledges of granite or quartz. North of the hilly region, the rocky granite chains gradually lose themselves in clusters of smaller hills. The northern portion consists of the level plain of Bundelkhand, distinguished for its deep black soil, known as *már*, and admirably adapted for the cultivation of cotton. The district is intersected or bounded by three principal rivers—the Pahúj, Betwa, and Dhasán. There are many minor streams, most of which are feeders of the Dhasán. The district is much cut up, and portions of it are insulated by the surrounding native states.

The census of 1872, taken over an area of 1567 square miles, returned a population of 317,826, of whom (exclusive of non-Asiatics) 167,519 were males and 150,216 females. As regards religion, 305,151 were Hindus, while only 12,417 were Mahometans. Five towns have a population exceeding 5000:—Mhow, 15,065; Ránípur, 6326; Gúrsarái, 5897; Barwa Ságar, 5556; and Bhánder, 5141. Jhánsi, in the nature of its soil, the character of its people, the poor means of irrigation, and the want of good communication, is worse off than any other district in the North-Western Provinces, except Lálitpur. Out of a total area of 1,002,734 acres, only 428,348 acres were under cultivation. The principal crops are *joár*, *bájra*, cotton, *tili* or oilseed, *kodon* (a kind of pulse), wheat, gram, and barley. The most important product is the *al* dye, procured from the root of the *Morinda citrifolia*, which is only dug up every third year. The destructive *káns* grass has proved as great a pest here as elsewhere in Bundelkhand. Jhánsi is specially exposed to blights, droughts, floods, hailstorms, epidemics, and their natural consequence—famine. It is considered that famine may be feared on an average every five years. The district imports grain, and in return exports the *al* dye and cotton. The 110 schools in 1870 taught 2235 pupils at a cost of £1247. The climate is hot and very dry, but not unhealthy. The mean annual temperature for 1871 was 81°.7 Fahr. The average rainfall for the ten years ending 1870 was 31 inches. The population are habitually underfed, and consequently succumb readily to slight diseases.

Nothing is known with certainty as to the history of this district before the period of Chandel rule, about the 11th century of our era. To this epoch must be referred the artificial reservoirs and architectural remains of the hilly region. The Chandels were succeeded by their servants the Ḳhángars, who built the fort of Karár, lying just outside the British lines. About the 14th century the Bundelas poured down upon the plains, and gradually spread themselves over the whole region which now bears their name. The Mahometan *subahdárs* were constantly making irruptions into the Bundela country; and in 1732 Chhatarsál, the Bundela chieftain, called in the aid of the Marhattás. They came to his assistance with their accustomed promptitude, and were rewarded, on the rájá's death in 1734, by one-third of his dominions. Their general founded the city of Jhánsi, and peopled it with inhabitants from Orchha state. In 1806 the British protection was promised to the Marhattá viceroy, and in 1814 the peshwá ceded to the East India Company his rights over Bundelkhand. In 1853 Gangadhar Rão died childless, and his territories lapsed to the British. The Jhánsi state and the Jaláun and Chanderi districts were then formed into a superintendency. The widow of the late rájá considered herself aggrieved because she was not allowed to adopt an heir, and because the slaughter of cattle was permitted in the Jhánsi territory. Reports were spread which excited the religious prejudices of the Hindus. The events of 1857 accordingly found Jhánsi ripe for mutiny. In June a few men of the 12th native infantry seized the fort containing the treasure and magazine, and massacred the European officers of the garrison. Everywhere the usual anarchic quarrels rose among the rebels, and the country was plundered mercilessly. The rání put herself at the head of the rebels, and died bravely in battle. It was not till November, 1858, after a series of sharp contests with various guerilla leaders, that the work of reorganization was fairly set on foot. Since that time Jhánsi has remained a British district, and famines and floods alone have disturbed the prosperous course of civil administration.

Jhansi, a city and fort in Gwalior state, North-Western Provinces, India, in 25° 27′ 30″ N. lat. and 78° 37′ E. long. A stone fort crowns a neighboring rock, and commands the town, as well as the British outpost Jhánsi Naoábád, which adjoins the city. It lapsed to the British in 1853, and during the mutiny was the scene of insurrection and massacre. In 1861 the town, fort, and surrounding territory beyond the Pahúj were handed over to Gwalior state. The administrative headquarters of Jhánsi district is Jhánsi Naoábád, which had a population in 1872 of 536 persons. The estimated population of Jhánsi proper is 30,000.

JHELUM, or **Jhílam**, a district in the lieutenant-governorship of the Punjab, India, between 32° 26′ and 33° 15′ N. lat., and between 71° 51′ and 73° 50′ E. long., bounded on the N. by Ráwal Pindí district, E. by the Jhelum river, S. by Sháhpur district, and W. by Bannu district. It forms the southeastern portion of a rugged Himálayan spur, extending between the Indus and Jhelum to the borders of the Sind Ságar Doáb. Its scenery is very picturesque, although not of so wild a character as the mountain region of Ráwal Pindí to the north, and is lighted up in places by smiling patches of cultivated valley. The backbone of the district is formed by the Salt Range, a treble line of parallel hills running in three long forks from east to west throughout its whole breadth. The range rises in bold and striking precipices, broken by gorges, clothed with green brushwood and traversed by trickling streams, at first pure and fresh, but soon impregnated with the saline matter over which they pass. Between the line of hills lies a picturesque table-land, in which the beautiful little lake of Kallar Kahár nestles amongst the minor ridges. North of the Salt Range, the country extends upwards in an elevated plateau, diversified by countless ravines and fissures, until it loses itself in the tangled masses of the Ráwal Pindí mountains. In this rugged tract cultivation is rare and difficult, the soil being choked with saline matter. At the foot of the Salt Hills, however, lies a small strip of level soil, lying along the banks of the Jhelum, and thickly dotted with prosperous villages. The drainage of the district is determined by a low central watershed running north and south at right angles to the Salt Range. The waters of the western portion find their way into the Sohán, and finally into the Indus; those of the opposite slope collect themselves into small torrents, and empty themselves into the Jhelum.

---

[1] The division of Jhánsi is under a commissioner in the North-Western Provinces, and comprises the three districts of Jhánsi, Jaláun, and Lálitpur, which contain a large portion of the tract known as Bundelkhand. The area in 1872 was 5067 square miles, the population 934,943.

The census of 1868 returned the population of Jhelum district at 500,988, inhabiting 113,010 houses, and spread over an area of 3910 square miles. The Mahometans numbered 434,157; Hindus, 49,111; Síkhs, 13,865; and "others," 3855. Five towns contained in 1868 a population exceeding 5000:—Pind Dádan Khán, 15,740: Chakwál, 5767; Talágang, 5767; Lawa, 5256; and Jhelum, 5148. Of a total area of 2,502,290 acres, but 763,845 acres are under cultivation, and only 258,825 acres more are returned as capable of tillage. The staple crops are wheat and *bájra*. Trade is chiefly concentrated in the town of Pind Dádan Khán. The exports are salt, silk and cotton goods, brass and copper wares; the imports, English piece goods and metals, and woollen fabrics from Kashmír and from Central Asia *via* Pesháwar. Salt is procured in immense quantities from the central hills of the Salt Range; the net revenue from this source in 1871-72 amounted to £362,193. The total revenue in 1872–73, excluding salt, was £70,299, of which £59,766 was derived from the land tax. The police force consisted in 1873 of 527 men. For fiscal and administrative purposes the district is subdivided into 4 *tahsíls* and 10 *parganás*, containing 939 estates, and owned by 49,866 proprietors.

The history of the district dates back from the semi-mythical period of the *Mahábhárata*. Hindu tradition represents the Salt Range as the refuge of the five Pándava brethren during the period of their exile, and every salient point in its scenery is connected with some legend of the national heroes. Modern research has fixed the site of the conflict between Alexander and Porus as within Jhelum district, although the exact point at which the Macedonian king effected the passage of the Jhelum (or Hydaspes) is disputed. After this event, we have little information with regard to the condition of the district until the Mahometan conquest brought back literature and history to Upper India. The Janjúahs and Játs, who now hold the Salt Range and its northern plateau respectively, appear to have been the earliest inhabitants. The Ghakkars seem to represent an early wave of conquest from the east, and they still inhabit the whole eastern slope of the district; while the Awans, who now cluster in the western plain, are apparently later invaders from the opposite quarter. The Ghakkars were the dominant race at the period of the first Mahometan incursions, and long continued to retain their independence. During the flourishing period of the Mughal dynasty, the Ghakkar chieftains were among the most prosperous and loyal vassals of the house of Bábar; but after the collapse of the Delhi empire Jhelum fell, like its neighbors, under the sway of the Síkhs. In 1765 Gujar Sinh defeated the last independent Ghakkar prince, and reduced the wild mountaineers to subjection. His son succeeded to his dominions, until 1810, when he fell before the irresistible power of Ranjít Sinh. In 1849 the district passed, with the rest of the Síkh territories, into the hands of the British. Ranjít Sinh, however, had so thoroughly subjugated the wild mountain tribes that little difficulty was experienced in reducing it to working order, and the subsequent history of Jhelum has been purely fiscal and administrative.

JHELUM, the headquarters of the above district, situated on the north bank of the Jhelum river, in 32° 55′ 26″ N. lat. and 73° 46′ 36″ E. long. The town is quite of modern origin, and in 1868 contained a population of 5148, viz., Mahometans, 2831; Hindus, 1858; Síkhs, 442; Christians, 3; and "others," 14. The civil lines and cantonments for a regiment of native infantry lie about a mile north of the town, which is noted for boat building.

JHIND, or **JIND**, a native state in the Punjab, India, consisting of three or four isolated tracts to the east of the Sutlej. The area is 1236 square miles, and the estimated population 311,000. The principality was founded in 1763 by a Síkh of the Sidhu Ját tribe, and the chief was recognized as rájá by the Mughal emperor in 1768. The family have always been loyal supporters of the British Government. On the overthrow of the Marhattá power in northern India in 1804–5, the Jhind rájá was among the foremost to tender his allegiance to Lord Lake, who confirmed him in the possession of the estates he had held under the Mughal emperors and the Marhattás. After the Sutlej campaign a further grant of land was awarded the chief in recognition of his services. In 1857 Rájá Swarúp Sinh of Jhind was the first to march against the mutineers at Delhi. His troops acted as the vanguard of the army, and he himself remained in the British camp, until the reoccupation of the city, a portion of his soldiers aiding in the assault. For these services he received a grant of additional territory, yielding £11,681 per annum. The rájá enjoys an estimated revenue of between £60,000 and £70,000, and maintains a force of 10 guns, 79 artillerymen, 200 cavalry, and 1600 infantry. No tribute is paid by the state, but a contingent of twenty-five horsemen is furnished to the British Government.

JIDDAH, or **JUDDAH**,[1] also written Jeddah, Djiddah, or Djeddah, a town of Arabia, on the eastern coast of the Red Sea, in 21° 28′ N. lat. and 39° 17′ E. long., is of importance mainly as the principal landing-place of the pilgrims to Mecca. Its distance from that city is estimated at 44 or 46 miles. Built on a slight eminence, with a purple background of distant hills, Jiddah as seen from the sea presents an attractive aspect. The white tower-like houses, fancifully enriched with balconies, cornices, and lattices of rich-toned woodwork, shine out from an environment of grey sand and blue green sea with startling effect. The town extends along the beach for about a mile, and is surrounded by a high wall of modern date and in bad repair, with towers at intervals. At the northern end of the sea-face stand the prison and other public buildings, and at the southern end a small fort no longer available for the defence of the harbor. There are three landward gates, the Mecca gate to the east, through which all caravans pass, and where toll is levied on the transit of camels, the Medina gate to the north, and the Yemen gate to the south. In front of the Mecca gate is a rambling suburb, with shops, coffeehouses, and an open market-place. Before the Medina gate are the Turkish barracks, and beyond them the great holy place of Jiddah, the singular tomb of "our mother Eve," surrounded by the principal cemetery.

The tomb is a walled enclosure said to represent the dimensions of the body, about two hundred paces long and 15 feet broad. At the head is a small erection where gifts are deposited, and rather more than half-way down a whitewashed dome encloses a small dark chapel within which is the black stone known as *El-surrah*, the navel. The grave of Eve is mentioned by Edrisi, but except the black stone nothing bears any aspect of antiquity. Further details in Burton's *Pilgrimage*, vol. ii. p. 298, and a view in Mrs. Burton's *A. E. I.*

Beyond the immediate suburbs the country as far as the foot of the hill is desert, with scanty pasturage and a few villages of Arab huts. The inhabitants (Harb, Huteym, Zobeid) are engaged in camel transport, slave running, and mother of pearl fishery.

The town itself, which consists of four quarters, is well built, with a good bazaar and many lofty and spacious houses, built of the madrepore rock of the district. The best dwellings are near the Medina gate; the mosques are not remarkable, and the streets are narrow and in part very filthy. The wretched huts which formerly occupied part of the enceinte have been almost entirely removed since the frightful outbreak of cholera among the pilgrims in 1864–65, and the lowest strata of the population now occupy a village without the walls. The sanitary condition of Jiddah still, however, leaves much to be desired, especially in the pilgrim season. The chief defect is the scanty water supply derived from cisterns and wells outside the town. A conduit from the hills has been projected, and would yield a copious stream of excellent water, but the scheme is opposed by the owners of the cisterns, who drive a lucrative trade, a camel-load of water (16 skins of about 7 pints each) costing as much as sixteenpence, or after protracted drought much more. The permanent population of Jiddah is very variously estimated. Mr. Beyts (*Consular Reports*, 1875) places it at 30,000, including 2000 Indian settlers, 100 Greeks, Syrians, and Maltese, and 25 Franks; but the Dutch consul in 1879 allows a total of 15,000 only. The native population is of very mixed blood.

---

[1] The form Juddah has the authority of Yákút, but is not now used.

Jiddah is said to have been founded by Persian merchants in the caliphate of Othman, but its great commercial prosperity dates from the beginning of the 15th century, when it became the centre of trade between Egypt and India. Down to the time of Burckhardt the Suez ships went no farther than Jiddah, where they were met by Indian vessels. The introduction of steamers in the Red Sea has deprived Jiddah of its place as an emporium not only for Indian goods but for the products of the Red Sea, which formerly were collected here, but are now largely exported direct by steamer from Hodeida, Suákin, and other ports, though coffee from Yemen and gums from the African coast still pass in considerable quantities through the hands of the Jiddah merchants. The chief exports, apart from these, are mother-of-pearl (fished by slave divers) and hides. The chief local manufactures are a coarse cotton fabric, embroideries in gold and silver, lacquer work, beads in black coral, and the like. Boat-building is carried on with great skill. The baggalas of from 50 to 60 tons are built of East Indian wood, and are excellent sailers. The imports of Jiddah are considerable, as the town supplies the interior not only with manufactured goods, but with grain and other provisions. See full details of the trade in a valuable paper by the Dutch consul, Mr. Kruyt, in *Tijdsch v. h. Aardr. Genootschap* (Amsterdam, 1880, No. 5). The total exports and imports for 1879 are valued at £2,204,030. In the same year the port was visited by 241 steamships (213,295 tons) and 1156 sailing vessels (55,932 tons). The harbor is not convenient of access, but the roadstead when entered is well protected by coral reefs.

The introduction of steam traffic, while fatal to other local interests, has given a great impulse to the pilgrim trade, which is now regarded as the annual harvest of Jiddah. The pilgrim steamers are usually chartered by European merchants in conjunction with native capitalists and persons of religious influence. The average number of pilgrims annually landed at the port is not much short of 40,000. For 1879 Mr. Kruyt enumerates 7995 Turks, 2286 from the Barbary states, 3459 Egyptians, 8787 Malayans and Javanese, 10,894 Indians, 3506 Persians, 3300 Arabs from Yemen, the Súdán, and other places.

In the early years of the present century Jiddah resisted with success repeated attacks of the Wahhábites, and remained in the hands of the grand sheríf when he had lost the rest of the Hijáz. It was governed by Egypt during the Arabian wars of Mehemet Ali, but since 1840 has been again occupied by the Turks. There is a Turkish caim-macam under the wály of the Hijáz and a Turkish cadi, but the sheríf through his resident agent exercises an authority practically superior to that of these officials. In 1858 the attempts of England to suppress the slave-trade and a supposed insult to the Ottoman flag led to a plot to murder all the Christians in town, which was executed with fatal success (15th June), the English consul, Page, and the French consul, Éveillard, being among the victims. This outrage was followed by the bombardment of the town by the English man-of-war "Cyclops," and the authorities were compelled publicly to execute the Turkish governor and two leading citizens involved in the plot.

For further details see, in addition to the works already cited, Niebuhr's *Voyage;* Burckhardt's *Travels in Arabia*, vol. i., London, 1829; Von Maltzan's *Reise nach Südarabien*, Brunswick, 1873. See also Ritter *Erdkunde von Arabien*, 1847; Zehme, *Arabien und die Araber*, Halle, 1875.

JILOLO, GILOLO, or DJILOLO (properly Jailolo or Djailolo, and in the native tongue *Halmahera* or *Halemahera*, *i.e.*, the mother or great land), is one of the larger islands of the East Indian archipelago, forming part administratively of the Dutch residency of Ternate. The equator cuts across the southern peninsula, the most northerly point of the island lying in 2° 13′ N. lat. and the southern extremity in 0° 52′ S. A large proportion of Jilolo is practically *terra incognita*, though information has somewhat accumulated since Wallace complained, in 1856, of the smallness of our knowledge in regard to it. The area is stated at 6410 square miles; the extreme irregularity of the outline, however, renders the estimate a peculiarly precarious one. Jilolo may be said to consist of four peninsulas so arranged as to enclose three great bays (Kaou, Bitjoli, Weda), all opening towards the east,—the northern peninsula being connected with the others by an isthmus only 5 miles wide. On the western side of the isthmus lies another bay, that of Dodinga, in the mouth of which are situated the two islands, Ternate and Tidore, whose political celebrity so far exceeds that of their larger neighbor Jilolo. To the northeast of the northern peninsula we have the considerable island of Morotai, and to the west of the southern peninsula the far more important island of Batchian. The northern peninsula is full of mountain chains, which give clear evidence of former volcanic activity; and at least one of the summits, Tolo or Gunong Api (3000 feet), was not quite extinct in the 16th century, according to Valentijn's report. At present the crater, as described by Bernstein, is 200 feet deep, and contains a small lake. Gunong Tabello is higher than Tolo, and Gunong Mamuya has a similar altitude. In the south of the peninsula lies a lake, Talaga Lamo (the Telagalina of Bernstein's account), about 4 or 5 miles long. The principal village is Galela, situated on a bay of the same name, on the east coast, in a well cultivated plain which extends southward and inland. The three remaining peninsulas, which have been less explored, seem to be hardly so mountainous. The whole island is clothed with a prolific vegetation, some of the more important features of which will be found described in Teysmann's paper in the Report of the Botanic Garden at Buitenzorg. Rice is grown by the natives, but the sago tree is of far greater importance to them.

The people of Jilolo are for the most part pagans, living in a very backward state of civilization. Attempts to Christianize them have been made with but small success by the missionaries of the Utrecht Society, who have their chief stations at Swakenora and Dokolamo, near Lake Talaga Lamo (see *Berigten der Utrechtsche Zendingsvereeniging*, 1869). M. Achille Raffray gives the following description of the Halmaherians in *Tour du Monde*, 1879, where photographs of a number of the natives will be found. "They are as unlike the Malays as we are, excelling them in tallness of stature and elegance of shape, and being perfectly distinguished by their oval face, with a fairly high and open brow, their aquiline nose, and their horizontally placed eyes. Their beards are sometimes thick; their limbs are muscular; the color of their skins is cinnamon brown. Spears of iron-wood, abundantly barbed, and small bows and bamboo arrows, free from poison, are their principal weapons." According to Teysmann they have temples (*sabuas*) in which they suspend images of serpents and other monsters, as well as the trophies procured by war. They believe in a better life hereafter, but have no idea of a hell or a devil, their evil spirits only tormenting them in the present state.

The Portuguese and Spaniards were better acquainted with Jilolo than with many other parts of the archipelago; they called it sometimes Batu China and sometimes Moro. It was circumnavigated by one of their vessels in 1525, and the general outline of the coasts is correctly given in their maps at a time when separate portions of Celebes, such as Macassar and Menado, are represented as distinct islands. The current name of the island (Jilolo) was really that of a native state, the sultan of which had the chief rank among the princes of the Moluccas before he was supplanted by the sultan of Ternate about 1380. His capital, Jilolo, lay on the west coast on the first bay to the north of that of Dodinga. In 1876 Danu Hassan, a descendant of the sultans of Jilolo, raised an insurrection in the island for the purpose of throwing off the authority of the sultans of Tidore and Ternate; and his efforts would probably have been successful but for the intervention of the Dutch.

See J. P. C. Cambier, "Rapport over Tidoreesch-Halmahera (1825);" "Beknopte Woordenlijst van Talen op Tidoreesch-Halmahera"; and Robidé van der Aa, "Vluchtige Opmerkingen over de Talen der Halmahera groep"—all three in *Bijdr. tot de T. L. en V. Kunde van N. Ind.*, 1873; Meinicke, "Dr. Bernstein's Reise in den Nördl. Molukken," in Petermann's *Mittheilungen*, 1873; Dr. Hamy, "Les Alfourous de Gilolo" in *Bull. de la Soc. de Géogr.* 1877 (based on information from Raffray); Teysmann in *Bijdr. tot de T. L. en V. Kunde*, 1878, translated in *Annales de l'Extrême Orient*, 1879.

JIMENES, or Ximenes, de Cisneros, Francisco (1436–1517), cardinal and statesman, was born in 1436 at Torrelaguna, in Castile, of good but poor family. He studied at Alcala de Henares and afterwards at Salamanca; and in 1459, having entered holy orders, he went to Rome. Returning to Spain in 1465, he brought with him an "expective" letter from the pope, in virtue of which he took possession of the archpriestship of Uzeda in the diocese of Toledo in 1473. Carillo, archbishop of Toledo, opposed him and on his obstinate refusal to give way threw him into prison. For six years Jimenes held out and at length in 1480 Carillo restored him to his benefice. This Jimenes exchanged almost at once for a chaplaincy at Siguenza, under Cardinal Mendoza, bishop of Siguenza, who shortly appointed him vicar-general of the diocese. In that position Jimenes won golden opinions from ecclesiastic and layman; and he seemed to be on the sure road to distinction among the secular clergy, when he abruptly resolved to become a monk. Throwing up all his benefices, and changing his baptismal name Gonzales for that of Francisco, he entered the Franciscan monastery of San Juan de los Reyes, recently founded by Ferdinand and Isabella at Toledo. Not content with the ordinary severities of the noviciate, he added voluntary austerities. He slept on the bare ground, wore a hair shirt, doubled his fasts, and scourged himself with much fervor; indeed throughout his whole life, even when at the acme of his greatness, his private life was most rigorously ascetic. The report of his sanctity brought crowds to confess to him; but from them he retired to the lonely monastery of Our Lady of Castañar; and he even built with his own hands a rude hut in the neighboring woods, in which he lived at times as an anchorite. He was afterwards guardian of a monastery at Salzeda. Meanwhile Mendoza (now archbishop of Toledo) had not forgotten him; and in 1492 he recommended him to Isabella as her confessor. The queen sent for Jimenes, was pleased with him, and to his great reluctance forced the office upon him. The post was politically important, for Isabella submitted to the judgment of her father-confessor not only her private affairs but also matters of state. Jimenes's severe sanctity soon won him considerable influence over Isabella; and thus it was that he first emerged into political life. In 1494 the queen's confessor was appointed provincial of the order of St. Francis, and at once set about reducing the laxity of the *Conventual* to the strictness of the *Observantine* Franciscans. As was to be expected, intense opposition was offered, and continued even after Jimenes became archbishop of Toledo. The general of the order himself came from Rome to interfere with the archbishop's measures of reform, but the stern inflexibility of Jimenes, backed by the influence of the queen, met and subdued every obstacle. Cardinal Mendoza had died in 1495, and Isabella had secretly procured a papal bull nominating her confessor to his diocese of Toledo, the richest and most powerful in Spain, second perhaps to no other dignity of the Roman church save the papacy. Long and sincerely Jimenes strove to evade the honor; but his *nolo episcopari* was after six months overcome by a second bull ordering him to accept consecration. With the primacy of Spain was associated the lofty dignity of high chancellor of Castile; but Jimenes still maintained his lowly life; and, although a message from Rome required him to live in a style befitting his rank, the outward pomp only concealed his private asceticism, just as his splendid robes covered his monk's frock. In 1499 Jimenes accompanied the court to Granada, and there eagerly joined the mild and pious Archbishop Talavera in his efforts to convert the Moors. Talavera had begun with gentle measures, but Jimenes preferred to proceed by haranguing the *fakihs*, or doctors of religion, and loading them with gifts. Outwardly the latter method was successful; in two months the converts were so numerous that they had to be baptized by aspersion. The indignation of the unconverted Moors swelled into open revolt. Jimenes was besieged in his house, and the utmost difficulty was found in quieting the city. Baptism or exile was offered to the Moors as a punishment for rebellion. The majority accepted baptism; and Isabella, who had been momentarily annoyed at her archbishop's imprudence, was satisfied that he had done good service to Christianity.

On November 26, 1504, Isabella died. Ferdinand at once resigned the title of king of Castile in favor of his daughter Joan and her husband the archduke Philip, assuming instead that of regent. Philip was keenly jealous of Ferdinand's pretensions to the regency; and it required all the tact of Jimenes to bring about a friendly interview between the princes. Ferdinand finally retired from Castile; and though Jimenes remained, his political weight was less than before. The sudden death of Philip in September, 1506, quite overset the already tottering intellect of his wife; his son and heir Charles was still a child; and Ferdinand was at Naples. The nobles of Castile, mutually jealous, agreed to entrust affairs to the archbishop of Toledo, who, moved more by patriotic regard for his country's welfare than by special friendship for Ferdinand, strove to establish the final influence of that king in Castile. Ferdinand did not return till August, 1507, and with him he brought a cardinal's hat for Jimenes. Shortly afterwards the new cardinal of Spain was appointed grand inquisitor-general for Castile and Leon. See Inquisition.

The next great event in the cardinal's life was the expedition against the Moorish city of Oran in the north of Africa, in which his religious zeal was supported by the prospect of the political and material gain that would accrue to Spain from the possession of such a station. A preliminary expedition, equipped, like the following, at the expense of Jimenes, captured the port of Mers-el-Kebir in 1506; and in 1509 a strong force, accompanied by the cardinal in person (now in his seventy-second year), set sail for Africa, and in one day the wealthy city was taken by storm. Though the army remained to make fresh conquests, Jimenes returned to Spain, and occupied himself with the administration of his diocese, and in endeavoring to recover from the regent the expenses of his Oran expedition. On January 23, 1516, Ferdinand died, leaving Jimenes as regent of Castile for Charles (afterwards Charles V.), then a youth of sixteen in the Netherlands. Though Jimenes at once took firm hold of the reins of government, and ruled in a determined and even autocratic manner, the haughty and turbulent Castilian nobility and the jealous intriguing Flemish councillors of Charles combined to render his position peculiarly difficult; while the evils consequent upon the unlimited demands of Charles for money threw much undeserved odium upon the regent. In violation of the laws, Jimenes acceded to Charles's desire to be proclaimed king; he secured the person of Charles's younger brother Ferdinand; he fixed the seat of the cortes at Madrid; and he established a standing army by drilling the citizens of the great towns. Immediately on Ferdinand's death, Adrian, dean of Louvain, afterwards pope, produced a commission from Charles appointing him regent. Jimenes admitted him to a nominal equality, but took care that neither he nor the subsequent commissioners of Charles ever had any real share of the power. In September, 1517, Charles landed in the province of Asturias, and Jimenes hastened to meet him. On the way, however, he fell ill, not without a suspicion of poison. While thus feeble, he received a letter from Charles coldly thanking him for his services, and giving him leave to retire to his diocese. A few hours after this virtual dismissal, which some, however, say the cardinal never saw, Francisco Jimenes died at Roa, November 8, 1517.

Jimenes was a bold and determined statesman. Sternly and inflexibly, with a confidence that became at times overbearing, he carried through what he had decided to be right, with as little regard for the convenience of others as for his own. In the midst of a corrupt clergy his morals were irreproachable. He was liberal to all, and founded and maintained very many benevolent institutions in his diocese. His whole time was devoted either to the state or to religon; his only recreation was in theological or scholastic discussion. Perhaps one of the most noteworthy points about the cardinal is the advanced period of life at which he entered upon the stage where he was to play such leading parts. Whether his abrupt change from the secular to the regular clergy was the fervid outcome of religious enthusiasm or the far-seeing move of a wily schemer has been disputed; but the constant austerity of his life, his unvarying superiority to small personal aims, are arguments for the former alternative that are not to be met by merely pointing to the actual honors and power he at last attained.

His services to learning and literature have yet to be noted. In 1500 was founded, and in 1508 was opened the university of Alcala de Henares, which fostered by Cardinal Jimenes, at whose sole expense it was raised, attained a great pitch of outward magnificence and internal worth. At one time 7000 students met within its walls. In 1836 the university was removed to Madrid, and the costly buildings were left vacant. In the hopes of supplanting the romances generally found in the hands of the young, Jimenes caused to be published religious treatises by himself and others. He revived also the Mozarabic liturgy, and endowed a chapel at Toledo, in which it was to be used. But his most famous literary service was the printing at Alcala (in Latin *Complutum*) of the Complutensian Polyglott, the first edition of the Christian Scriptures in the original text.[1]

The work by Alvaro Gomez de Castro, *De Rebus Gestis Francisci Ximenii* (folio, 1659, Alcala), is the quarry whence have come the materials for biographies of Jimenes—in Spanish by Robles (1604) and Quintanilla (1633); in French by Baudier (1635), Marsollier, (1684), Flèchier (1694), and Richard (1704); in German by Hefele (1844), translated into English by Canon Dalton, 1860) and Havemann (1848): and in English by Barrett (1813). See also Prescott's *Ferdinand and Isabella; Revue des Deux Mondes*, May, 1841; and *Mém de l'Acad. d'hist. de Madrid*, vol. iv.

JITOMIR. See ZHITOMIR.

JOACHIM (*c*, 1145–1202), abbot of Floris, has a place of considerable prominence in the category of those mystics who, like St. Hildegard or the abbess Elizabeth, on behalf of a sounder morality protested in prophetic denunciation against the many and gross abuses connected with the ecclesiasticism which prevailed in Europe towards the close of the 12th century. The few details of his life that can be given are neither very precise nor quite trustworthy; but it appears that he was born about 1145 at a village in the neighborhood of Cosenza, and that when a youth he had attended the Sicilian court; afterwards he made a pilgrimage to Palestine, and, having (whether previously or subsequently to his return is not stated) become a monk, he ultimately attained to the dignity of abbot of the monastery of Corace in Calabria (onwards from 1178). Here his studies in prophecy and apocalyptic brought him into great repute, and successive popes—Lucius III., Urban III., and Clement III.—manifested an interest in them. The last-named especially, in the first year of his pontificate (1188) urged Joachim to the completion of his commentary on the Apocalypse and also of his *Concordia utriusque Testamenti.* Soon afterwards the abbot, accompanied by a friend named Rainerius, leaving Corace in search of a more solitary life, set up among the lonely hills of Sylæ near Cosenza a new establishment, named "Sancti Joannis in Flori," for which he drew up a new and stringent rule, afterwards sanctioned (in 1196) by Celestine III. From this cloister ultimately sprang a whole congregation,—the so-called "Ordo Florensis." The only work published during his lifetime was the *Concordia*, which had been duly submitted to the judgment of the Holy See, and before his death (which occurred between September, 1201, and June, 1202), he left in writing a memorandum with reference to his other compositions,—the *Expositio in Apocalypsin*, the *Psalterium decem chordarum*, *Contra Judœos*, and *Contra cathol. fidei adversarios*,—intimating his desire and intention that these should also be subject to the same censorship.

His study of apocalyptic prophecy had resulted in the construction of an elaborate scheme of the past and future course of the divine kingdom which is as interesting as it is curious. He distinguished three stages or ages of the world corresponding to the three persons of the Trinity, the three conditions of married persons, clergy, and monks, the three periods of the Old Testament, the New Testament, and the final dispensation. The advent of the last of these periods, that of the Holy Spirit, the "spiritualis intelligentia," proceeding from the old and New Testaments, he regarded as imminent. It was to be the period of perfect freedom from the letter, of monastic contemplation, adoration, and jubilation, and of the widest possible diffusion of the gospel (even to the Jews); but it was to be preceded by fearful judgments, in which Antichrist should become manifest. He regarded the Church of Rome as having been typified by the kingdom of Judah, while the Eastern Church corresponded to that of Israel. The way in which he worked out this analogy gave him scope for pointing out the manifold errors and corruptions into which he believed the Church of the West to have fallen, yet in no spirit of hostility to that organization as such. His eschatology found great currency and much acceptance amongst the stricken members of the Franciscan order,—the "Zelatores" as they were called,—and gradually gave rise to a cognate literature more manifestly opposed to Rome and even to ecclesiasticism of any kind. Among this class of compositions the greatest historical importance belongs to the *Liber introductorius in Evangelium œternum*, now no longer extant except in some excerpts. The work was censured as heretical by the university of Paris, and the order for its destruction was obtained from Alexander IV. in 1255; this, however, only stimulated the public interest in the books of Joachim himself, which now began to be circulated and read more widely than ever. That interest died a natural death, however, when the year 1260. which Joachim had fixed as the time of the end, had come and gone, leaving the old and evil world practically unchanged.

See Engelhardt *Kirchengeschichtliche Abhandlungen*, 1832; Neander, *Gesh. d. christl. Religion u. Kirche* (English translation, vol. vii., 1852); Renan, "Joachim de Flore et l'Évangile éternel," in the *Revue des Deux Mondes* for 1866; Preger,

---

[1] In this work, on which he is said to have expended half a million of ducats, the cardinal was aided by the celebrated Stunica (D. Lopez de Zuñiga), the Greek scholar Nuñez de Guzman (Pincianus), the Hebraist Vergara, and the humanist Nebrija, by a Cretan Greek Demetrius Ducas, and by three Jewish converts, of whom Zamora edited the Targum to the Pentateuch. The other Targums are not included. In the Old Testament Jerome's version stands between the Greek and Hebrew. The synagogue and the Eastern Church, as the preface expresses it, are set like the thieves on this side and on that, with Jesus (that is, the Roman Church) in the midst. The text occupies five volumes, and a sixth contains a Hebrew lexicon, etc. The work commenced in 1502. The New Testament was finished in January, 1514, and the whole in April, 1517. It was dedicated to Leo X., whose permission to publish was so tardy that the book did not come before the public till 1522. The MSS. on which the Hebrew text was based are still at Madrid; the history of those used for the New Testament has long been a problem, but the story that they were sold to a fireworks maker appears to be a fable. See Delitzsch's unfinished studies on the subject (London, 1872, and Leipsic, 1878,.

Gesch d. deutschen Mystik, vol. i., 1875; and Möller's art, "Joachim von Floris," in Herzog-Plitt's *Real-Encyk*, vol. vi.

JOACHIMSTHAL (Boh., *Jáchimov*), a mining town of Bohemia, in the circle of Eger, is favorably situated in a valley on the southern slopes of the Erzgebirge, about 10 miles north of Carlsbad, and 3 miles from the Saxon frontier, at an elevation of 2000 feet above the level of the sea, 50° 23′ N. lat., 12° 54′ E. long. It is the seat of a circuit court and board of mines, and has two commercial schools and establishments for teaching lace-making, and straw plaiting. The inhabitants are chiefly employed in mining, and in the manufacture of white and red lead, vermilion, cobalt, smalt, uranium, yellow bismuth, and nickel; also of thread, lace, basket-work, cutlery, paper, and cigars. The town owes its celebrity to the silver, lead, tin, and iron mines in its vicinity. During the 16th century the silver mines reached a very high point of productiveness, but since that period the yield has considerably declined. Population in 1870, 6586.

In place of the present town of Joachimsthal, which dates from the year 1516, there stood formerly the village of Conradsgrün. This was ceded by the kings of Bohemia to the counts of Schlick, from whom it passed by feudal tenure to the knights of Haslava. It is from the silver guldengroschen, first coined in 1518 by order of Count Schlick, and afterwards known as Joachimsthaler, that the German term *thaler* is derived. In 1547, during the Smalkald war, the town was besieged by William Thumshirn, general of John Frederick, elector of Saxony, but the siege was soon raised. In 1579 certain special privileges and additional lands were granted to Joachimsthal by the emperor Rudolph II. The last emigration of Protestants from the neighborhood to Saxony took place in 1663. Three-fourths of the town was destroyed by fire on the 31st March, 1873. The large church of St. Joachim, which was also burned, was rebuilt and restored in 1876. In the neighborhood are the ruins of the castle of Freudenstein.

JOAN, the name given to a female pope, now regarded as a fictitious personage, who under the title of John VII. or VIII. was said, according to the most general accounts, to have occupied the papal chair between the pontificate of Leo IV. and Benedict III., although various other dates are given. Tradition represents her as of English descent, but born in Ingelheim or Mainz. By some her original name is given as Gilberta, by others as Agnes. She was credited with having fallen in love with a young Benedictine monk, and with having on that account assumed the male monastic habit and lived for some time in the monastery of Fulda. Her lover, it is affirmed, died while they were pursuing their studies together at Athens, and after his death she went to Rome, where, according to the most approved version of the story, she became a very successful professor. So high indeed became her reputation for piety and learning that the cardinals with one consent elected the supposed young monk the successor of Pope Leo IV. In this position she comported herself so as entirely to justify their choice until the catastrophe of giving birth to a male child during a procession to the Lateran palace suddenly and irrevocably blasted her reputation. She is said either to have died in childbirth or to have been stoned to death.

The story of the pontificate of Joan was received as fact from the 13th to the 15th century, but it has been discredited by later researches. The circumstantial evidence around which it clung, and which may have aided in suggesting it, was the observance of a circuit by the papal processions so as to avoid passing through a certain street (a statue at one time standing in that street, said to represent a woman and child, with a monumental stone near it having a peculiar inscription), and the use of a pierced seat at the enthronement of the popes. Of these facts other and more credible explanations have, however, been given, although there is no sufficient evidence to demonstrate beyond dispute the manner in which the story originated. According to Dr. Döllinger, who gives an elaborate analysis of the story in *Die Papst-Fabeln des Mittelalters*, Munich, 1863, the tradition finds no support in the original text either of Marianus Scotus, Sigebert of Gemblours, or Otto of Freysingen. She is first mentioned by Stephen de Bourbon, who died in 1261, and who took his information probably from the chronicle of the Dominican Jean de Mailly, no copy of which is now known to be in existence. The story is not found in any of the original manuscripts of Martinus Polus, and according to Döllinger was interpolated in that chronicle some time between 1278 and 1312. He attributes the propagation of the myth chiefly to its insertion in Martinus Polus, from which it was copied into the *Flores Temporum*, a chronicle founded on Martinus, and its real originators he supposes to have been the Dominicans and Minorites, who had a grudge against the papacy on account of the persecutions they were experiencing at the hands of Benedict VIII. So rapidly did the tradition spread that in 1400 a bust of the papess was placed in the cathedral of Siena along with the other popes, having the inscription "John VIII., a woman from England." The statue occupied this position till the beginning of the 17th century.

See the work of Döllinger above mentioned, which has been translated into English both in England and in America, and the authorities therein referred to.

JOAN OF ARC, or more properly Joanneta Darc, afterwards known in France as Jeanne d'Arc,[1] the Maid of Orleans, was born about 1411, the daughter of Jacques Darc, peasant proprietor of Domremy, a small village partly in Champagne and partly in Lorraine, and of his wife Isabeau de Vouthon, who from having made a pilgrimage to Rome had received the usual surname of Romée. Joan never learned to read or write, and received her sole religious instruction from her mother, who taught her to recite the Pater Noster, Ave Maria, and Credo. In her childhood she was noted for her abounding physical energy; but her vivacity, so far from being tainted by any coarse or unfeminine trait, was the direct outcome of intense mental activity and an abnormally sensitive nervous temperament. Towards her parents her conduct was uniformly exemplary, and the charm of her unselfish kindness made her the special favorite of many in the village. In all household work she was specially proficient, her skill in the use of the needle not being excelled by that of any matron even of Rouen. As she grew to womanhood she became inclined to silence, and spent much of her time in solitude and prayer. All advances made by the young men of her acquaintance with the view of winning her attention or favor she decisively repelled; and, while active in the performance of her usual round of duties, and apparently finding her mode of life quite pleasant and congenial, inwardly she was engrossed with thoughts reaching far beyond the circle of her daily concerns.

At this time, through the alliance and support of Philip of Burgundy, the English had extended their conquest over the whole of France north of the Loire as well as Guienne; and, while the infant Henry VI. of England had in 1422 been proclaimed king of France at his father's grave at St. Denis, Charles the dauphin, devoted only to present ease and pleasure, was almost passively contemplating the slow dismemberment of his kingdom by internal confusion and misery, and by the progressive encroachments of the English rule. The fact that the hard straits to which the kingdom was reduced were greatly owing to the conduct of Isabella, the dauphin's mother, who disinherited her son in favor of Henry V. of England, the husband of her daughter Catherine, supplied an opportunity for the fulfilment of the ancient prophecy of the enchanter Merlin, that the calamities which should fall upon France through the depravity of a woman would be removed by the instrumentality of a chaste virgin. To the imagination of the time there was, moreover, nothing strange in such a mode of deliverance, for it was no uncommon occurrence for damsels to accompany their lovers to the wars, and, disguised as pages, to share to some extent in their dangers and adventures. In the country of Joan the tradition was current that this virgin should come out of the forest of Domremy, where Joan was accustomed in her childhood to attend her father's sheep. How it therefore became fixed in her mind that she was the destined deliverer of her country there is little difficulty in understanding. She possessed a nature strongly sympathetic, and it was kindled to ardent patriotism by the sad condition of her country; her imagination was so overpoweringly vivid that it frequently deceived her reason; and her consciousness of endowments which could find no proper scope for their activity within her narrow sphere must have confirmed if they did not originate her prognostications that she was appointed to some high destiny. Gradually her whole attention became so engrossed with her country's wrongs that all her waking hours were one continued and prolonged prayer for its deliverance. The result was that, owing to a peculiarity in her nervous constitution, her own thoughts and hopes seemed to take audible voice, and returned to her as assurances and commands spoken to her by the saints. At last, when in 1428 Orleans, the key to the south of France, was invested by the English under the earl of Salisbury, the voices became so peremptory and urgent as to overcome all pretexts for delay on account of previous discouragements and rebuffs. Notwithstanding the strong remonstrances of her parents, who viewed her resolve with poignant grief and dismay, she now renewed with increased determination her efforts to win from Robert de Baudricourt, governor of Vaucouleurs, an introduction to the dauphin Charles. In all her subsequent acts she professed to be guided by the voices of the saints, who had set before her the twofold task of relieving Orleans and crowning the young dauphin at Rheims. By persistent importunity, the effect of which was increased by the simplicity of her demeanor and her calm assurance of success, she at last prevailed on the governor to grant her request; and in February, 1429, accompanied by two knights, she set out on her perilous journey to the court of the dauphin at Chinon. At first Charles refused to see her, but the rising tide of popular feeling in her favor induced his advisers to persuade him after three days to grant her an interview. Of the divinity of her commission she is said to have persuaded him by discovering him though disguised in the crowd of his courtiers, and by assuring him regarding his secret doubts as to his legitimacy. Accordingly, after a commission of doctors had reported that they had found in her nothing of evil or contrary to the Catholic faith, and a council of matrons had reported on her chastity and virginity, she was permitted to set forth with an army of 4000 or 5000 men designed for the relief of Orleans. At the head of the army she rode clothed in a coat of mail, armed with an ancient sword which she had divined to be hidden near the altar of St. Catherine de Fierbois, and carrying a white standard of her own design embroidered with lilies and having on the one side the image of God seated on the clouds and holding the world in his hand, and on the other the representation of the annunciation. Joan was of medium height, stoutly built, but finely proportioned; and her frame was capable of enduring great fatigue. Notwithstanding subsequent traditions, she does not appear to have been strikingly handsome. Conventional beauty of the highest type could not be expected in one accustomed to her mode of life, but the most authentic testimonies represent her as less comely than many in her own station. Her features were, moreover, expressive rather of rustic honesty and innocence than of mental power, although she is said to have possessed grand melancholy eyes which, probably on account of the high and noble purpose which animated them, exercised an indescribable charm.[1] Her voice was powerful, but at the same time of great sweetness, and her manner possessed a fine natural dignity and grace, which, while it repelled familiarity, softened and subdued even the rudest of the soldiers. Nominally, she had been entrusted with the command of the army, but in reality it was under the direction of experienced generals; and it cannot be pretended that the victories accomplished in consequence of her co-operation were the result of brilliant military genius. Indeed, the blind obstinacy with which in the face of overwhelming odds she refused to acknowledge defeat place it beyond doubt that she was unable to estimate the elements of success in battle, and was actuated throughout by a fatalistic persuasion that victory was inevitable if she persevered unflinchingly in her efforts to obtain it. At the same time she possessed a shrewd and penetrating judgment both as to men and things, and the manner in which she conducted herself amid the varied difficulties of her career indicated extraordinary force of character and high and noble pruduce. What, however, she chiefly supplied to the French cause was concentrated energy and resolution. Above all, she inspired the soldiery with a fanatic enthusiam armed with the sanctions and ennobled by the influences of religion; and she overawed the enemy by the superstitious fear that she was in league with supernatural powers.

---

[1] In the Act of ennoblement the name is spelt Day, due probably to the peculiar current pronunciation. It has been disputed whether the name was written originally d'Arc or Darc. It is beyond doubt that the father of Joan was not of noble origin, but Bouteiller suggests that at that period the apostrophe did not indicate nobility.

By a remarkable stroke of good luck Joan succeeded in entering Orleans on the 29th April, 1429, and through the vigorous and unremitting attacks of the French the English gradually became so discouraged, that on the 8th of May they raised the siege. By the capture of Jargeau and Beaugency, followed by the great victory of Patay, where Talbot was taken prisoner, the English were driven beyond the Loire. With some difficulty the king was then persuaded to set out towards Rheims, which he entered with an army of 12,000 men on July 16th, Troyes having on the way been taken by assault at the sole instigation of the Maid. On the following day, holding the sacred banner, she stood next to Charles at his coronation in the cathedral. After an endeavor to detach Burgundy from the English cause, the king at last agreed to attempt the capture of Paris, but on account of the disastrous result of an attack made on the 8th September, in which Joan was wounded, he resolved, notwithstanding her passionate remonstrance, to withdraw from the city, and disbanded his troops. Joan went into Normandy to assist the duke of Alençon, but in December returned to the court, and on the 29th she and her family were ennobled with the surname of du Lis. Unconsoled by such honors, she rode away from the court in March, to assist in the defence of Compiègne against the duke of Burgundy; and on the 24th May she led an unsuccessful sortie against the besiegers, when, on account of her determination to fight to the last, she was surrounded and taken prisoner. Charles, partly perhaps on account of his natural indolence, partly on account of the intrigues at the court, made no effort to effect her ransom, and never showed any sign of interest in her fate. Probably he had found her so difficult to manage and control that he as well as the generals regarded her presence with the army as more embarrassing than helpful; and doubtless her capture dissipated the halo of supernatural power that had surrounded her. By means of negotiations instigated and prosecuted with great perseverance by the university of Paris and the Inquisition, and through the persistent scheming of Pierre Cauchon, the ejected bishop of Beauvais, she was sold in November by Luxembourg and Burgundy to the English, who on January 3, 1431, at the instance of the university of Paris, delivered her over to the Inquisition for trial. After a public examination, begun on the 9th January and lasting six days, and another conducted in the prison, she was, on the 20th March, publicly accused as a heretic and sorcerer, and, being in the end found guilty, she made her submission at the scaffold on the 24th May, and received pardon. She was still, however, the prisoner of the English, and, having been induced by those who had her in charge to resume her male clothes, she was on this account judged to have relapsed, was sentenced to death, and burned at the stake on the streets of Rouen, May 30, 1431. The sentence was revoked by the pope on the 7th July, 1456, and since then it has been the custom of Catholic writers to uphold the reality of her divine inspiration. In 1436 an impostor appeared, professing to be Joan of Arc escaped from the flames, who succeeded in inducing many people to believe in her statement, but afterwards confessed her imposture.

---

[1] On the personal appearance of the Maid, see especially E. de Bouteiller, *Notes Iconographiques sur Jeanne d'Arc*, 1879, containing engravings of the most authentic statues.

There is no doubt that Joan herself believed in her supernatural guidance, and her judges, notwithstanding all their efforts, were unable to bring to light the smallest semblance of a sign of conscious dishonesty on her part. At the same time the nobility of her purpose was unstained by the faintest symptom of selfish regard to her own fame and glorification. Indeed the greatness of her career did not consist in her military achievements, but in her pure, true, and ardent character, which made her a pathetic victim to the mean and grovelling aims of those in whose cause she fought with such simple sincerity of faith, and to the cruelties of a superstitious age.

Literature.—All previous works on Joan of Arc were deprived of a great part of their critical value by the publication, in 5 vols., 1841–49, of the *Procès de condamnation et de réhabilitation de Jeanne d'Arc*, edited by J. Quicherat. The record of the *Procès de condamnation* consisted originally of the official notes of the trial, afterwards edited in Latin by P. Cauchon, and bears internal marks of general truthfulness. The original French minute does not exist except in a fragment which has been reproduced by M. Vallet de Viriville in his French translation of the Latin version, published in 1867. A French translation of the *Procès de condamnation* and *Procès de réhabilitation* by E. O'Reilly appeared in 1868. The 4th vol. of Quicherat is occupied with old chronicles and histories, the principal of which are those of *Percival de Cagny*, a retainer of the duke of Alençon, never before published; *Jacques le Bouvier* (Berri), that from 1402-1411 first published in 1653 as part of a history of Charles VI., and the remainder, 1411–1444, in the collection of Denis Godefroy, 1661; *Jean Chartier*, only contemporaneous from 1437, before which it borrows chiefly from the *Chronique de la Pucelle* and Le Bouvier, what it does not borrow being utterly untrustworthy, published 1476–77, 1493, 1514, 1517–18, by Denis Godefroy, 1661, and Vallet de Viriville, with notes, 1858; *Journal du Siége d'Orléans*, founded on the chronicles of Berri and Jean Chartier, with a few other documents, published 1576, 1606, 1611, 1619, 1621, and reprinted with notes by Jacob in 1855; *la Geste des nobles François*, or *Chronique de Cousinot*, which closes with 1429, but some years afterwards was completed by a nephew of Cousinot to the siege of Paris so as to form the *Chronique de la Pucelle*, published by Denis Godefroy, 1661, by M. Petitot, 1825, in vol. viii. of *Mémoires relatifs a l'histoire de France*, and with notes by Vallet de Viriville, 1859; *Chronique d'Enguerran de Monstrelet*, first published about 1500 and very frequently afterwards, English translation by Thomas Johnes, 1840, the last and best French edition, that of L. Douët d'Arcq, 6 vols., 1857–62. The principal other contemporary authorities are Basin's *Histoire des Règnes de Charles VII. et de Louis XI.*, first published in a complete form by Quicherat, with notes and life, 4 vols., 1855–1859; the *Chronique Normande* of Pierre Cochon, the part referring to Joan published along with *Chronique de la Pucelle* by Vallet de Viriville, 1859, the whole by De Robillard de Beaurepaire, 1870; *Chronique de Robert Blondel*, first published by Vallet de Viriville, 1859; *Chronique de Jean Raoult*, or *Chronique anonyme de Charles VII.*, first published by Vallet de Viriville, 1858; *Abregé d'Histoire chronologique*, by Denis Godefroy, 1661; *Le Mystère du Siége d'Orléans*, in verse, published from a manuscript in the Vatican in *Collection de Documents inédits sur l'Histoire de France*, 1862; a Latin poem by Valesan Vasanius, 1501; an anonymous Latin poem, manuscript 5970 of the Imperial Library of Paris; a poem by Christine de Pisan, 1429, printed in 1865; Martial Auvergne, *Les Vigilles du roy Charle*, in verse, 1505—one hundred copies of the portion relating to Joan of Arc printed at Orleans, 1866, of which one copy is in the British Museum.

The earliest life by other than contemporaries is that in Latin by Jean Hordal, 1612. Edmond Richer, who had procured the original documents of the *Procès*, finished a life of Joan in 1628 which was never published, but of which Lenglet-Dufresnoy made use to correct his own work, published in 1754 in two volumes. Charles du Lys, a descendant of her kin, published *D'l'extraction et parenté de la Pucelle d'Orléans*, 1611, enlarged edition 1612, 3d in 1628, all of which were republished by Vallet de Viriville in *Trésor des pièces rares et anciennes*, 1856. In 1790 L'Averdy published an analysis of the manuscript of the *Procès* in the 3d vol. of *Mémoires* of the Academy of Inscriptions. The principal other works previous to the publication of the *Procès* are those of Lebrun des Charmettes, 1817, 4 vols.; Saint-Prix, 1817; Lemaire, 1818; Jollois, 1821; Dumas, 1843; De Beauregard, 1847; and the accounts by De Barante, Michelet, and Sismondi in their several histories. Since the publication of the *Procès* the works of original critical value are *Apercus Nouveaux* by J. Quicherat, 1850; the lives by B. Henri Martin, last ed., 1875; Wallon, 1860; and Villiaumé, 1863. Other lives have been written by Lamartine, 1852; Lafontaine, 1854; Desjardins, 1854; Michaud, 1861; Sepet, 1869. See also Vallet de Viriville, *Recherches sur la famille de Jeanne d'Arc*, 1854; *Histoire de Charles VII.*, by the same, 3 vols., 1862-65; De Robillard de Beaurepaire, *Recherches sur le procès de condamnation de Jeanne d'Arc*, 1869; Boucher de Molandon, *Première Expédition de Jeanne d'Arc*, 1874; E. de Bouteiller, *Jeanne d'Arc dans les chroniques Missines de P. Vigneulles*, 1878; and E. de Bouteiller and G. de Braux, *La famille de Jeanne d'Arc*, 1878, *Nouvelles Recherches sur la famille de Jean d'Arc*, 1879, and *Notes Iconographiques*, 1879. The principal German works are those of Görres, 2d ed., 1835 (French transl., 1843); Hase, 1861; Eysell, 1861; and Hirzell, 1877. In English, in addition to the essays of De Quincey and Lord Mahon, there are lives by Harriet Parr, 1866; Mrs. Bray, 1874; and Janet Tuckey, 1880. Of the numerous dramas and poems of which Joan of Arc has been the subject, mention can only be made of *Die Jungfrau von Orleans* of Schiller, the *Joan of Arc* of Southey, and the scandalous burlesque-epic of Voltaire. A drama in verse by Jules Barbier has been set to music by C. Gounod, 1873.

JOB. The book of Job (Heb. אִיּוֹב *Iyyob*, Gr. 'Ιώβ), the most splendid creation of the Hebrew poetry, is so called from the name of the man whose history and afflictions and sayings form the theme of it.

Contents.—As it now lies before us it consists of five parts, 1. The prologue, in prose, ch. i.–ii., describes in rapid and dramatic steps the history of this man, his piety and prosperity and greatness corresponding to his godliness; then how his life is drawn in under the operation of the trying sifting providence of God, through the suspicion suggested by the Satan, the minister of this aspect of God's providence, that his godliness is but selfish and only the natural return for the unexampled prosperity bestowed upon him, and the insinuation that if stripped of his prosperity he will renounce God to his face. These suspicions bring down two severe calamities on Job, one depriving him of all external blessings, children and possessions alike, and the other throwing the man himself under a loathsome and painful malady. In spite of these afflictions Job retains his integrity and ascribes no wrong to God. Then the advent of Job's three friends is described, Eliphaz the Temanite, Bildad the Shuhite, and Zophar the Naamathite, who, having heard of Job's calamities, come to condole with him. 2. The body of the book, in poetry, ch. iii.–xxxi., contains a series of speeches in which the problem of Job's afflictions and the relation of external evil to the righteousness of God and the conduct of men is brilliantly discussed. This part is divided into three cycles, each containing four speeches, one by Job and one by each of the friends (ch. iii.–xiv.; ch. xv.–xxi.; ch. xxii.–xxxi.), although in the last cycle the third speaker Zophar fails to answer, and Job, having driven his opponents from the field, carries his reply through a series of discourses in which he dwells in pathetic words upon his early prosperity, contrasting with it his present misery and humiliation, and ends with a solemn repudiation of all the offences that had been insinuated or might be suggested against him, and a challenge to God to appear and put His hand to the charge which He had against him and for which He afflicted him. 3. A youthful bystander named Elihu, the representative of a younger generation, who had been a silent observer of the debate, intervenes and expresses his dissatisfaction with the manner in which both Job and his friends had conducted the cause, and offers what is in some respects a new solution of the question (ch. xxxii.–xxxvii.). 4. In answer to Job's repeated demands that God would appear and solve the riddle of his life, the Lord answers Job out of the whirlwind. The Divine speaker does not condescend to refer to Job's individual problem, but in a series of ironical interrogations asks him, as he thinks himself capable of fathoming all things, to expound the mysteries of the origin and subsistence of the world, the phenomena of the atmosphere, the instincts of the creatures that inhabit the desert, and, as he judges God's conduct of the world amiss, invites him to seize the reins himself and gird him with the Divine thunder and quell the rebellious forces of evil in the universe (ch. xxxviii.–xlii. 6). Job is humbled and abashed, and lays his hand upon his mouth, and repents his hasty words in dust and ashes. No solution of his problem is vouchsafed; but God Himself effects that which neither the man's own thoughts of God nor the representations of the friends could accomplish: he heard of Him with the hearing of the ear without effect, but now his eye saw Him. This is the profoundest religious deep in the book. 5. The epilogue, also in prose, ch. xlii. 7–17, describes Job's restoration to a prosperity double that of his former estate, his family felicity, and long life.

Design.—With the exception of the episode of Elihu, the connection of which with the original form of the poem may be doubtful, all these five parts are essential elements of the work as it came from the hand of the first author, although some parts of the second and fourth divisions may have been expanded by later writers. The idea of the composition is not to be derived from any single element of the book, as from the prologue, but from the teaching and movement of the whole piece. Job is unquestionably the hero of the work, and in the ideas which he expresses and the history which he passes through combined we may assume that we find the author himself speaking and teaching. The discussion of the question of suffering between Job and his friends occupies two-thirds of the book, or, if the space occupied by Elihu be not considered, nearly three-fourths, and in the direction which the author causes this discussion to take we may see revealed the main didactic purpose of the book. When the three friends, the representatives of former theories of providence, are reduced to silence and driven off the ground by Job, we may be certain that it was the author's purpose to discredit the ideas which they represent. Job himself offers no positive contribution to the doctrine of evil; his position is negative, and merely antagonistic to that of the friends. But this negative position victoriously maintained by him has the effect of clearing the ground, and the author himself supplies in the prologue the positive truth, when he communicates the real explanation of his hero's calamities, and teaches that they were a trial of his righteousness. It was therefore the author's purpose in his work to widen men's views of the providence of God and set before them a new view of suffering. This may be considered the first great object of the book. This purpose, however, was in all probability no mere theoretical one, but subordinate to some wider practical design. No Hebrew writer is merely a poet or a thinker. He is always a teacher. He has men before him in their relations to God. And it is not usually men in their individual relations, but as members of the family of Israel, the people of God. It is consequently scarcely to be doubted that the book has a national scope. The author considered his new truth regarding the meaning of affliction as of national interest, and to be the truth needful for the heart of his people in their circumstances. But the teaching of the book is only half its contents. It contains also a history—deep and inexplicable affliction, a great moral struggle, and a victory. The author meant his new truth to inspire new conduct, new faith, and new hopes. In Job's sufferings, undeserved and inexplicable to him, yet capable of an explanation most consistent with the goodness and faithfulness of God, and casting honor upon his faithful servants; in his despair bordering on unbelief, at last overcome; and in the happy issue of his afflictions—in all this Israel may see itself, and from the sight take courage, and forecast its own history. Job, however, is not to be considered Israel, the righteous servant of the Lord, under a feigned name; he is no mere parable (though such a view is found as early as the Talmud); he and his history have both elements of reality in them. It is these elements of reality common to him with Israel in affliction, common even to him with humanity as a whole, confined within the straitened limits set by its own ignorance, wounded to death by the mysterious sorrows of life, tortured by the uncertainty whether its cry finds an entrance into God's ear, alarmed and paralyzed by the irreconcilable discrepancies which it seems to discover between its necessary thoughts of Him and its experience of Him in His providence, and faint with longing that it might come into His place, and behold Him, not girt with His majesty, but in human form, as one looketh upon his fellow,—it is these elements of truth that make the history of Job instructive to Israel in the times of affliction when it was set before them, and to men in all ages. It would probably be a mistake, however, to imagine that the author consciously stepped outside the limits of his nation, and assumed a human position antagonistic to it. The chords he touches vibrate through all humanity; but this is because Israel is the kernel of humanity, and because from Israel's heart the deepest music of mankind is heard, whether of pathos or of joy.

Two threads requiring to be followed, therefore, run through the book,—the one the discussion of the problem of evil between Job and his friends, and the other the varying attitude of Job's mind towards Heaven, the first being subordinate to the second. Both Job and his friends advance to the discussion of his sufferings and of the problem of evil, ignorant of the true cause of his calamities,—Job strong in his sense of innocence, and the friends armed with their theory of the righteousness of God, who giveth to every man according to his works. With fine psychological instinct the poet lets Job altogether lose his self-control first when his three friends, the men his fellows, came to visit him. His bereavements and the acute anguish of his malady he bore with a steady courage, and the direct instigations to godlessness of the woman, his wife, he repelled with severity and resignation. But when men, his equals and the old associates of his happiness, came to see him, and when he read in their looks and in their seven days' silence the depth of his own misery, his self-command deserted him, and he broke out into a cry of despair, cursing his day and crying for death (ch. iii.). Job had somewhat misinterpreted the demeanor of his friends. It was not all pity that it expressed. Along with their pity they had also brought their theology with them, and they trusted to heal Job's malady with this. Till a few days ago Job would have agreed with them on the sovereign virtues of this remedy. But he had learned through a higher teaching, the events of God's providence, that it was no more a specific in his case. His violent impatience, however, under his afflictions and his covert attacks upon the divine rectitude only served to confirm the view of his sufferings which their theory of evil had already suggested to his friends. And thus commences the high debate which continues through thirty chapters of the book.

The principle with which the three friends of Job came to the consideration of his history was the principle that calamity is the result of evil-doing, as on the other hand prosperity is the reward of righteousness. Suffering is not an accident or a spontaneous growth of the soil; man is born unto trouble as the sparks fly upwards; there is in human life a tendency to do evil which draws down upon men the chastisement of Heaven (ch. v. 6). The form in which the principle is enunciated by Eliphaz, from whom the other speakers take their cue, is this: where there is suffering there has been sin in the sufferer, not necessarily deadly sin, though where the suffering is great the sin must have been heinous. Not suffering in itself, but the effect of it on the sufferer is what gives insight into his true character. Suffering is not always punitive; it is far oftener disciplinary, designed to wean the good man from his sin. If he sees in his suffering the monition of God and turns from his evil, his future shall be rich in peace and happiness, and his latter estate more prosperous than his first. If he murmurs or resists, he can only perish under the multiplying chastisements which his impenitence will provoke. Now this principle of the friends is far from being a peculiar crotchet of theirs; its truth is undeniable, though they erred in supposing it a principle that would cover the wide providence of God. The principle is the fundamental idea of moral government, the expression of the natural conscience, a principle common more or less to all peoples, though perhaps more prominent in the Semitic mind, because all religious ideas are more prominent and simple there,—not suggested to Israel first by the law, but found and adopted by the law, though it may be sharpened by it. It is the fundamental principle of prophecy no less than of the law, and, if possible, of the wisdom or philosophy of the Hebrews more than of either. Speculation among the Hebrews had a simpler task before it than it had in the West or in the further East. The Greek philosopher began his operations upon the sum of things; he threw the universe into his crucible at once. His object was to effect some analysis of it, such an analysis that he could call one element cause and another effect. Or, to vary the figure, his endeavor was to pursue the streams of tendency which he could observe upwards till he reached at last the central spring which sent them all forth. God, a single cause and explanation, was the object of his search. But to the Hebrew this was already found. The analysis resulting in the distinction of God and the world had been effected for him long ago, so long that the history and circumstances of the process had been forgotten, and only the unchallengeable result remained. His philosophy was not a quest of God whom he did not know, but a recognition on all hands of God whom he knew. The great primary idea to his mind was that of God, a Being wholly just, doing all. And the world was little more than the phenomena that revealed the mind and the presence and the operations of God. Consequently the nature of God as known to him and the course of events formed a perfect equation. The idea of what God was in Himself was in complete harmony with His manifestation of Himself in providence, in the events of human life, and the history of men and nations. The philosophy of the wise did not go behind the origin of sin, or referred it to the freedom of man; but, sin existing, and God being in immediate personal contact with the world, every event was a direct expression of His moral will and energy; calamity fell on wickedness, and success attended right-doing. This view of the moral harmony between the nature of God and the events of providence in the fortunes of men and nations is the view of the Hebrew wisdom in its oldest form, during what might be called the period of principles, to which belong Prov. x. *sq.;* and this is the position maintained by Job's three friends. And the significance of the book of Job in the history of revelation arises from this, that it marks the point when such a view was definitely overcome, closing the long period when this principle was merely subjected to questionings, and makes a new positive addition to the doctrine of evil.

Job agreed with the friends that afflictions came directly from the hand of God, and also that God afflicted those whom He held guilty of sins. But his conscience denied the imputation of guilt, whether insinuated by his friends or implied in God's chastisement of him. Hence he was driven to conclude that God was unjust, that He sought occasions against him, and perverted his right. The position of Job appeared to his friends nothing else but impiety, as it came very near being; while theirs was to him mere falsehood and the special pleading of sycophants in behalf of God because He was the stronger. Within these two iron walls the debate moves, making little progress, but with much brilliancy, if not of argument, of illustration. A certain advance indeed is perceptible. In the first series of speeches, ch. iv.-xiv., the keynote of which is struck by Eliphaz, the oldest and most considerate of the three, the position is that affliction is caused by sin, and is chastisement designed for the sinner's good; and the moral is that Job should recognize it and use it for the purpose for which it was sent. In the second, ch. xv.-xxi., the other side of the picture is held up, the terrible fate of the sinner, and those brilliant pictures of a restored future, thrown in by all the speakers in the first series, are absent. Job's demeanor under the consolations offered him afforded little hope of his repentance. In the third series, ch. xxii. *sq.*, the friends cast off all disguise, and openly charge Job with a course of evil life. That their armory was now exhausted is shown by the brevity of the second speaker, and the failure of the third to answer in any form. In reply Job disdains for a time to touch what he well knew lay under all their exhortations; he laments with touching pathos the defection of his friends on whom he counted, who were like the winter torrents looked for in vain by the perishing caravan in the summer heat; he meets with bitter scorn their constant cry that God will not cast off the righteous man, by asking—How can one be righteous with God? what can human weakness, however innocent, do against infinite might and subtlety? they are righteous whom an omnipotent and perverse will thinks fit to consider so; he falls into a hopeless wail over the universal misery of man, who has a weary campaign of life appointed him; then, rising up in the strength of his conscience, he upbraids the Almighty with His misuse of His power and His indiscriminate tyranny,—righteous and innocent He destroys alike—and challenges Him to lay aside His majesty and meet His creature as a man, and then he would not fear Him. Even in the second series Job can hardly bring himself to face the personal issue raised by the friends. His relations to God absorb him almost wholly,—his pitiable isolation, the indignities showered on his once honored head, the loathsome spectacle of his body; and, abandoned by all, he turns for pity from God to men and from men to God. Only in the third series of debates does he put out his hand and grasp firmly the theory of his friends, and their "defences of mud" fall to dust in his hands. Instead of that roseate moral order which they are never weary insisting upon, he finds only disorder and moral confusion. When he thinks of it, trembling takes hold of him. It is not the righteous but the wicked that live, grow old, yea wax mighty in strength, that send forth their children like a flock and establish them in their sight. Before the logic of facts the theory of the friends goes down; and with this negative result, which the author skilfully reaches through the debate, has to be combined his own positive doctrine of the uses of adversity advanced in the prologue.

To a reader of the poem now it appears strange that both parties were so entangled in the meshes of their preconceptions regarding God as to be unable to break through to broader views. The friends, while maintaining their position that injustice on the part of God is inconceivable, might have given its due weight to the persistent testimony of Job's conscience as that behind which it is impossible to go, and found refuge in the reflection that there might be something inexplicable in the ways of God, and that affliction might have some other meaning than to punish the sinner or even to wean him from his sin. And Job, while maintaining his innocence from overt sins, might have bowed beneath the rod of God and confessed that there was such sinfulness in every human life as to account for the severest chastisement from Heaven, or at least have stopped short of charging God foolishly. Such a position would certainly be taken up by an afflicted saint now, and such an explanation of his sufferings would suggest itself to the sufferer, even though it might be in truth a false explanation. Perhaps here, where an artistic fault might seem to be committed, the art of the writer, or what is the same thing his truth to nature, and the extraordinary freedom with which he moves among his materials, as well as the power and individuality of his dramatic creations, are most remarkable. It was the rôle which the author reserved for himself to teach the truth on the question in dispute, and he accomplishes this by allowing his performers to push their false principles to their proper extreme. There is nothing about which men are usually so sure as about God. They are ever ready to take Him in their own hand, to interpret His providence in their own sense, to say what things are consistent or not with His character and word, and beat down the opposing consciences of other men, by His so-called authority, which is nothing but their own. The friends of Job were religious Orientals, men to whom God was a Being in immediate contact with the world and life, effecting all things with no intervention of second causes, men to whom the idea of second causes was unknown, on whom science had not yet begun to dawn, nor the conception of a divine scheme pursuing a distant end by complicated means, in which the individual's interest may suffer for the larger good. The broad sympathies of the author and his sense of the truth lying in the theory of the friends are seen in the scope which he allows them, in the richness of the thought and the splendid luxuriance of the imagery—drawn from revelation, the immemorial moral consent of mankind, the testimony of the living conscience, and the observation of life—with which he makes them clothe their views. He felt it needful to make a departure from a position too narrow to confine the providence of God within, but he remembered the elements of truth in the theory which he was departing from, that it was a national heritage, which he himself perhaps had been constrained not without a struggle to abandon; and, while showing its insufficiency, he sets it forth in its most brilliant form.

Then, in regard to the position maintained by Job,—the extravagance of his assertions was occasioned greatly by the extreme position of his friends, which left no room for his conscious innocence along with the rectitude of God. Again, the poet's purpose, as the prologue shows, was to teach that afflictions may fall on a man out of all connection with any offence of his own, and merely as the trial of his righteousness; and hence he allows Job, as by a true instinct of the nature of his sufferings, to repudiate all connection between them and sin in himself. And further, the terrible conflict into which the suspicions of the Satan brought Job could not be exhibited without pushing him to the verge of ungodliness. These are all elements of the poet's art; but art and nature are one. Under the Old Covenant the sense of sin was less deep than it is now. In the desert, too, men speak boldly of God. Such a creation as Job would be an anomaly in Christianity. But nothing is more false than to judge the poet's creation from our later point of view, and construct a theory of the book according to a more developed sense of sin and a deeper reverence of God than belonged to antiquity. In complete contradiction to the testimony of the book itself, some theorists, as Hengstenberg, have assumed that Job's spiritual pride was the just cause of his afflictions, that this was the root of bitterness in him which must be killed down ere he could become a true saint. The fundamental position of the book is that Job was already a true saint; this is testified by God Himself, is the radical idea of the author in the prologue, and the very hypothesis of the drama. We might be ready to think that Job's afflictions did not befall him out of all connection with his own condition of mind, and we might be disposed to find a vindication of God's ways in this. There is no evidence that such an idea was shared by the author of the book. The interpretation of Job has suffered not a little from the righteousness overmuch of its expounders. The writer did not consider that God's ways needed this vindication. The confession of sin which he puts into Job's mouth had reference exclusively to his demeanor under his afflictions. This demeanor may be evidence of the imperfection of his previous religious state. It is evidence of this, of which, however, no evidence was needed, for Job does not claim to be nor is he supposed sinless, but it is no evidence that this imperfection was the cause of his afflictions. These were the trial of his faith, which, maintaining itself in spite of them, and becoming stronger through them, was rewarded with a higher felicity. It is remarkable that the attitude which we imagine it would have been so easy for Job to assume, viz., while holding fast his integrity, to fall back upon the inexplicableness of Providence, of which there are such imposing descriptions in his speeches, is just the attitude which he takes up in ch. xxviii. It is far from certain, however, that this chapter is an integral part of the original book.

The other line running through the book, the varying attitude of Job's mind towards Heaven, exhibits dramatic action and tragic interest of the highest kind, though the movement is internal. That the exhibition of this struggle in Job's mind was a main point in the author's purpose is seen from the fact that at the end of each of his great trials he notes that Job sinned not, nor ascribed wrong to God (ch. i. 22; ii. 10), and from the effect which the divine voice from the whirlwind is made to produce upon him (ch. xl. 3). In the first cycle of debate (ch. iv.–xiv.), Job's mind reaches the deepest limit of estrangement. There he not merely charges God with injustice, but, unable to reconcile His former goodness with His present enmity, he regards the latter as the true expression of the divine mind towards His creatures, and the former, comprising all His infinite creative skill in weaving the delicate organism of human nature and the rich endowments of His providence, but as the means towards exercising His mad and immoral cruelty in the time to come. When the Semitic skin of Job is scratched, we find a modern pessimist beneath. Others in later days have brought the keen sensibility of the human frame and the torture which it endures together, and asked with Job to whom at last all this has to be referred. Towards the end of the cycle a star of heavenly light seems to rise on the horizon; the thought seizes the sufferer's mind that man might have another life, that God's anger pursuing him to the grave might be sated, and that He might call Him out of it to Himself again (ch. xiv. 13). This idea of a resurrection, unfamiliar to Job at first, is one which he is allowed to reach out of the necessities of the moral complications around him, but from the author's manner of using the idea we may judge that it was not unfamiliar to himself. In the second cycle the thought of a future reconciliation with God (for of course he regarded his afflictions as evidence of God's anger) is more firmly grasped. That satisfaction or at least composure which, when we observe calamities that we cannot morally account for, we reach by reflecting that providence is a great scheme moving according to general laws, and that it does not always truly reflect the relation of God to the individual, Job reached in the only way possible to a Semitic mind. He drew a distinction between God and God, between an outer God whom events obey, pursuing him in His anger, and an inner God whose heart was with him, who was conscious of his innocence; and he appeals from God to God, and beseeches God to pledge Himself that he shall receive justice from God (ch. xvi. 19; xvii. 3). And so high at last does this consciousness that God is at one with him rise that he avows his assurance that He will yet appear to do him justice before men, and that he shall see Him with his own eyes, no more estranged but on his side, and for this moment he faints with longing (ch. xix. 25 *sq.*).[1]

After this expression of faith Job's mind remains calm, though he ends by firmly charging God with perverting his right, and demanding to know the cause of his afflictions (ch. xxvii. 2 *sq.*; xxxi. 35, where render, Oh, that I had the indictment which mine adversary has written). In answer to this demand the Divine voice answers Job out of the tempest—Who is this that darkeneth counsel by words without knowledge? The word "counsel" intimates to Job that God does not act without a design, large and beyond the comprehension of man; and to impress this is the purpose of the Divine speeches. The speaker does not enter into Job's particular cause; there is not a word tending to unravel his riddle; his mind is drawn away to the wisdom and majesty of God Himself. His own words and those of his friends are but re-echoed, but it is God Himself who now utters them. Job is in immediate nearness to the majesty of heaven, wise, unfathomable, ironical over the littleness of man, and he is abased; God Himself effects what neither the man's own thoughts of God nor the representations of his friends could accomplish, though by the same means. The religious insight of the writer sounds here the profoundest deeps of truth.

Integrity.—Doubts whether particular portions of the present book belonged to the original form of it have been raised by many. Half a century ago De Wette expressed himself as follows: "It appears to us that the present book of Job has not all flowed from one pen. As many books of the Old Testament have been several times written over, so has this also" (Ersch and Gruber, *Encyk.*, sect. ii., vol. viii.). The judgment formed by De Wette has been adhered to more or less by most of those who have studied the book. Questions regarding the unity of such books as this are difficult to settle; there is not unanimity among scholars regarding the idea of the book, and consequently they differ as to what parts are in harmony or conflict with unity; and it is dangerous to apply modern ideas of literary composition and artistic unity to the works of antiquity and of the East. The problem raised in the book of Job has certainly received frequent treatment in the Old Testament; and there is no likelihood that all efforts in this direction have been preserved to us. It is probable that the book of Job was but a great effort amidst or after many smaller. It is scarcely to be supposed that one with such poetic and literary power as the author of chap. iii.–xxxi., xxxviii.–xli. would embody the work of any other writer in his own. If there be elements in the book which must be pronounced foreign, they have been inserted in the work of the author by a later hand. It is not unlikely either in itself or when the history of other books is considered that our present book may, in addition to the great work of the original author, contain some fragments of the thoughts of other religious minds upon the same question, and that these, instead of being loosely appended, have been fitted into the mechanism of the first work. Some of these fragments may have originated at first quite independently of our book, while others may be expansions and insertions that never existed separately. At the same time it is scarcely safe to throw out any portion of the book merely because it seems to us out of harmony with the unity of the main part of the poem, or unless several distinct lines of consideration conspire to point it out as an extraneous element.

---

[1] This remarkable passage reads thus: "*But I know that my redeemer liveth, and afterwards he shall arise upon the dust, and after my skin* even *this* body *is destroyed, without my flesh shall I see God; whom I shall see for myself, and mine eyes shall behold, and not as a stranger; my reins within me are consumed* with longing." The redeemer who liveth and shall arise or stand upon the earth is God whom he shall see with his own eyes, on his side. The course of exegesis was greatly influenced by the translation of Jerome, who, departing from the Itala, rendered: "In novissimo die de terra surrecturus sum. . . . et rursum circumdabor pelle mea et in carne mea videbo deum meum." The only point now in question is whether—(*a*) Job looks for this manifestation of God to him while he is still alive, or (*b*) after death, and therefore in the sense of a spiritual vision and union with God in another life; that is, whether the words "destroyed" and "without my flesh" are to be taken relatively only, of the extremest effects of his disease upon him, or literally, of the separation of the body in death. A third view which assumes that the words rendered "without my flesh," which run literally, "out of my flesh," mean *looking* out from my flesh, that is, clothed with a new body, and finds the idea of resurrection repeated, perhaps imports more into the language than it will fairly bear. In favor of (*b*) may be adduced the persistent refusal of Job throughout to entertain the idea of a restoration in this life; the word "afterwards;" and perhaps the analogy of other passages where the same situation appears, as Ps. xlix. and lxxiii., although the actual dénouement of the tragedy supports (*a*). The difference between the two senses is not important, when the Old Testament view of immortality is considered. To the Hebrew the life beyond was not what it is to us, a freedom from sin and sorrow and admission to an immediate divine fellowship not attainable here. To him the life beyond was at best a prolongation of the life here; all he desired was that his fellowship with God here should not be interrupted in death, and that Sheol, the place into which deceased persons descended and remained, cut off from all life with God, might be overleapt. On this account the theory of Ewald, which throws the centre of gravity of the book into this passage in ch. xix., considering its purpose to be to teach that the riddles of this life shall be solved and its inequalities corrected in a future life, appears one-sided. The point of the passage does not lie in any distinction which it draws between this life and a future life; it lies in the assurance which Job expresses that God who even now knows his innocence, will vindicate it in the future, and that, though estranged now, He will at last take him to His heart.

The arguments that have been used against the originality of the prologue—as, that it is written in prose, that the name Jehovah appears in it, that sacrifice is referred to, and that there are inconsistencies between it and the body of the book—are of little weight. There must have been some introduction to the poem explaining the circumstances of Job, otherwise the poetical dispute would have been unintelligible, for it is improbable that the story of Job was so familiar that a poem in which he and his friends figured as they do here would have been understood. And there is no trace of any other prologue or introduction having ever existed. The prologue, too, is an essential element of the work, containing the author's positive contribution to the doctrine of suffering, for which the discussion in the poem prepares the way. The intermixture of prose and poetry is common in Oriental works containing similar discussions; the reference to sacrifice is to primitive not to Mosaic sacrifice; and the author, while using the name Jehovah freely himself, puts the patriarchal Divine names into the mouth of Job and his friends because they belonged to the patriarchal age and to a country outside of Israel. That the observance of this rule had a certain awkwardness for the writer perhaps appears from his allowing the name Jehovah to slip in once or twice (xii. 9, comp. xxviii. 28) in familiar phrases in the body of the poem. The discrepancies, such as Job's references to his children as still alive (xix. 17, the interpretation is doubtful), and to his servants, are trivial, and even if real, imply nothing in a book admittedly poetical and not history. The objections to the epilogue are equally unimportant,—as that the Satan is not mentioned in it, and that Job's restoration is in conflict with the idea of the poem that earthly felicity does not follow righteousness, and undoes its teaching. The epilogue confirms the teaching of the poem when it gives the Divine sanction to Job's doctrine regarding God in opposition to that of the friends (xlii. 7). And it is certainly not the intention of the poem to teach that earthly felicity does not follow righteousness, but to correct the exclusiveness with which the friends of Job maintained that principle. The Satan is introduced in the prologue, exercising his function as minister of God in heaven; but it is to misinterpret the doctrine of evil in the Old Testament wholly to assign to the Satan any such personal importance or independence of power as that he should be called before the curtain to receive the hisses that accompany his own discomfiture. The Satan, though he here appears with the beginnings of a malevolent will of his own, is but the instrument of the trying, sifting, providence of God. His work was to try; that done he disappears, his personality being too slightly important to have any place in the result.

Much graver are the suspicions that attach to the speeches of Elihu. It is the opinion of most of those who have studied the book carefully that this part does not belong to the original cast of it, but has been introduced at a considerably later time. The piece is one of the most interesting parts of the book; both the person and the thoughts of Elihu are marked by a strong individuality. This individuality has indeed been very diversely estimated. The ancients for the most part passed a very severe judgment on Elihu; he is a buffoon, or a boastful youth whose shallow intermeddling is only to be explained by the fewness of his years, the incarnation of folly, or even the Satan himself gone a-mumming. Some moderns on the other hand have regarded him as the incarnation of the voice of God or even of God Himself. The main objections that may be urged against the connection of the episode of Elihu with the original book are—that the prologue and epilogue know nothing of him; that on the cause of Job's afflictions he occupies virtually the same position as the friends; that his speeches destroy the dramatic effect of the Divine manifestation by introducing a lengthened break between Job's challenge and the answer of God; that the language and style of the piece are marked by an excessive mannerism, too great to have been created by the author of the rest of the poem, even when introducing an interlocutor out of the ranks of the bystanders, and of another race; that the allusions to the rest of the book are so minute as to betray a reader rather than a hearer; and that the views regarding sin, and especially the scandal given to the author by the irreverence of Job, indicate a religious advance which marks a later age. The position taken by Elihu is almost that of a critic of the book. Regarding the origin of afflictions he is at one with the friends, although he dwells more on the general sinfulness of man than on actual sins, and his reprobation of Job's position is even greater than theirs. His anger was kindled against Job because he made himself righteous before God, and against his friends because they found no answer so as to condemn Job. His whole object is to refute Job's charge of injustice against Heaven. What is novel in Elihu, therefore, is not his position but entirely his arguments. These do not lack cogency, but betray a kind of thought different from that of the friends. Injustice in God, he argues, can only arise from selfishness in Him; but the very existence of creation implies unselfish love on God's part, for if He thought only of Himself, He would cease actively to uphold creation, and it would fall into death. Again, without justice mere earthly rule is impossible; how then is injustice conceivable in Him who rules over all? It is probable that the original author found his three interlocutors a sufficient medium for expressing all that he desired to say, and that this new speaker is the creation of another. To a devout and thoughtful reader of the original book, belonging perhaps to a more reverential age, it appeared that the language and bearing of Job had scarcely been sufficiently reprobated by the original speakers, and that the religious reason, apart from any theophany, could suggest arguments sufficient to condemn such demeanor on the part of any man.

It is more difficult to come to a decision in regard to some other portions of the book, particularly ch. xxvii. 7–xxviii. In the latter part of ch. xxvii. Job seems to go over to the camp of his opponents, and expresses sentiments in complete contradiction to his former views. Hence some have thought the passage to be the missing speech of Zophar. Others, as Hitzig, believe that Job is parodying the ideas of the friends; while others, like Ewald, consider that he is offering a recantation of his former excesses, and making such a modification as to express correctly his views on evil. None of these opinions is quite satisfactory, though the last probably expresses the view with which the passage was introduced, whether it be original or not. The meaning of ch. xxviii. can only be that "Wisdom," that is, a theoretical comprehension of providence, is unattainable by man, whose only wisdom is the fear of the Lord or practical piety. But to bring Job to the feeling of this truth was just the purpose of the theophany and the divine speeches; and, if Job reached it already through his own reflection, the theophany becomes an irrelevancy. It is difficult, therefore, to find a place for these two chapters in the original work. The hymn on Wisdom is a most exquisite poem, which probably originated separately, and was brought into our book with a purpose similar to that which suggested the speeches of Elihu. Objections have also been raised to the descriptions of leviathan and behemoth (ch. xl. 15–xli.). Regarding these it may be enough to say that in meaning these passages are in perfect harmony with other parts of the Divine words, although there is a breadth and detail in the style unlike the sharp, short, ironical touches, otherwise characteristic of this part of the poem.

Date.—The age of such a book as Job, dealing only with principles and having no direct references to historical events, can be fixed only approximately. Any conclusion can be reached only by an induction founded on matters which do not afford perfect certainty, such as the comparative development of certain moral ideas in different ages, the pressing claims of certain problems for solution at particular epochs of the history of Israel, and points of contact with other writings of which the age may with some certainty be determined. It may be said without doubt that the book belongs to the period between David and the return from exile. The Jewish tradition that the book is Mosaic, or the other idea that it is a production of the desert, written in another tongue and translated into Hebrew, wants even a shadow of probability. The book is a genuine outcome of the religious life and thought of Israel, the product of a religious knowledge and experience that was possible among no other people. That the author lays the scene of the poem outside his own nation and in the patriarchal age is a proceeding common to him with other dramatic writers, who find freer play for their principles in a region removed from the present, where they are not hampered by the obtrusive forms of actual life, but free to mould occurrences into the moral form that their ideas require.

It is the opinion of many scholars, *e.g.*, Delitzsch, that the book belongs to the age of Solomon. It cannot be earlier than this age, for Job (ch. vii. 17) travesties the ideas of Ps. viii. in a manner which shows that this hymn was well known. Undoubtedly many of the means and conditions necessary for its production existed in this age. It is a creation of that direction of thought known as the Wisdom, a splendid efflorescence of which distinguished this time, unless history and tradition alike are to be alogether discredited. The cosmopolitanism of Solomon's reign, and the close relations into which Israel then entered with Egypt, the further East, and even the West, may seem reflected in the poem, the author of which had seen many lands and strange peoples, and draws his illustrations from many distant sources. When, however, we compare Job with the literature of the Wisdom, presumably of the Solomonic age and even later, the difference is found to be extreme. Job is not only a creation of the Wisdom; it is its highest creation. The literature of the Wisdom falls into three periods:—the period of principles, referred to above, to which belongs the book of Proverbs; the period of problems, illustrated by such compositions as Ps. xxxvii., xlix., lxxiii., and others; and the period of exhaustion, where a solution of the problems was scarcely sought, and only a *modus vivendi* in the face of them, through a practical prudence, was aimed at, to which belongs Ecclesiastes. Job has no affinity with the last named period. But it is almost equally impossible that it can belong to the first. The point of view of this period on the question of evil is that represented by Job's friends, a point of view from which our book signalizes a final departure. On the other hand, the spirit of Job is that which breathes in the psalms referred to and in many other fragments of the Scriptures of the prophetic age. Such problems as burn in the pages of Job—the miseries of the just, and the felicity of the ungodly—were not likely to force themselves on men's attention in the Solomonic age. In the settled, well-ordered life of Israel in this happy time, the general principles of moral well-being were receiving their most splendid illustration. Only later, when the state began to receive fatal blows from without, and when through revolution and civil discord at home great and unmerited sufferings befell the best citizens in the state, would such problems rise with an urgency that demanded some solution. In some of the psalms which treat of these questions, the "ungodly" oppressor, whose felicity occasions disquietude to the religious mind, is probably the heathen conqueror. But these shorter pieces in all likelihood preceded in time the elaborate treatment to which such problems are subjected in Job. It is doubtful if there is a trace of such questions in Proverbs, which, however, did not receive its final form till the age of Hezekiah. In one direction the Wisdom receives a higher development in Prov. viii. than it does in Job, but that despair of the attainment by man of any theoretical wisdom at all, which is the burden of Job xxviii., is unheard of even in Prov. i-ix., which certainly dates from a time long posterior to the Solomonic age. The book of Job probably has behind it some public calamity which forced the question of evil on men's minds with an urgency that could not be resisted. Such a calamity, wide and national, could be nothing less than the dismemberment or subjugation of the state. The question may be difficult to settle whether it was a misfortune befalling the northern kingdom or that of the south. We gain no help here from the book itself, for the author of Job is an Israelite indeed, who belongs to none of its divisions. Somewhere in the troubled period between the early part of the 7th and the early part of the 5th century the poem may have been written. Ewald and many distinguished writers on the book support the earlier date, while on the part of living scholars there is rather a growing feeling that the book is later than some of the prophecies of Jeremiah.

This question has to be settled largely by a comparison of literary coincidences and allusions. This is a very delicate operation. For, first, owing to the unity of thought and language which pervades Scripture, in which, regarding it for a moment merely as a national literature, it differs from all other national literatures, we are apt to be deceived, and to take mere similarities for literary allusions and quotations; and, secondly, even when we are sure that there is dependence, it is often uncommonly difficult to decide which is the original source. The reference to Job in Ezek. xiv. 14 may not be to our book, but to the man who was afterwards made the hero of it. The affinities between Job and Isa. xl.–lxvi. are very close. The date of this part of Isaiah is uncertain, but it cannot have received its final form, if it be composite, long before the return. Its affinity with Job is not only literary; the problem is the same, the meaning of the afflictions of the "servant" of the Lord. "My servant Job" may not be the same as "my righteous servant" of Isaiah, but there is no doubt national allusion in Job. The solution of the problem differs in the two. In Job sufferings are a trial of faith, which, successfully borne, issues in restoration. In Isaiah they are vicarious, borne by one element in the nation in behalf of the whole, and issuing in the national redemption. Two such solutions can scarcely be entirely contemporaneous. That of Isaiah is the profounder truth and may be the later, though certainty on such a point is of less consequence than the reflection both solutions force upon us that this is the period in Israel's history at which the profoundest depths of religious thought were sounded. Between Job iii. and Jer. xx. 14 *sq.* there is certainly literary connection. The judgment of different minds differs on the question which passage is dependent on the other. The language of Jeremiah has a natural pathos and genuineness of feeling in it, somewhat in contrast with the elaborate poetical finish of Job's words, which might suggest the originality of the former; and there is a growing feeling among many in favor of this view. At the same time a good deal remains yet to be said on both sides.

The book of Job is not literal history, though it reposes on an historical tradition. To this tradition belong probably the name of Job and his country, and the names of his three friends, and perhaps also many other details impossible to specify particularly. The view that the book is entirely a literary creation with no basis in historical tradition is as old as the Talmud, in which a rabbi is cited who says, Job was not, and was not created, but is an allegory. And this view has still supporters, *e. g.*, Hengstenberg. Pure poetical creations on so extensive a scale are not probable in the East and at so early an age.

Author.—The author of the book is wholly unknown. No literature has so many great anonymous works as that of Israel. The religious life of this people was at certain periods very intense, and at those times the spiritual energy of the nation expressed itself almost impersonally, through men who forgot themselves and were speedily forgotten in name by others. Hitzig conjectures that the author was a native of the north on account of the free criticism of providence which he allows himself. Others, on account of some affinities with the prophet Amos, infer that he belonged to the south of Judah, and this is supposed to account for his intimate acquaintance with the desert. Ewald considers that he belonged to the exile in Egypt, on account of his minute acquaintance with that country. But all these conjectures localize an author whose knowledge was not confined to any locality, who was a true child of the East and familiar with life and nature in every country there, who was at the same time a true Israelite, and felt that the earth was the Lord's and the fulness thereof, and whose sympathies and thought took in all God's works.

Literature.—The literature of the book will be found fully given in Delitzsch's commentary, or in Lange's *Bibelwerk.* A few more recent essays may be mentioned bearing on the criticism and the problem of the book: Hoekstra, "Job, de Knecht van Jehovah," in the *Theolog. Tijds.*, 1871, and in reply, Kuenen, "Job en de leidende Knecht van Jahveh," *ibid.*, 1873; Studer, "Ueber die Integrität des Buches Hiob," in the *Jahrb. für Prot. Theologie*, 1875, and *Das Buch Hiob für gebildete Laien*, Bremen, 1881; Budde, *Beiträge zur Kritik des B. Hiob*, Bonn, 1876, with the review of Smend, *Stud. u. Krit.*, 1878; Cheyne, "Job and the second part of Isaiah," *Isaiah.* ii. p. 235 *sq.* (A. B. D.)

JOB'S TEARS. The seeds, or properly fruits of Job's tears, *Coix lachryma*, Willd., a species of grass, are contained singly in a stony involucre or bract, which does not open until the enclosed seed germinates. The young involucre surrounds the female flower and the stalk supporting the spike of male flowers, and when ripe has the appearance of bluish-white porcelain. Being shaped somewhat like a large drop of fluid, the form has suggested the name of Job's tears, or *Lachryma Jobi*, under which the plant has been long known. The seeds are esculent, but the involucres are the part chiefly used for making necklaces and other ornaments. The plant is a native of the East Indies, and was cultivated by Gerard as a tender annual.

JODHPUR, also called MÁRWÁR, a native state in Rájputána, India, situated between 24° 36′ and 27° 42′ N. lat., and between 70° 6′ and 75° 24′ E. long. It is bounded on the N. by Bíkaner and Jeypore states, on the E. by Jeypore and Kishangarh, on the S. by Sirohi and Pálanpur states, and on the W. by the Rann of Kachchh (Runn of Cutch) and the British district of Thar and Párkar in Sind. The general aspect of the country is that of a sandy plain, divided into two unequal parts by the river Lúni, and dotted with bold and picturesque conical hills, attaining in places an elevation rising to 3000 feet. The river Lúni is the principal feature in the physical aspects of Jodhpur. It takes its rise in the sacred lake of Pushkar in Ajmere, and flows through Jodhpur in a southwesterly direction till it is finally lost in the marshy ground at the head of the Runn of Cutch. It is fed by numerous tributaries and occasionally overflows its banks, fine crops of wheat and barley being grown on the saturated soil. Its water is, as a rule, saline or brackish, but comparatively sweet water is obtained from wells sunk at a distance of 20 or 30 yards from the river bank. The famous salt-lake of Sambhar is situated on the borders of Jodhpur and Jeypore, and two smaller lakes of the same description lie within the limits of the district, from which large quantities of salt are annually extracted. Zinc is also obtained in considerable quantities, and marble is mined in the north of the state, and along the southeast border.

The population consists of Rahtor Rájputs (who form the ruling class), Charans, Bháts, Játs, Bishnawis, Minas, Bhíls, and Baurís, with a small proportion of Mahometans. The Charans, a sacred race, hold large religious grants of land, and enjoy peculiar immunities as traders in local produce. The Bháts are by profession genealogists, but also engage in trade. The Minas, Baurís, and Bhíls are predatory classes, but are employed in menial capacities. The Mahometans are principally soldiers. The natives, as a race, are enterprising and industrious, but the agricultural classes have to undergo great privations from poor food, and often bad water. Márwári traders are to be found throughout the length and breadth of the peninsula. No census of the population has ever been taken, but it has roughly been estimated at about 2,850,000, of whom 86 per cent. are said to be Hindus, 10 per cent. Jains, and 4 per cent, Mahometans.

The principal crops are pulses and millets, but wheat and barley are largely produced in the fertle tract watered by the Lúni river. The manufactures comprise leather boxes and brass utensils; and turbans and scarfs and a description of embroidered silk knotted thread are specialties of the country. A large proportion of the population can read and write Hindí, including most ladies of good birth, which is believed to be peculiar to this state. Jodhpur town contains two good schools, one for the sons of chiefs and the higher classes, and the other for the children of tradespeople downwards. Every large village also has a school of its own, in which the vernacular is taught.

The máharájá belongs to the Rahtor clan of Rájputs. The local historians relate that after the downfall of the Rahtor dynasty of Kanauj in 1194 at Sivají, the grandson of Jái Chánd, the last king of Kanauj, entered Márwár on a pilgrimage to Dwarka, and on halting at the town of Páli he and his followers settled there to protect the Bráhman community from the constant raids of marauding bands. The Rahtor chief thus laid the foundation of the state, but it was not till the time of Ráo Chánda, the tenth in succession from Sivají, that Márwár was actually conquered. His grandson Jodha founded the city of Jodhpur, which he made his capital. In 1561 the country was invaded by Akbar, and the chief was forced to submit, and to send his son as a mark of homage to take service under the Mughal emperor. When this son Udái Sinh succeeded to the chiefship, he gave his sister Jodhbái in marriage to Akbar, and was rewarded by the restoration of most of his former possessions. Udái Sinh's son, Rájá Geve Sinh, held high service under Akbar, and conducted successful expeditions in Guzerat and the Deccan. The bigoted and intolerant Aurangzeb invaded Márwár in 1679, plundered Jodhpur, sacked all the large towns, and commanded the conversion of the Rahtors to Mahometanism. This cemented all the Rájput clans into a bond of union, and a triple alliance was formed by the three states of Jodhpur, Udáipur, and Jeypore, to throw off the Mahometan yoke. One of the conditions of this alliance was that the chiefs of Jodhpur and Jeypore should regain the privilege of marriage with the Udáipur family, which they had forfeited by contracting alliances with the Mughal emperors, on the understanding that the offspring of Udáipur princesses should succeed to the state in preference to all other children. The quarrels arising from this stipulation lasted through many generations, and led to the invitation of Marhattá help from the rival aspirants to power, and finally to the subjection of all the Rájput states to the Marhattás. Jodhpur was conquered by Sindhia, who levied from it a tribute of £60,000, and took from it the fort and town of Ajmere. Internecine disputes and succession wars disturbed the peace of the early years of the century, until in January, 1818, Jodhpur was taken under British protection. In 1839 the misgovernment of the rájá led to an insurrection which compelled the interference of the British, and Jodhpur was held in military occupation for five months, until the rájá entered into engagements for the future good government of his subjects. In 1843, the chief having died without a son, and without having adopted an heir, the nobles and state officials were left to select a successor from the nearest of kin. Their choice fell upon Rájá Takht Sinh, chief of Ahmadnagar. This chief, who did good service during the mutiny, died in 1873. The constitution of Jodhpur may be described as a tribal suzerainty, rapidly passing into the feudal stage. The *pattait* or tribal chief is the ruler of his estate, and the judge almost exclusively in all matters of civil and criminal jurisdiction over his people. These chiefs owe military service to their suzerain, and exact the same from their dependants, to whom assignments of land have been made, and who form their following—the whole constituting the following of the suzerain himself. The máharájá alone has the power of life and death. The revenue of the state is mainly derived from the land, salt, and customs duties, a cess imposed on the feudatory nobles, succession dues, etc., estimated at a total of about £250,000 a year. The state pays a tribute to the British of £9800 a year, besides an annual payment of £11,500 for the support of a contingent—the Erinpura Irregular Force. The máharájá also maintains an independent military force of 20 field and 250 other guns, 200 gunners, 3545 cavalry, and 5020 infantry.

JODHPUR, the capital of the above state, in 26° 17′ N. lat. and 73° 4′ E. long., was built by Ráo Jodha in 1549, and from that time has been the seat of government of the principality. It is surrounded by a strong wall nearly 6 miles in extent, with seventy gates. The fort stands on an isolated rock, and contains the mahárájá's palace, a large and handsome building, completely covering the crest of the hill on which it stands, and overlooking the city, which lies several hundred feet below. The city contains many handsome buildings—palaces of the máharájá, and town residences of the *thákurs* or nobles, besides numerous fine temples and tanks. Building stone is plentiful, and close at hand, and the architecture solid and handsome. Three miles north from Jodhpur are the ruins of Mandor, the site of the ancient capital of the Purihar princes of Márwár, prior to its conquest by the Rahtors.

JOEL. The second book among the minor prophets is entitled *The word of Jehovah that came to Joel the son of Pethuel*, or, as the Septuagint, Latin, Syriac, and other versions read, *Bethuel*. Nothing is recorded as to the date or occasion of the prophecy, which presents several peculiarities that aggravate the difficulty always felt in interpreting an ancient book when the historical situation of the author is obscure. Most Hebrew prophecies contain pointed references to the foreign politics and social relations of the nation at the time. In the book of Joel there are only scanty allusions to Phœnicians, Philistines, Egypt, and Edom, couched in terms applicable to very different ages, while the prophet's own people are exhorted to repentance without specific reference to any of those national sins of which other prophets speak. The occasion of the prophecy, described with great force of rhetoric, is no known historical event, but a plague of locusts, perhaps repeated in successive seasons; and even here there are features in the description which have led many expositors to seek an allegorical interpretation. The most remarkable part of the book is the eschatological picture with which it closes; and the way in which the plague of locusts appears to be taken as foreshadowing the final judgment—the great day or assize of Jehovah, in which Israel's enemies are destroyed—is so unique as greatly to complicate the exegetical problem. It is not therefore surprising that the most various views are still held as to the date and meaning of the book. Allegorists and literalists still contend over the first and still more over the second chapter, and, while the largest number of recent interpreters accept Credner's view that the prophecy was written in the reign of Joash of Judah, a rising and powerful school of critics follow the view suggested by Vatke (*Bib. Theol.*, p. 462 *sq.*), and reckon Joel among the post-exile prophets. Other scholars give yet other dates: see the particulars in the elaborate work of Merx, *Die Prophetie des Joels und ihre Ausleger*, Halle, 1879. The followers of Credner are literalists; the opposite school of moderns includes some literalists (as Duhm), while others (like Hilgenfeld, and in a modified sense Merx) adopt the old allegorical interpretation which treats the locusts as a figure for the enemies of Jerusalem.

The reasons for placing Joel either earlier or later than the great series of prophets extending from the time when Amos first proclaimed the approach of the Assyrian down to the Babylonian exile are cogent. In Joel the enemies of Israel are the nations collectively, and among those specified by name neither Assyria nor Chaldæa finds a place. This circumstance might, if it stood alone, be explained by placing Joel with Zephaniah in the brief interval between the decline of the empire of Nineveh and the advance of the Babylonians. But it is further obvious that Joel has no part in the internal struggle between spiritual Jehovah-worship and idolatry which occupied all the prophets from Amos to the captivity. He presupposes a nation of Jehovah-worshippers, whose religion has its centre in the temple and priesthood of Zion, which is indeed conscious of sin, and needs forgiveness and an outpouring of the Spirit, but is not visibly divided, as the kingdom of Judah was, between the adherents of spiritual prophecy and a party whose national worship of Jehovah involved for them no fundamental separation from the surrounding nations. The book, therefore, must have been written before the ethico-spiritual and the popular conceptions of Jehovah came into conscious antagonism, or else after the fall of the state and the restoration of the community of Jerusalem to religious rather than political existence had decided the contest in favor of the prophets, and of the Law in which their teaching was ultimately crystallized.

The considerations which have given currency to an early date for Joel are of various kinds. The absence of all mention of one great oppressing world-power seems most natural before the westward march of Assyria involved Israel in the general politics of Asia. The purity of the style is also urged, and a comparison of Amos i. 2, Joel iii. 16 (Heb. iv. 16), and Amos ix. 13, Joel iii. 18 (iv. 18), has been taken as proving that Amos knew our book. The last argument might be inverted with much greater probability, and numerous points of contact between Joel and other parts of the Old Testament (*e.g.*, Joel ii. 2, Exod. x. 14; Joel ii. 3, Ezek. xxxvi. 35; Joel iii. 10, Mic. iv. 3) make it not incredible that the purity of his style—which is rather elegant than original and strongly marked—is in large measure the fruit of literary culture. The absence of allusion to a hostile or oppressing empire may be fairly taken in connection with the fact that the prophecy gives no indication of political life at Jerusalem. When the whole people is mustered in chap. i. the elders or sheikhs of the municipality and the priests of the temple are the most prominent figures. The king is not mentioned,—which on Credner's view is explained by assuming that the plague fell in the minority of Joash, when the priest Jehoiada held the reins of power,—and the princes, councillors, and warriors necessary to an independent state, and so often referred to by the prophets before the exile, are altogether lacking. The nation has only a municipal organization with a priestly aristocracy, precisely the state of things that prevailed under the Persian empire. That the Persians do not appear as enemies of Jehovah and His people is perfectly natural. They were hard masters but not invaders, and under them the enemies of the Jews were their neighbors, just as appears in Joel.[1] Those, however, who place our prophet in the minority of King Joash draw a special argument from the mention of Phœnicians, Philistines, and Edomites (iii. 4 *sq.*, 19), pointing to the revolt of Edom under Joram (2 Kings viii. 20) and the incursion of the Philistines in the same reign (2 Chron. xxi. 16, xxii. 1). These were recent events in the time of Joash, and in like manner the Phœnician slave trade in Jewish children is carried back to an early date by the reference in Amos i. 9. This argument is rather specious than sound. Edom's hostility to Judah was incessant, but the feud reached its full intensity only after the time of Deuteronomy (xxiii. 7), when the Edomites joined the Chaldæans, drew profit from the overthrow of the Jews, whose land they partly occupied, and exercised barbarous cruelty towards the fugitives of Jerusalem (Obad. *passim;* Mal. i. 2 *sq.;* Isa. lxiii.). The offence of shedding innocent blood charged on them by Joel is natural after these events, but hardly so in connection with the revolt against Joram.

As regards the Philistines, it is impossible to lay much weight on the statement of Chronicles, unsupported as it is by the older history, and in Joel the Philistines plainly stand in one category with the Phœnicians, as slave dealers, not as armed foes. Gaza in fact was a slave emporium as early as the time of Amos (i. 6), and continued so till Roman times.

Thus, if any inference as to date can be drawn from chap. iii., it must rest on special features of the trade in slaves, which was always an important part of the commerce of the Levant. In the time of Amos the slaves collected by Philistines and Tyrians were sold *en masse* to Edom, and presumably went to Egypt or Arabia. Joel complains that they were sold to the Grecians (Javan, Ionians).[2] It is probable that some Hebrew and Syrian slaves were exported to the Mediterranean coasts from a very early date, and Isa. xi. 11 already speaks of Israelites captive in these districts as well as in Egypt, Ethiopia, and the East. But the traffic in this direction hardly became extensive till a later date. In Deut. xxviii. 68 Egypt is still the chief goal of the maritime slave trade, and in Ezek. xxvii. 13 Javan exports slaves to Tyre, not conversely. Thus the allusion to Javan in Joel better suits a later date, when Syrian slaves were in special request in Greece.[3] And the name of Javan is not found in any part of the Old Testament certainly older than Ezekiel. In Joel it seems to stand as a general representative of the distant countries reached by the Mediterranean (in contrast with the southern Arabians, *Sabæans*, chap. iii. 8), the furthest nation reached by the fleets of the Red Sea. This is precisely the geographical standpoint of the post-exile author of Gen. x. 4, where Javan includes Carthage and Tartessus.

Finally, the allusion to Egypt in Joel iii. 19 must on Credner's theory he explained of the invasion of Shishak a century before Joash. From this time down to the last period of the Hebrew monarchy Egypt was not the enemy of Judah.

If the arguments chiefly relied on for an early date are so precarious or can even be turned against their inventors, there are others of an ambiguous kind which make for a date in the Persian period. It appears from chap. iii, 1, 2 that Joel wrote after the exile. The phrase "to bring again the captivity" would not alone suffice to prove this, for it is used in a wide sense, and perhaps means rather to "reverse the calamity;"[4] but the dispersion of Israel among the nations, and the allotment of the Holy Land to new occupants, cannot fairly be referred to any calamity less than that of the captivity. With this the whole standpoint of the prophecy agrees. To Joel Judah and the people of Jehovah are synonyms; northern Israel has disappeared. Now it is true that those who take their view of the history from Chronicles, where the kingdom of Ephraim is always treated as a sect outside the true religion, can reconcile this fact with an early date. But in ancient times it was not so; and under Joash, the contemporary of Elisha, such a limitation of the people of Jehovah is wholly inconceivable. The earliest prophetic books have a quite different standpoint; otherwise indeed the books of northern prophets and historians could never have been admitted into the Jewish canon. Again, the significant fact that there is no mention of a king and princes, but only of sheikhs and priests, has a force not to be invalidated by the ingenious reference of the book to the time of Joash's minority and the supposed regency of Jehoiada.[5] And the assumption that there was a period before the prophetic conflicts of the 8th century when spiritual prophecy had unchallenged sway, when there was no gross idolatry or superstition, when the priests of Jerusalem, acting in accord with prophets like Joel, held the same place as heads of a pure worship which they occupied after the exile (comp. Ewald, *Propheten*, i. 89), is not consistent with history. It rests on the old theory of the antiquity of the Levitical legislation, so that in fact all who place that legislation later than Ezekiel are agreed that the book of Joel is also late. In this connection one point deserves special notice. The religious significance of the plague of drought and locusts is expressed in chap. i. 9 in the observation that the daily meat and drink offering are cut off, and the token of new blessing is the restoration of this service, chap. ii. 14. In other words, the daily offering is the continual symbol of gracious intercourse between Jehovah and His people and the main office of religion. This conception, which finds its parallel in Dan. viii. 11, xi. 31, xii. 11, is quite in accordance with the later law. But under the monarchy the daily oblation was the king's private offering, and not till Ezra's reformation did it become the affair of the community and the central act of national worship (Neh. x. 33 *sq.*).[6] That Joel wrote not only after the exile but after the work of Ezra and Nehemiah may be viewed as confirmed by the allusions to the walls of Jerusalem in chap. ii. 7, 9. Such is the historical basis which we seem to be able to lay for the study of the exegetical problems of the book.

The style of Joel is clear, and his language presents little difficulty beyond the occurrence of several unique words, which in part may very well be due to errors of the text. But the structure of the book, the symbolism, and the connection of the prophet's thoughts have given rise to much controversy. It seems safest to start from the fact that the prophecy is divided into two well-marked sections by chap. ii. 18, 19a. According to the Massoretic vocalization, which is in harmony with the most ancient exegetical tradition as contained in the LXX., these words are historical: "Then the Lord was jealous, . . . and answered and said unto his people, Behold." etc. Such is the natural meaning of the words as pointed, and the proposal of Merx to change the pointing so as to transform the perfects into futures, and make the priests pray that Jehovah will answer and deliver the gracious promises that fill the rest of the book, is an exegetical monstrosity not likely to find adherents.

---

[1] On the Authorized Version of ii. 17 it appears that subjection to a foreign power is not a present fact but a thing feared. But the parallelism and ver. 19 justify the now prevalent rendering, "that the heathen should make a mock of them."

[2] The hypothesis of an Arabian Javan, applied to Joel iii. 6 by Credner, Hitzig, and others, may be viewed as exploded. See Stade, *De Populo Javan*, Giessen Programme, 1880.

[5] Stade not unreasonably questions whether 2 Kings xii. 1–3 implies the paramount political influence of Jehoiada. *Op. cit.*, p. 17.

[6] See Wellhausen, *Geschichte Israels*, p. 78 *sq.*

Thus the book falls into two parts. In the first the prophet speaks in his own name, addressing himself to the people in a lively description of a present calamity caused by a terrible plague of locusts, which threatens the entire destruction of the country, and appears to be the vehicle of a final consuming judgment (the day of Jehovah). There is no hope save in repentance and prayer; and in chap. ii. 12 the prophet, speaking now for the first time in Jehovah's name, calls the people to a solemn fast at the sanctuary, and invites the intercession of the priests. The calamity is described in the strongest colors of Hebrew hyperbole, and it seems arbitrary to seek too literal an interpretation of details, *e. g.*, to lay weight on the four names of locusts, or to take chap. i. 20 of a conflagration produced by drought, when it appears from ii. 3 that the ravages of the locusts themselves are compared to those of fire. But when due allowance is made for Eastern rhetoric, there is no occasion to seek in this section anything else than literal locusts. Nay, the allegorical interpretation, which takes the locusts to be hostile invaders, breaks through the laws of all reasonable writing; for the poetical hyperbole which compares the invading swarms to an army (ii. 4 *sq.*) would be inconceivably lame if a literal army was already concealed under the figure of the locusts. Nor could the prophet so far forget himself in his allegory as to speak of a victorious host as entering the conquered city like a thief (ii. 9). The second part of the book is Jehovah's answer to the people's prayer. The answer begins with a promise of deliverance from famine, and of fruitful seasons compensating for the ravages of the locusts. In the new prosperity of the land the union of Jehovah and His people shall be sealed anew, and so the Lord will proceed to pour down further and higher blessings. The aspiration of Moses (Num. xi. 29) and the hope of earlier prophets (Isa. xxxii. 15, lix. 21; comp. Jer. xxxi. 33) shall be fully realized in the outpouring of the Spirit on all the Jews and even upon their servants (compare Isa. lxi. 5 with lvi. 6, 7); and then the great day of judgment, which had seemed to overshadow Jerusalem in the now averted plague, shall draw near with awful tokens of blood and fire and darkness. But the terrors of that day are not for the Jews but for their enemies. The worshippers of Jehovah on Zion shall be delivered (comp. Obad. ver. 17, whose words Joel expressly quotes in chap. ii. 32), and it is their heathen enemies, assembled before Jerusalem to war against Jehovah, who shall be mowed down in the valley of Jehoshaphat (*Jehovah judgeth*) by no human arm but by heavenly warriors. Thus definitively freed from the profane foot of the stranger (comp. Isa. iii. 1), Jerusalem shall abide a holy city for ever. The fertility of the land shall be such as was long ago predicted in Amos ix. 13, and streams issuing from the temple, as Ezekiel had described in his picture of the restored Jerusalem (Ezek. xlvii.), shall fertilize the barren Wâdy of Acacias. Egypt and Edom, on the other hand, shall be desolate, because they have shed the blood of Jehovah's innocents. Compare the similar predictions against Edom, Isa. xxxiv. 9 *sq.* (Mal. i. 3), and against Egypt, Isa. xix. 5 *sq.*, Ezek. xxix. Joel's eschatological picture appears indeed to be largely a combination of elements from older unfulfilled prophecies. Its central feature, the assembling of the nations to judgment, is already found in Zeph. iii. 8, and in Ezekiel's prophecy concerning Gog and Magog, where the wonders of fire and blood named in Joel ii. 30 are also mentioned (Ez. xxxviii. 22). The other physical features of the great day, the darkening of the lights of heaven, are a standing figure of the prophets from Amos v. 6, viii. 9, downwards. It is characteristic of the prophetic eschatology that images suggested by one prophet are adopted by his successors, and gradually become part of the permanent scenery of the last times; and it is a proof of the late date of Joel that almost his whole picture is made up of such features. In this respect there is a close parallelism, extending to minor details, between Joel and the last chapters of Zechariah.

That Joel's delineation of the final deliverance and glory attaches itself directly to the deliverance of the nation from a present calamity is quite in the manner of the so-called prophetic perspective. But the fact that the calamity which bulks so largely is natural and not political is characteristic of the post-exile period. Other prophets of the same age speak much of dearth and failure of crops, which in Palestine, then as now, were aggravated by bad government, and were far more serious to a small and isolated community than they could ever have been to the old kingdom. It was indeed by no means impossible that Jerusalem might have been altogether undone by the famine caused by the locusts; and so the conception of these visitants as the destroying army, executing Jehovah's final judgment, is really much more natural than appears to us at first sight, and does not need to be explained away by allegory. The chief argument relied upon by those who still find allegory at least in chap. ii. is the expression הצפני, "the Northener," in ii. 20. In view of the other points of affinity between Joel and Ezekiel, this word inevitably suggests Gog and Magog, and it is difficult to see how a swarm of locusts could receive such a name, or if they came from the north could perish, as the verse puts it, in the desert between the Mediterranean and the Dead Sea. The verse remains a *crux interpretum*, and no exegesis hitherto given can be deemed thoroughly satisfactory; but the interpretation of the whole book must not be made to hinge on a single word in a verse which might be altogether removed without affecting the general course of the prophet's argument.

The whole verse is perhaps the addition of an allegorizing glossator. The prediction in ver. 19, that the seasons shall henceforth be fruitful, is given after Jehovah has shown His zeal and pity for Israel, not of course by mere words, but by acts, as appears in verses 20, 21, where the verbs are properly perfects recording that Jehovah hath already done great things, and that vegetation has already revived. In other words, the mercy already experienced in the removal of the plague is taken as a pledge of future grace not to stop short till all God's old promises are fulfilled. In this context ver. 20 is out of place. Observe also that in ver. 25 the locusts are spoken of in the plain language of chap. i.

For the literature on Joel in common with the other minor prophets, see HOSEA. There are separate commentaries by Credner (Halle, 1831), Wünsche (Leips., 1872), Merx (Halle, 1879). The last-named gives an elaborate history of interpretation from the Septuagint down to Calvin, and appends the Ethiopic text edited by Dillmann. Of older commentaries the most valuable is Pococke's (Oxford, 1691). Bochart's *Hierozoicon* may also be consulted. (W. R. S.)

JOHN, the Apostle (יוֹחָנָן, "Jehovah hath been gracious"), was the son of Zebedee, a Galilæan fisherman, and Solome. It is probable that he was born at Bethsaida, where along with his brother James he followed his father's occupation. The family appear to have been in easy circumstances; at least we find that Zebebee employed hired servants, and that Salome was among the number of those women who contributed to the maintainance of Jesus; he himself was perhaps related to Annas the high priest (John xviii. 15, 16). It seems to have been when attending as a disciple the preaching of John the Baptist at Bethany beyond Jordan that he first became personally acquainted with our Lord (John i. 35 *sq.*); his "call" to follow Him occurred simultaneously with that addressed to his brother and to Andrew and Peter (Mark i. 19, 20). He speedily took his place among the twelve apostles, sharing with James the title of Boanerges ("sons of thunder"), became a member of that inner circle to which, in addition to his brother, Peter alone belonged, and ultimately was recognized as the disciple *par excellence* whom Jesus loved, a distinction usually attributed to his amiability and gentleness of character, but much less probably due to any special sweetness of temperament (see Luke ix. 54; Mark iii. 17, ix. 38) than to a quickness and depth of insight which enabled him to enter more fully than his companions into the larger and wider-reaching views of his Master. After the departure of Jesus John remained at Jerusalem, where he was one of the most prominent among those who bore personal testimony to the fact of the resurrection; we find him for a short time in Samaria (Acts viii. 14, 25) after the martyrdom of Stephen, but on Paul's second visit to the Jewish capital (Gal. ii. 9) John was again there. His subsequent movements are obscure, but he can hardly have been in Jerusalem at the time of Paul's last visit there in 58 A. D.

At this point the history of the apostle is taken up by ecclesiastical tradition. Polycrates, bishop of Ephesus, 196 A.D. (in Euseb., *H. E.*, iii. 31; v. 24), attests that John "who lay on the bosom of the Lord" died at Ephesus; and, though this evidence is weakened by the legendary trait that he "was a priest wearing the πέταλον" or gold plate that distinguished the high-priestly mitre, it is fair to infer that the grave of the apostle was already shown (comp. *H. E.*, iii. 39). Irenæus in various passages of his works confirms this tradition. He says that John lived up to the time of Trajan, and published his Gospels in Ephesus. Irenæus also identifies the apostle with John the disciple of the Lord, who wrote the Apocalypse under Domitian, whom his teacher Polycarp had known personally, and of whom Polycarp had much to tell. These traditions are accepted and enlarged by later authors, Tertullian adding that John was banished to Patmos after he had miraculously survived the punishment of immersion in boiling oil. As it is evident that legend was busy with John as early as the time of Polycrates, while Irenæus's view that the Apocalypse was written under Domitian is inconsistent with the internal evidence offered by that book, the real worth of these traditions requires to be tested by examination of their ultimate source. This inquiry has been pressed upon scholars since the apostolic authorship of the Apocalypse or of the Fourth Gospel or of both these works has been disputed. See Gospels and Revelation. The question is not strictly one between advanced and conservative criticism, for the Tübingen school recognized the Apocalypse as apostolic, and found in it a confirmation of John's residence in Ephesus. On the other hand, Lützelberger (1840), Keim (*Jesu v. Naz.*, vol. i. 1867), Holtzmann (in *Bibel-Lex.*, *s.v.*), Scholten (*Theol. Tijdsch.*, 1871), and other recent writers wholly reject the tradition, while it has able defenders in Steitz (*Stud. u. Krit.*, 1868), Hilgenfeld (*Einl.*, 1875, p. 394 *sq.*; *Z. f. W. T.* 1872, 1877), and Lightfoot (*Contemp. Rev.*, 1875, 1876).

The opponents of the tradition lay weight on the absence of positive evidence before the latter part of the 2d century, especially in Papias, and in the epistles of Ignatius and of Irenæus's authority Polycarp. But they also find it necessary to assume that Irenæus mistook Polycarp, and that John, "the disciple of the Lord," who was known to the latter, was not the apostle but a certain presbyter John of whom we hear from Papias. This view would be at once refuted if we could hold with some scholars that the presbyter is but another name for the apostle. This identification had already supporters in the time of Jerome (*Vir. Ill.*, 9; comp. Usener, *Acta S. Timothei*, Bonn, 1877), but seems inconsistent with a fair reading of the words of Papias. It is therefore very possible that some things which Irenæus in his later years supposed Polycarp to have related of the apostle really belong to the other John (see Gospels, x. 820); but it is a much stronger thing to assume that he was mistaken in supposing that Polycarp had conversed with the apostle at all. An altogether independent and apparently inconsistent tradition that John was killed by the Jews is given on the authority of Papias by Georgius Hamartolus in the 9th century.

JOHN, Epistles of. Of the three Epistles which are ascribed to the apostle John, the First is by far the most important, both from the space which it occupies in the canon and from the weightiness of its teaching.

First Epistle.—*Title.*—Some exception has been taken to the title "epistle" as applied to this document, seeing that it bears the name neither of sender nor of recipient, and carries with it no definiteness of message to a special correspondent. But, though it may be admitted that with regard to its literary form it would more properly be described as a homily or discourse, the frequently recurring terms "I wrote," "I have written," imply that the message was written, not orally delivered.

Genuineness.—The external evidence for the genuineness of this epistle is weighty. Polycarp, a disciple of John, writes with evident reference to 1 John iv. 3; *πᾶς γὰρ ὃς ἂν μὴ ὁμολογῇ Ἰησοῦν Χριστὸν ἐν σαρκὶ ἐληλυθέναι ἀντιχριστός ἐστιν* (*Ad Phil.*, vii.). Eusebius, writing of Papias (*H. E.*, iii. 39), says: *Κέχρηται δ' ὁ αὐτὸς μαρτυρίαις ἀπὸ τῆς Ἰωάννου προτέρας ἐπιστολῆς καὶ ἀπὸ τῆς Πέτρου ὁμοίως.*[1] The epistle was frequently cited by Irenæus, a disciple of Polycarp, as we learn both from the statement of Eusebius (*H. E.*, v. 8) and from his extant work against heretics (*Adv. Hæret.*, iii. 16, v. and viii.). The two epistles of St. John mentioned in the canon of Muratori are probably the Second and Third, but the absence of reference to the First in that particular connection implies its acknowledged canonicity; moreover, the same canon contains a citation of 1 John i. 1, 4. The early fragment called the letter to Diognetus has unmistakable allusions to the Johannine epistles. The Peshito contains the epistle, and there is an undoubted reference to it in the letter from the churches of Vienne and Lyons. All those authorities belong to the first two centuries. In the succeeding centuries the volume of evidence grows. Eusebius reckons the epistle among the *Homologoumena* or writings of acknowledged authority, and the testimony of Tertullian, Clemens Alexandrinus, Origen, and Cyprian, in addition to the evidence already adduced, indicates its reception in all the churches.[2]

To those who accept the Fourth Gospel as John's, the strength of the internal evidence for the Johannine authorship of the epistle lies in the similarity of words, of teaching, and of style between the two writings. This similarity is so marked that it requires no argumentative proof. It is a similarity not only of diction, or of parallel expressions and peculiarities of style, but one which is penetrated by the more subtle correspondence of under-currents of thought and of implied knowledge. See on this part of the subject Westcott, *Introduction to the Gospel of St. John*, p. lxi. *sq.*, in the *Speaker's Commentary;* and Davidson's *Introduction to the Study of the New Testament*, ii. 293 *sq.* On the other hand, the very closeness of the connection between the epistles and the gospel has necessarily involved the former in the assaults of recent criticism upon the genuineness of the latter.[3] Some critics, however, while admitting the similarity of style, contend that there are differences of doctrine between the gospel and epistle which preclude identity of authorship. The main points advanced in behalf of this statement are—the supposed differences in eschatological views, the application of the term "Paraclete" to the work of the Holy Spirit in the Gospel and to the office of Christ alone in the epistle, the introduction into the epistle of such terms as *ἱλασμός* and *χρίσμα*, which are not found in the gospel, and, lastly, the polemical and strongly anti-Docetic tone which is said to distinguish the epistle from the gospel. Such differences, however, are in part more apparent than real

---

[1] See, however, for exceptions that may be taken to these testimonies, Gospels, vol. x. pp. 820, 822.

[2] The epistle was not included in the Marcionite canon, and the *Alogi*, an obscure sect so named by Epiphanius (*Hær.*, i. 1–3), seem to have rejected this, together with the other writings of St. John.

[3] See Gospels, vol. x. p. 828.

(they are certainly not contradictions), and in part may be naturally explained by the changed circumstances in which the two writings were composed and the different aims proposed in them. On this point see Westcott, p. lxxxviii., and Reuss, *Introduction*, p. 358, *sq.*

Date.—The date of the epistle must remain in uncertainty; but it is generally viewed as later in composition than the gospel. "The phrases in the gospel," writes Professor Westcott, "have a definite historical connection; they belong to circumstances which explain them. The phrases in the epistle are in part generalizations and in part interpretations of the earlier language in view of Christ's completed work, and of the experience of the Christian church." The same writer assigns on good grounds to the gospel as well as to the epistle a date subsequent to the fall of Jerusalem. In this view ἐσχάτη ὥρα, ch. ii. 18, must be understood of the approach of the second advent of Christ.

Occasion and Contents.—Mr. Browning has in his *Death in the Desert* caught the true occasion of the apostle's letter: it was written in view of the time when

> "There is left on earth
> No one alive who knew (consider this),—
> Saw with his eyes and handled with his hands
> That which was from the first, the Word of Life;
> How will it be when none more saith 'I saw?'"

It is the testimony of the last surviving eyewitness of the Lord, far removed from the scenes and words which he attests, giving, in view of rising error,—Gnostic and Docetic,—the apostolic judgment on questions of the day, and founding the truth of Christian doctrine on a recognition of the historical Christ.

The subject and character of the epistle answer these conditions. The direct testimony to the real existence of Jesus Christ in the flesh, the declaration of spiritual tests (as in ch. i. 6, ii. 29, iii. 19, and in many other passages) which gives an introspective element to the epistle, and, lastly, the impressive re-delivery of familiar truths not freshly defined but exhibited in different mutual relations, are characteristic of an address given by an aged teacher to a generation of men who had not seen the Lord,—from whom therefore objective proof had been withdrawn, and who in consequence would desire some clear testimony of the facts about Jesus, and some definite tests of communion with God and of the reality of their spiritual condition. It is an address to the instructed. Much therefore is taken for granted; many elementary principles and truths of the Christian life are left unnoticed; and religious terms frequent in other parts of the New Testament are absent from this epistle. The apostle writes "because they have known Him that was from the beginning" (ii. 13), and his aim is a deepening of the spiritual life and a confirmation of faith.

After an introduction, giving his credentials as a witness and stating his aim, the apostle delivers his message to the church, "God is light" (i. 5). This thought is the subject of the epistle: it is illustrated by the opposite of light—darkness, and by analogous pairs of opposites, in which the principal theme is exhibited in different aspects: these are—righteousness and sin, truth and falsehood, love and hate, God and the world, life and death. To those ideas, which are in truth varied expressions of one and the same idea, the apostle turns and returns, not repeating himself, but on each reiteration of the truth adding some fresh thought and deeper truth. Through these opposites runs another thought—judgment or decision,—which is viewed not as a future but as an ever-present fact in the Christian life.

After the delivery of his message (ἀγγελία) the apostle proceeds to set forth some effects of the "light,"—fellowship with one another, confession of sin, forgiveness of sin (i. 5–10). This suggests one aspect of the object of the "message," freedom from sin, the test of which, *i.e.*, in other words the test of knowing God, is observance of His commandments, which are summed up in love (ἀγάπη) (ii. 1–11). Here the apostle reminds his readers why he sends the message; it is because (ὅτι) they to whom it comes are Christians, whose sins have been forgiven, who have known Christ, who have conquered Satan; it comes to all,—to little children, to young men, to the aged (ii. 12–14). Therefore let them not love the world nor the things of the world (ii. 15–17). Hence the thought of the end of the world and the signs thereof. Of these one is the Antichrist. There are now many Antichrists even in the nominal church. But there is a test of the true Christian,—to have the Father, the Son, the unction (χρίσμα) of the Holy Spirit, and the truth (ii. 18–28).

A new section begins with the thought of sonship of God. The test of sonship is doing righteousness because God is righteous. Sonship is a proof of the Father's love, and the condition of it is likeness to the Father (ii. 28–iii. 9). The connection is then traced between righteousness and love (10–13), between love and life and hate and death (14, 15). This suggests the range of love,—self-sacrifice even to death (16–18). Truth (suggested by reality of love) is shown to be tested by keeping the commandments, the first of which is love (19–23), the result is the indwelling of Christ which the Spirit testifies (24). The mention of the Spirit leads the apostle's thoughts once more, as in ch. ii. 18 *sq.*, to the distinction between true spirits and false. The test is the same, the acknowledgment that Christ has come in the flesh (iv. 1–6). The thought of the true Christian as distinguished from the false again suggests mutual love, which springs from God's love to us manifested by the mission of Christ. Mutual love is a proof of the indwelling Christ (7–13). Here the apostle pauses to bear impressive witness to the mission of Christ and the love of God (14–16), and then resumes the subject of love. A result of perfect love is confidence in the day of judgment. But absence of brotherly love means want of love to God (17–21). For the test of brotherly love is love to God, which consists in keeping His commandments through the faith in Jesus Christ that overcomes the world (v. 1–5). Jesus Christ then is the object of faith. Faith brings its own evidence, and its evidence is that God gave eternal life (6–12). To effect the knowledge of this (the possession of eternal life), and the belief in the Son of God, were the apostle's objects in writing. Such knowledge and belief bring assurance, from which results certainty of answer to prayer. The instance given is intercessory prayer (13–17). In conclusion the apostle recapitulates some of the leading truths dwelt upon in the epistle.

From this brief summary it will be seen that the sections are sometimes linked together by a manifest chain of reasoning, and that sometimes the concluding word in one paragraph suggests the fresh train of thought in the next. Some expositors detect a more logical sequence in the epistle. But the varying results of their expositions go to prove the improbability that the apostle had in view any such systematic arrangement. See, however. Düsterdieck, whose scheme is mainly followed by Alford, and Davidson, *Introduction to the Study of the New Testament.*

Where Written and to Whom Addressed.—The epistle was probably written at Ephesus, where the most ancient tradition places the closing scenes of St. John's life, and addressed to the church of Ephesus, or as an encyclical letter to the churches of Asia. In some Latin MSS., however, and in St. Augustine's *Quæst Evang.*, ii. 39, the address *ad Parthos* is found. Bede adds testimony to the same effect. But such a destination of the epistle is unlikely in itself, receives no support from the Greek Church, and is opposed to ecclesiastical tradition. Hence the best criticism rejects the superscription. It is variously accounted for. Whiston, in his *Commentary on the Epistles* (1719), suggests that the original address was πρὸς παρθένους, and that this abbreviated appeared in Latin as *ad Parthos;* according to others it is a corruption of *ad Sparsos*, "to the dispersed."

Before textual criticism was studied scientifically, much controversy turned upon the words contained in vers. 7 and 8 of ch. v. The disputed passage, ἐν τῷ ουρανῷ . . . ἐν τῇ γῇ, is now omitted by all the leading editors, on indisputable authority.

Second and Third Epistles.—These are interesting as the only examples of apostolic letters to private persons, except the epistle to Philemon, which have descended to us. Their genuineness is well attested, though with less decisive evidence than that of the First Epistle. Irenæus quotes 2 John 10, 11. Clement of Alexandria (*Strom.*, ii. 66) alludes to the First Epistle in a way which implies another, ἐν τῇ μείζονι ἐπιστολῇ. Dionysius of Alexandria (248 A.D.) makes express mention of the Second and Third Epistles; Alexander, bishop of Alexandria, cites a passage from the Second. The Muratorian canon, as already stated, probably contains a reference to the two minor epistles.

On the other hand, Eusebius mentions those epistles among the ἀντιλεγόμενα, or disputed writings (*H. E.*, iii. 25); Jerome writes that they were ascribed to John the Presbyter; Cyprian appears never to cite from them in his own writings (though he records words of Bishop Aurelius, who, speaking in a synod, quotes 2 John 9); Tertullian is equally silent; the Peshito does not contain either epistle.

In answer to the doubts thus raised it has been urged that the brevity and unimportance of the two minor epistles sufficiently account for the comparative silence of the first two centuries respecting them; that the existence of John the Presbyter rests on the slender authority of an inference from a statement by Papias (Eus., *H. E.*, iii. 39); that the style and expressions in the disputed epistles are so manifestly Johannine that, if they did not proceed from John the apostle, they must be the work of a conscious imitator, who, if honest, would have used his own name, if an intentional deceiver, that of the apostle; that the term ὁ πρεσβύτερος ("the elder," or "the aged"), 2 John 1, 3 John 1, is either a title of dignity or descriptive of age (if the first it may be paralleled by the use of συμπρεσβύτερος, 1 Pet. v. 1; if the second, by that of πρεσβύτης, Phil. 9, both applied by an apostle to himself).

The greeting in the Second Epistle ἐκλεκτῇ κυρίᾳ is variously interpreted—either (*a*) of a person (to the elect lady, to the elect Kyria, or to the lady Eclecta), or (*b*) of a church mystically addressed under a personal appellation. The last hypothesis is unlikely, and is not supported either by New Testament usage or by the early apocryphal writings. If either ἐκλεκτή or κυρία be a proper name, it is better to regard κυρία as such, since ἐκλεκτός is a term applied to all the saints, and in this very letter to the lady's sister, ver. 13. On the whole it is more probable that both ἐκλεκτή and κυρία bear their ordinary meanings, and that the A. V. is correct.

The Third Epistle is addressed to Gaius or Caius, a name so common that all identifications must be regarded as purely conjectural. From the epistle we learn that he was a Christian of good report, probably a layman, whom the apostle commends for his hospitality to certain missionaries of the faith who seem to have visited his city. Two other names are mentioned—Diotrephes, a leading and ambitious presbyter, who had refused to obey the apostle's injunctions, and Demetrius, either the bearer of the epistle or a member of the same church to which Caius belonged.

The time when and the place where these epistles were written must remain unknown from the absence of any data by which to determine them.

The works consulted for this article have been the commentaries of Alford, Ebrard, Lücke, and Reuss on the Epistles, and that of Westcott on the Gospel of St. John (*Speaker's Commentary*); Westcott, *The Canon of the New Testament;* Neander's *Planting of Christianity* (Bohn's trans., vol. ii.): F. D. Maurice's *Lectures on the Epistles of St. John;* and Davidson's *Introduction to the New Testament.* There are also commentaries, among others, by Düsterdieck, 1852; Luthardt, 1860; Haupt, 1869; Baur, 1848; Hilgenfeld, 1854, the last two representing the Tübingen school of criticism.

(A. C.*)

JOHN, Gospel of. See Gospels, vol. x. p. 728.

JOHN the Baptist, the last of the prophets and the "forerunner" of Christ, was born in a πόλις Ἰούδα (according to rabbinical tradition, at Hebron, but according to an ingenious modern interpretation of the phrase, at Jutta), in the beginning of the second half of the year 749 A.U.C. His father Zechariah was a priest "of the course of Abia;" his mother Elizabeth was related to Mary, the mother of Jesus, whose senior he was by six months. The circumstances of his birth are related with much detail in Luke i., but those of his early years are summed up in the single expression at ver. 80 that he "grew, and waxed strong in spirit, and was in the desert till the day of his shewing unto Israel." In his thirtieth year (Autumn, 779 A.U.C.) he began his public life in the "wilderness of Judæa," the wild district that lies between the Kidron and the Dead Sea, and particularly in the neighborhood of the Jordan, where multitudes were attracted by his eloquence. His appearance, costume, and habits of life were such as to recall to the minds of his hearers what they had read about the ancient prophets, and particularly about Elijah, who came to be regarded as his prototype. Nor was his preaching in substance different from theirs: his central doctrine was that "the kingdom of heaven" had come near, and preparation for its speedy arrival by an appropriate change of heart and life was the practical duty he urged. With regard to the nature of the baptism he administered, much uncertainty exists; for some discussion of its origin and meaning, the reader is referred to the article Baptism (vol. iii. p. 300). Amongst those who resorted to this rite was John's kinsman, Jesus of Nazareth, whom he had foretold, and now acknowledged, as one mightier than himself, the latchet of whose shoes he was not worthy to unloose. The duration of John's ministry cannot be determined with certainty; it terminated in his imprisonment in the fortress of Machærus, to which he had been committed by Herod Antipas, whose incestuous marriage with Herodias the Baptist had sternly rebuked, and where he was beheaded under circumstances which are familiar to every reader of the Bible. The date of this event cannot with safety be placed later than the end of 782 A.U.C. For our knowledge of John the Baptist we are almost entirely dependent on the notices contained in the Gospel narratives, but a brief account of his career is also given by Josephus (*Ant.*, xviii. 5): some legends of an obviously fictitious character are contained in the apocryphal Gospels.

JOHN, the name of twenty-two popes.

Popes.

JOHN I. (pope from 523 to 526) was a Tuscan by birth, and was consecrated pope on the death of Hormisdas. In 525 he was sent by Theodoric at the head of an embassy to Constantinople to obtain from the emperor Justin toleration for the Arians; but, whether designedly or not, he succeeded so imperfectly in his mission that Theodoric on his return, suspecting that he had acted only half-heartedly, threw him into prison, where he shortly afterwards died, Felix IV. (or III.) succeeding him. He was enrolled among the martyrs, his day being May 27.

JOHN II. (pope from 532 to 535), surnamed on account of his eloquence Mercurius, was elevated to the papal chair on the death of Boniface II. During his pontificate a decree against simony was engraven on marble and placed before the altar of St. Peter's. At the instance of the emperor Justinian he adopted the proposition *unus de Trinitate passus est in carne* as a test of the orthodoxy of certain Scythian monks accused of Nestorian tendencies. He was succeeded by Agapetus I.

JOHN III. (pope from 560 to 573), successor to Pelagius, was descended from a noble Roman family. He is said to have been successful in preventing an invasion of Italy by the recall of the deposed exarch Narses, but the Lombards still continued their incursions, and, especially during the pontificate of his successor Benedict I., inflicted great miseries on the province.

JOHN IV. (pope from 640 to 642) was a Dalmatian by birth, and succeeded Severinus after the papal chair had been vacant four months. While he adhered to the repudiation of the Monothelitic doctrine by Severinus, he endeavored to explain away the connection of Honorius I. with the heresy. His successor was Theodorus I.

JOHN V. (pope from 686 to 687) was a Syrian by birth, and on account of his knowledge of Greek had in 680 been named papal legate to the sixth œcumenical council at Constantinople. He was the successor of Benedict II., and after a pontificate of little more than a year, passed chiefly in bed, was followed by Conon.

JOHN VI. (pope from 701 to 705) was a native of Greece, and succeeded to the papal chair two months after the death of Sergius I. An attempt of the exarch Theophylact of Ravenna to extort from him certain concessions to the Byzantine emperor Tiberius was frustrated by the revolt of the Italian portion of the army with which he threatened Rome, who but for the intervention of the pope would have put their leader to death. Partly by persuasion and partly by means of a bribe, John also succeeded in inducing Gisulph, duke of Benevento, to withdraw from the territories of the church.

JOHN VII. (pope from 705 to 707), successor of John VI., was also of Greek nationality. He declined to accede to the request of the emperor Justinian II. that he should give his sanction to the decrees of the Quinisext or Trullan council of 691, on the ground that a papal legate was not present, and his death shortly afterwards delivered him from the necessity of committing himself to a more decided opinion. He was followed by Sisinnius.

JOHN VIII. (pope from 872 to 882), successor of Adrian II., was a Roman by birth. His chief aim during his occupancy of the papal chair was to build up his temporal power by uniting the various discordant political elements of Italy into a theocracy under his own immediate control, and by subordinating the empire to the ecclesiastical authority of Rome. The qualifications he brought to the task he had undertaken were a resolute and unbending will, an unscrupulous readiness to employ any means that might best advance his purpose, and a thorough mastery of diplomatic intrigue. Events, however, were so fatally opposed to his designs that no sooner did one of his schemes begin to realize itself in fact than it was shattered and dissipated by an unlooked-for chance. To take advantage of the opportunity of winning a recognition of the dependence of the imperial authority on that of Rome, as well as to obtain an influential alliance against his enemies, he agreed, in 875, to bestow the imperial crown on Charles the Bald, but that monarch was too much occupied in Germany to grant him much effectual aid, and about the time of the death of Charles he found it necessary to come to ignominious terms with the Saracens, who were only prevented from entering Rome by the promise of an annual tribute. Carloman, the opponent of Charles's son Louis, soon after invaded northern Italy, and, securing the support of the bishops and counts, demanded from the pope the imperial crown. John attempted to temporize, but Duke Lambert of Spoleto, a partisan of Carloman, whom events had recalled to Germany, entered Rome in 878 with an overwhelming force, and for thirty days virtually held him a prisoner in St. Peter's. He was, however, unsuccessful in winning any concession from the pope, who after his withdrawal carried out a previous purpose of going to France. There he presided at the council of Troyes, which promulgated a ban of excommunication against the supporters of Carloman—amongst others Adalbert of Tuscany, Lambert of Spoleto, and Formosus, bishop of Porto, who was afterwards elevated to the papal chair. In 879 John returned to Italy accompanied by Duke Boso of Provence, whom he adopted as his son, and made an unsuccessful attempt to get recognized as king of Italy. In the same year he was compelled to give a promise of his sanction to the claims of Charles the Fat, who received from him the imperial crown in 881. Previous to this, in order to secure the aid of the Greek emperor against the Saracens, he had agreed to sanction the restoration of Photius to the see of Constantinople, and had withdrawn his consent on finding that he reaped from the concession no substantial benefit. Charles the Fat, partly from unwillingness, partly from natural inability, gave him also no effectual aid, and the last years of John VIII. were spent chiefly in hurling vain anathemas against his various political enemies. According to the authority of Fulda, he was murdered by one of his near relations. His successor was Martin II.

JOHN IX. (pope from 898 to 900) was of German birth, and belonged to the Benedictine order. He not only confirmed the judgment of his predecessor Theodore II. in granting Christian burial to Formosus, but at a council held at Ravenna decreed that the records of the synod which had condemned him should be burned. Finding, however, that it was advisable to cement the ties between the empire and the papacy, John gave unhesitating support to Lambert in preference to Arnulf, and also induced the council to determine that henceforth the consecration of the popes should take place only in the presence of the imperial legates. The sudden death of Lambert shattered the hopes which this alliance seemed to promise. John was succeeded by Benedict IV.

JOHN X. (pope from 914 to 928) was deacon at Bologna when he attracted the attention of the empress Theodora, through whose influence he was elevated first to that see and then to the archbishopric of Ravenna. In direct opposition to a decree of council, he was also at the instigation of Theodora promoted to the papal chair as the successor of Lando. Like John IX. he endeavored to secure himself against his temporal enemies through a close alliance with the imperial power and the establishment of an independent Italian kingdom. With this view he in December 915 granted the imperial crown to Berengar, and with the assistance of the imperial troops and the forces of the duke of Benevento and Naples he took the field in person against the Saracens, over whom he gained a great victory on the banks of the Garigliano. The defeat and death of Berengar through the combination of the Italian princes again frustrated the hopes of a united Italy subservient to papal purposes, and after witnessing several years of anarchy and confusion John perished through the intrigues of Marozia, daughter of Theodora. His successor was Leo VI.

JOHN XI. (pope from 931 to 936) was born in 906, the son of Marozia and the reputed son of Sergius III. Through the influence of his mother he was chosen to succeed Stephen VII. at the early age of twenty-one. He was the mere exponent of the purposes of his mother, until her son Alberic succeeded in 933 in overthrowing their authority. The pope was kept a virtual prisoner in the Lateran, where he is said to have died in 936, in which year Leo VII. was consecrated his successor.

JOHN XII. (pope from 955 to 964) was the son of Alberic, whom he succeeded as patrician of Rome in 954, being then only sixteen years of age. His original name was Octavian, but when he assumed the papal tiara as successor to Agapetus II., he adopted the apostolic name of John, the first example, it is said, of the custom of altering the surname in connection with elevation to the papal chair. As a temporal ruler John was devoid of the vigor and firmness of his father, and his union of the papal office—which through his scandalous private life he made a byword of reproach—with his civil dignities proved a source of weakness rather than of strength. In order to protect himself against the intrigues in Rome and the power of Berengar II. of Italy, he called to his aid Otho the Great of Germany, to whom he granted the imperial crown in 962. Even before Otho left Rome the pope had, however, repented of his recognition of a power which threatened altogether to overshadow his authority, and had begun to conspire against him on whom he had newly conferred the dignity of emperor. His intrigues were discovered by Otho, who after he had defeated and taken prisoner Berengar, returned to Rome and summoned a council which deposed John, who was in hiding in the mountains of Campania, and elected Leo VIII. in his stead. An attempt at an insurrection was made by the inhabitants of Rome even before Otho left the city, and on his departure John returned at the head of a formidable company of friends and retainers, and caused Leo to seek safety in immediate flight. Otho determined to make an effort in support of Leo, but before he reached the city John had died, in what manner is uncertain, and Benedict V. had mounted the papal chair.

JOHN XIII. (pope from 965 to 972) was descended from a noble Roman family, and at the time of his election as successor to Leo VIII. was bishop of Narni. He had been somewhat inconsistent in his relations with his predecessor Leo, but his election was confirmed by the emperor Otho, and his submissive attitude towards the imperial power was so distasteful to the Romans that they expelled him from the city. On account of the threatening procedure of Otho, they permitted him shortly afterwards to return, upon which, with the sanction of Otho, he took savage vengeance on those who had formerly opposed him. Shortly after holding a council along with the emperor at Ravenna in 967, he gave the imperial crown to Otho II. at Rome in assurance of his succession to his father; and in 972 he also crowned Theophania as empress immediately before her marriage. On his death in the same year, he was followed by Benedict VI.

JOHN XIV. (pope from 984 to 985), successor to Benedict VII., was born at Pavia, and before his elevation to the papal chair was imperial chancellor of Otho II. Otho died shortly after his election, and, taking advantage of the opportunity, Boniface VII., on the strength of the popular feeling against the new pope, returned from Constantinople and placed John in prison, where he died either by starvation or poison.

JOHN XV. (pope from 985 to 996) is now generally recognized as the successor of Boniface VII., the pope of the same name who was said to have ruled for four months after the murder of Boniface being now omitted by the best authorities. John XV. was the son of Leo, a presbyter in Gallina Alba. At the time he mounted the papal chair Crescentius was patrician of Rome, but, although his influence was on this account very much hampered, the presence of the empress Theophania in Rome from 989 to 991 restrained also the ambition of Crescentius. On her departure the pope, whose venality and nepotism had made him very unpopular with the citizens, found it necessary to flee to Tuscany. The news of the approach of Otho III. made it possible for him soon afterwards to return, but he died of fever before the arrival of Otho, who elevated his own kinsman Bruno to the papal dignity under the name of Gregory V.

JOHN XVI. (pope or antipope from 997 to 998) was a Calabrian Greek by birth, and a favorite of the empress Theophania, from whom he had received the bishopric of Placentia. His original name was Philagathus. In 995 he was sent by Otho III. on an embassy to Constantinople to negotiate a marriage with a Greek princess. On his way back he either accidentally or at the special request of Crescentius visited Rome. A little before this Gregory V., in the beginning of 997, had been compelled to flee from the city; and the wily and ambitious Greek had now no scruple in accepting the papal tiara from the hands of Crescentius, to whom he consented to give up the temporal authority on condition that he recognized his subordination to the Western empire. The arrival of Otho at Rome in the spring of 998 put a sudden end to the treacherous compact. John sought safety in flight, but was discovered in his place of hiding and brought back to Rome, where after enduring cruel and ignominious tortures he was immured in a dungeon.

JOHN XVII., whose original name was Sicco, succeeded Silvester II. as pope in June 1003, but died in less than five months afterwards.

JOHN XVIII. (pope from 1003 to 1009) was, during his whole pontificate, the mere creature of the patrician John Crescentius, and ultimately he abdicated and retired to a monastery, where he died shortly afterwards. His successor was Sergius IV.

JOHN XIX. (pope from 1024 to 1033) succeeded his brother Benedict VIII., both being members of the powerful house of Tusculum. He merely took orders to enable him to ascend the papal chair, having previously been a consul and senator. He displayed his freedom from ecclesiastical prejudices, if also his utter ignorance of ecclesiastical history, by agreeing, on the payment of a large bribe, to grant to the patriarch of Constantinople the title of an œcumenical bishop, but the general indignation which the proposal excited throughout the church compelled him almost immediately to withdraw from his agreement. On the death of the emperor Henry II. in 1024 he gave his support to Conrad II., who along with his consort was crowned with great pomp at St. Peter's in Easter of 1027. In 1033 a conspiracy of the nobles compelled the pope to flee from Rome, but he was restored by Conrad, and died the same year in the full possession of his dignities. A successor was found for him in his nephew Benedict IX., a boy of only twelve years of age.

JOHN XXI. (pope from 1276 to 1277), successor to Adrian V., should, according to the order observed above, be named John XX., but there is an error in the reckoning through the insertion of an antipope before John XV. or some time after John XIX. At the time of his elevation to the papal chair he was cardinal-bishop of Tusculum, and he had previously been archbishop of Braga. He was a Portuguese by birth, and his original name was Pedro Juliani. The son of a physician, he had studied with distinction at Paris, was the author of several medical and scholastic treatises, and is mentioned by some chroniclers as a magician. His small affection for the monks, his unecclesiastical tone and habits, free and unaffected intercourse with every class of men, and proficiency in secular science, awakened against him the jealousy and distrust of the clergy, but probably his comprehensive and liberal policy would have shed exceptional lustre on the church had not his life been brought to a premature close through the fall of the roof which he had planned for one of his rooms in the palace of Viterbo. His successor was Nicholas III.

JOHN XXII. (pope from 1316 to 1334) was born at Cahors about 1244. His original name was Jacques d'Euse, and his father is said to have been a cobbler. Tradition also affirms that the son learned the same employment, but afterwards he was taken charge of by his uncle, a successful merchant, who rose to be chancellor of Robert of Sicily. Through the instruction of a Franciscan friar, Jacques d'Euse acquired, besides an acquaintance with theology, a mastery of canon and civil law, which afterwards stood him in good stead; but, although he was also versed in all the details of statesmanship, his learning was saturated with scholasticism, and his political ideas were narrowed by a mean and paltry ambition, the principal element of which was a miserly love of gold. He was small in stature and slightly deformed, and his features are said to have unpleasantly indicated his special moral defects. It is uncertain whether he ever joined the Franciscan order, but at any rate he afterwards had intimate connections with the court of Naples, and some time before 1300 he was, at the instance of the king, appointed by Boniface VIII. bishop of Frejus. By means of forged letters purporting to have the authority of the king of Naples, Clement V. was induced in 1310 to bestow upon him the see of Avignon; and, notwithstanding that the fraud was soon discovered, he so recommended himself to the pope by his prudent conduct and his knowledge of law that in 1312 he was named cardinal-bishop of Porto. Robert of Naples also condescended to forget the liberty that had been taken in the use of the royal seal, and, on the death of Clement V. in 1316, the cardinals, through the liberal expenditure of Neapolitan gold, were won over to elect the bishop of Porto to the papal chair. The leanings of the new pope towards the French party were at once shown by his choice of Avignon as his residence, and by his first promotion of cardinals, all of whom except one were French. During the strife for the empire between Louis of Bavaria and Frederick of Austria, John took no active part on either side, but made use of the opportunity quietly to establish an Italian kingdom under the rule of King Robert of Sicily, and after fortune declared for Louis at the battle of Muhldorf in 1322 continued to act as if the imperial throne were still vacant. In consequence of this, Louis found himself compelled to enter into a league with the Ghibellines, whereupon the pope summoned him to appear before him at Avignon, and, on his declining immediate compliance with the request, promulgated against him a ban of excommunication. The empire was offered to Charles the Fair of France, who had married a daughter of the emperor Henry VII., but her death lost him his chief support in Germany; and Louis, owing in a great measure to the influence of the Franciscans, whom the persecutions of John had greatly incensed against the authority of Rome, was accepted as emperor with the unanimous consent of the states at Ratisbon in 1324, a decision fully confirmed by the diet of Spires in 1326. In the following year he experienced equal good-will at the diet of the imperial feudatories at Trent. After receiving the crown of Italy at Milan he entered Rome with the general acclamation of the inhabitants, and was crowned emperor by two excommunicated bishops. But, although the election of Peter of Corvara as rival pope under the name of Nicholas V. was greeted with the loud approval of the citizens, the threatening attitude of Robert of Naples made it impossible for the emperor and antipope to prolong their stay in Rome, and afterwards a gradual reaction against the imperial cause took place throughout the whole of Italy. Nicholas was taken prisoner at Pisa, but on making a complete recantation of his errors was forgiven and absolved. With Louis, however, the pope altogether declined to come to terms, although he found it impossible to establish a rival against him. The last years of John were disquieted by a dispute regarding his tenet—held by most theological authorities to be heretical—that the saints at death fall asleep and do not enjoy the beatific vision until after the resurrection. So great latterly became the general clamor against the doctrine that he found it necessary to make an ambiguous semblance of retracting what he had formerly promulgated with passionate zeal. He, however, never showed any tendency to relent in his persecution of the Franciscans, and his persistent animosity against them was a not unimportant element among the influences which produced the Reformation. He died in 1334. By means of *annates* he had greatly enriched the papal treasury. His successor was Benedict XII.

JOHN XXIII. (pope from 1410 to 1415) was born in Naples about 1360. He was of noble descent, his original name being Balthasar Cossa. In his youth he had, along with his brothers, served as a corsair, and at the university of Bologna, which he afterwards entered, he led a loose and intemperate life. After occupying the office of archdeacon of Bologna, he became chamberlain of Boniface IX., and in that office greatly enriched both himself and the pope by his unscrupulous traffic in indulgences. In recognition of the high value of his services he was in 1402 created by Boniface a cardinal, and shortly afterwards he was appointed papal legate to Bologna, which he succeeded in wresting from the Visconti. The scandalous and cruel excesses in which he indulged when governor of the city caused Gregory XII. to pass against him a sentence of excommunication, but he was restored to his full dignities by Alexander V. The death of this pope, which took place suddenly at Bologna in 1410, was generally believed to have been contrived by the governor, but the cardinals were unanimous in electing him his successor, other two popes, Benedict XIII. and Gregory XII., the predecessors of Alexander, being still alive. Previously John had entered into a close alliance with Louis of Anjou, and he now united with him against Ladislaus of Naples, but notwithstanding the victory of Rocca Secca in 1411, he found it necessary to come to ignominious terms with Ladislaus in 1412. The compact was, however, congenial to neither party, and in the following year Ladislaus, advancing on Rome, compelled the pope to flee to Florence and thence to Bologna. In his extremity John implored the protection and help of the emperor Sigismund, who condescended to acknowledge him to the extent at least of requiring him to summon a council at Constance by which his claims and that of the other two rival popes should be decided. John opened the council in person in 1414, but, after consenting to abdicate preliminarily to the council deciding on his claims, he made his escape in disguise to Freiburg, where he obtained the protection of the duke of Austria. On his refusal to return he was solemnly deposed by the council as guilty of a long list of heinous crimes. The duke of Austria then surrendered him to the emperor, and after he had acknowledged the justice of his sentence he was confined in the castle of Heidelberg. At the end of four years' imprisonment he obtained his freedom, in all probability through a bribe, and, having made his submission to his successor Martin V., he was appointed by him cardinal-bishop of Frascati and dean of the college of cardinals, but he died a few months afterwards.

Greek emperors.

JOHN I. (925–976), emperor of Constantinople, surnamed on account of his short stature *Zimisces*, was descended from a distinguished family of Cappadocia, and was the nephew of Nicephorus Phocas, whom he aided to obtain the throne, and with whom he afterwards shared the military command of the empire. Being, however, deprived of this dignity through the intrigues of the emperor's brother Leo, he entered into a conspiracy to assassinate Nicephorus, which was put into execution on the 10th December, 969. The reign of Zimisces is chiefly remarkable for his victories over the Russians, and the conquest of Bulgaria. Afterwards he achieved many brilliant exploits against the Saracens, but on his way home from his Syrian campaign he was seized near Constantinople with a sudden illness, caused it is supposed by poisoning, and died there in January, 976.

JOHN II. (1088–1143), Comnenus, surnamed *Kalojoannes* (John the Good), was the eldest son of the emperor Alexius, whom he succeeded on the throne in 1118. On account of his mild and just reign he has been called the Byzantine Marcus Aurelius, but he displayed little vigor in the internal administration of his kingdom, or in extirpating the governmental corruptions and abuses he had inherited. Nor did his various successes against the Hungarians, Servians, and Turks, though they won him the high admiration of his soldiers, add much to the stability of his kingdom. He was accidentally killed during a wild-boar hunt on Mount Taurus, 8th April, 1143.

JOHN III. (1193–1254), Vatatzes, surnamed *Ducas*, emperor of Nicæa, was born in 1193, and earned for himself such distinction as a soldier, that in 1222 he was chosen to succeed Theodore I. His successes in war, which earned for him great renown, were rendered of little advantage to him through the intrigues of other sovereigns, but he administered the internal affairs of his dominions with much enlightenment and skill, and devoted great attention to agriculture. He died 30th October, 1254,—not in 1255 as writers previous to Finlay have generally alleged.

JOHN IV., Lascaris, emperor of Nicæa, son of Theodore II., was born about 1250. His father dying in 1258, Michael Palæologus conspired shortly after to make himself regent, and in 1261 dethroned the boy monarch and put out his eyes. John died in prison.

JOHN V. (1329–1411), Cantacuzenus. See CANTACUZENUS, vol. v., p. 25.

JOHN VI. (1332–1391), Palæologus, emperor of Constantinople, born in 1332, was the son of Andronicus III., whom he succeeded in 1341. From 1342 John Cantacuzenus shared the throne with him, till, on the abdication of his colleague, who had been virtually the sovereign, he became sole emperor in 1334. His reign was marked by the gradual dissolution of the imperial power through the rebellion of his son Andronicus, and the encroachments of the Ottomans, to whom, in 1381, John acknowledged himself tributary.

JOHN VII. (1390–1448), Palæologus, emperor of Constantinople, son of Manuel II., was born in 1390, and in 1425 succeeded to the semblance of dominion and the wreck of the empire. To secure the favor of the Latins he consented to the union of the Greek and Roman Churches, which was ratified at Florence in 1439. The union failed of its purpose, but by his prudent conduct towards the Ottomans he succeeded in holding possession of Constantinople till his death, in 1448.

King of England.

JOHN (1167–1216) king of England, youngest son of Henry II. and Eleanor of Aquitaine, and third king of the Plantagenet family, was born December 24, 1167. He was his father's favorite child, and Henry hoped to bestow on him the kingdom of Ireland. The Irish princes did homage to John at Oxford in 1177, and in 1185 he was sent to Ireland. His arrogant behavior roused the resentment of the natives, and he was recalled in disgrace. In the last revolt of Richard against Henry, John was base enough to join with his father's enemies. This treachery was the death-blow of Henry II. (1189). Richard, on his accession, made the most ample provision for John, giving him several English counties, and marrying him to the heiress of the great earldom of Gloucester. But he had so little trust in his brother's character, that, before his own departure on the third crusade, he bound John to stay away from England for three years. At the end of the term John returned, and harassed Richard's justiciar, William Longchamp. The unpopularity of Longchamp enabled John, aided by the archbishop of Rouen, to lead a revolutionary movement by which Longchamp was deprived of the justiciarship, and John recognized as *summus rector* of the kingdom; but the real power remained with the archbishop of Rouen. When the news of the king's captivity arrived, John entered into an active alliance with Philip II. of France, Richard's malignant enemy, and tried to seize the reins of government, asserting that the king was dead. But he was baffled by the fidelity of Richard's ministers and mother, and at Richard's return his castles had to be surrendered to the king. Richard treated John with great generosity, and for the rest of his reign John gave no further trouble. Richard on his deathbed declared John his heir. The principle of primogeniture, now generally adopted, would have pointed out Arthur of Brittany, son of John's elder brother Geoffrey, as the heir, and Philip II. made himself the champion of Arthur. John made fresh enemies by divorcing his wife, and marrying Isabella, heiress of the count of Angoulême, who was already betrothed to the Count of La Marche. The anger of the La Marche family caused a fresh outbreak of war, in which Arthur became involved. In a misguided attempt to capture his grandmother Eleanor, in the castle of Mirabeau, he was defeated and taken prisoner by John, who marched with great swiftness to his mother's aid. Arthur now disappears from history; and though there is no certain information about his death, it was generally believed at the time that John murdered him. Philip's court of peers declared John guilty, and sentenced him to forfeiture. John abandoned himself to pleasure, and made no attempt to defend his dominions; he showed such complete indifference, while Philip was reducing castle after castle in Normandy, that it was said he was spell-bound by witchcraft. In 1204 all Normandy was lost. Anjou, Maine, and part of Aquitaine soon followed the fate of Normandy; John made only feeble or abortive attempts to save them. In 1205 his great quarrel with the church began. The monks of Canterbury had elected their sub-prior to the archbishopric, and John had nominated a minister of his own; all parties appealed to Pope Innocent III., who took the matter into his own hands, and ordered the convent proctors to elect Stephen Langton, an Englishman already distinguished by learning and character. John's refusal to accept Langton brought sentence of interdict on his kingdom (1208). He was personally excommunicated in 1209, and in 1211 the pope issued a bull deposing him from his throne; the execution of the decree was committed to Philip, who prepared to invade England. John at last gave way, moved chiefly by a prophecy that on the next Ascension Day he would be no longer king. He made an abject submission to the papal legate Pandulph, agreeing to hold his kingdom henceforth as a tributary fief of the popedom. Thus the ecclesiastical difficulty was settled, but now John had to settle a quarrel with his own people. He had incurred their hatred by his personal vices, by his cruelty and perfidy, of which the supposed murder of Arthur was only one instance among many, and by his exaction of taxes greatly in excess of the customary rates. The barons of the north began the quarrel by refusing to accompany John on the expedition to France which he planned immediately after his absolution, alleging that their tenures did not oblige them to service abroad. Langton restrained the king from doing immediate vengeance on the barons, and in the meantime an important assembly was held at St. Albans (the first to which representatives from the towns are known to have been summoned), at which the justiciar promised in the king's name that the laws of Henry I. should be observed. At an assembly at St. Paul's the same year, Langton, who was the moulding spirit of the movement, produced the charter of Henry I., which became the basis of Magna Charta. John was now bent on trying to knit together the Germanic confederacy against Philip, which had been originated by Richard. He showed both policy and energy in this matter, but the barons of Poitou failed him at the critical moment of the war, and his nephew the emperor Otho was utterly defeated by Philip at Bouvines. John was forced to conclude the peace of Chinon (1214), by which he ceded to Philip all his claims on lands lying north of the Loire. He had scarcely returned to England when his barons formed a confederacy against him at Bury St. Edmunds. He attempted to bribe the clergy by granting them free election; but they stood firm to the national cause. The city of London gave its adhesion to the barons, and John found himself abandoned by all. He was obliged to grant the demands of the barons, and to sign (at Runnymede, June 15, 1215) the Great Charter, which for two hundred years was to be the watchword of English freedom. John signed the charter without the least intention of keeping it, and he found a powerful ally in his new master Innocent III., who issued a bull against the charter, and suspended Langton. Langton went to Rome to appeal, and the patriot party was thus deprived of its wisest leader. War soon broke out again, but John was able to obtain a host of foreign mercenaries, and the barons were driven to make alliance with France. Louis, son of Philip II., arrived in England in May, 1216, and John's unusual audacity and success deserted him at once. In three months the greater part of the country was in the hands of Louis. Yet the national mistrust of the foreigner was already causing a reaction in favor of John, when in marching across the Wash he met with the accident which led to his death. He was overtaken by the tide, lost all his baggage and treasure, and narrowly escaped himself. Vexation and fatigue, aggravated by excess in eating and drinking, brought on an attack of dysentery; with difficulty he reached Newark, where he died October 19, 1216.

The reign of John is a turning point in English history, and marks the beginning of a new era. (1) The separation of Normandy insured the free development of English life, and the absorption of the Norman nobility in the English people. (2) Magna Charta marks the first united attempt of the English people to limit the power of the king. Hitherto the people had been the allies of the royal power against the baronage; for the two following centuries they are leagued with the baronage and the church against royal tyranny. (3) The surrender of John's kingdom to the pope, followed by the opposition of Innocent to English freedom and the papal exactions of the next reign, caused a change of feeling towards the papacy, and led to the anti-Roman legislation which went on from the reign of Edward I. till the Reformation. (E. S. A.)

Kings of France.

JOHN I., king of France, son of Louis X. and Clementia of Hungary, was born, after his father's death, 15th November, 1316, and only lived seven days.

JOHN II. (1319–1364), surnamed the Good, son of Philip VI. and Jane of Burgundy, was born in 1319, and succeeded his father in 1350. On the 19th September, 1356, he was defeated and taken prisoner by the Black Prince at the battle of Poitiers. He gained his liberty at the peace of Bretigny in 1360; but his son the duke of Anjou, whom he left as hostage in England, having fled, John thought himself bound to return to captivity. He died in London in 1364. See FRANCE, vol. ix., p. 482.

Kings of Poland.

JOHN II. (1609–1672), Casimir, king of Poland, second son of Sigismund III. and the duchess Constantia of Austria, was born March 21, 1609. After journeying in several countries of Europe, he in 1640 joined the Jesuit order at Rome, and shortly afterwards was chosen cardinal. Subsequently he returned to Poland, where he resided as a layman until the death of his brother, 20th November, 1648, when he succeeded him on the throne. In September, 1668, he abdicated, after which he went to France, and became abbot of St. Germains de Prés and of St. Martin at Nevers. He died September 16, 1672. For the events of his unfortunate reign see POLAND.

JOHN III. (1624–1696), Sobieski, king of Poland, son of Jakob Sobieski, castellan of Cracow, was born 2d June, 1624, at Olesko in Galicia. He so distinguished himself in the defensive wars of Poland that in 1667 he received the supreme command of the army, and on the death of Michael Corybut was chosen king, 20th May, 1674. He died June 17, 1696.

Kings of Portugal.

JOHN (JOÃO) I. (1357–1433), king of Portugal, the natural son of Pedro I. (el Justicieiro), was born at Lisbon on April 22, 1357, and in 1364 was created grand-master of Aviz. On the death of his lawful brother Ferdinand I., without male issue, in October, 1383, strenuous efforts were made in various quarters to secure the succession in the legitimate line for Beatrice, the only child of Ferdinand I., who as heiress apparent had been married to John I. of Castile; but the popular voice declared decisively against an arrangement by which Portugal would virtually have become a Spanish province, and John was after violent tumults proclaimed protector and regent in the following December. In April, 1385, he was unanimously chosen king by the estates of the realm at Coimbra, and the coronation took place some little time afterwards. The king of Castile resorted to arms on behalf of his wife, and invested Lisbon, but the besieging army was compelled by the ravages of a pestilence to withdraw, and subsequently by the decisive battle of Aljubarrota (14th August, 1385) the stability of John's throne was permanently secured. Hostilities continued, however, with more or less of interruption until the death of John of Castile, without leaving issue by Beatrice, in 1390; and even after that event relations between the two countries continued to be strained. In the meanwhile John went on consolidating the power of the crown at home and the influence of the nation abroad. In 1415 Ceuta was taken from the Moors by his sons who had been born to him by his wife Philippa, daughter of John, duke of Lancaster; specially distinguished in the siege was Prince Henry, afterwards generally known as "the Navigator," who in this and also in the following reign did so much to prepare the way for the position of colonial importance subsequently held by Portugal. Porto Santo and Madeira were occupied respectively in 1419 and 1420. John I., sometimes surnamed "the Great," and sometimes "father of his country," died August 11, 1433, in the forty-eighth year of a reign which had been characterized by great prudence, ability, and success; he was succeeded by his son Edward or Duarte, so named out of compliment to Edward III. of England.

JOHN II. (1455–1495), "the perfect," king of Portugal, succeeded his father, Alphonso V., in August, 1481. His first business after ascending the throne was to curtail with a vigorous hand the overgrown power of his aristocracy; noteworthy incidents in the contest were the execution (in 1483) of the duke of Braganza for correspondence with Castile, and the murder, by the king's own hand, of the youthful duke of Viseu for conspiracy. This reign was signalized by Bartolommeo Dias's discovery of the Cape of Good Hope in 1486, and also by the equipment (1493) of a squadron for exploration of the new world recently discovered by Columbus. The latter proceeding led to disputes with Castile, until the claims of the disputants were adjusted by the famous treaty of Tordesillas (7th June, 1494). John II. died, without leaving male issue, in October, 1495, and was succeeded by his brother-in-law Emmanuel (Manoel) I.

JOHN III. (1502–1557) of Portugal was born at Lisbon, June 6, 1502, and ascended the throne as successor of his father Emmanuel I. in December, 1521. In 1524 he married Catherine, sister to the emperor Charles V., who in turn shortly afterwards married the infanta Isabella, John's sister. Succeeding to the crown at a time when Portugal was at the height of its political power, and Lisbon in a position of commercial importance previously unknown, John III., unfortunately for his dominions, yielded so far to the counsels of the clerical party among his subjects as to consent to the introduction of the Inquisition (about1526); this led to measures of tyranny and oppression which, notwithstanding the enactment of many wise laws, soon avenged themselves in disastrous consequences to the commercial and social prosperity of his kingdom. The conflicts in which Portugal engaged with the Moors and the Turks during his reign were comparatively unfruitful of results. He died of apoplexy on June 6, 1557, and was succeeded by his grandson Sebastian, then a child of only three years.

JOHN IV. (1603–1656), "the Fortunate," of Portugal, was born at Villaviciosa in March, 1603, succeeded to the dukedom of Braganza in 1630, and married Luisa de Guzmad, eldest daughter of the duke of Medina Sidonia, in 1633. By the unanimous voice of the people he was raised to the throne of Portugal (of which he was held to be the legitimate heir) at the revolution effected in December, 1640, by a conspiracy of the nobles against the grievances inflicted by Spain and the insolence of Philip IV.'s minister, the duke of Olivarez. His accession ultimately led to a protracted war with Spain, of which the final issue—the recognized independence of Portugal—did not declare itself until a subsequent reign (1668). He died after a prosperous reign of sixteen years, on November 6, 1656, and was succeeded by his son Alphonso VI.

JOHN V. (1689–1750) of Portugal was born at Lisbon on October 22, 1689, and succeeded his father Pedro II. on December 1706, being proclaimed on January 1, 1707. One of his first acts was to intimate his adherence to the Grand Alliance, which his father had joined in 1703, and his resolution to take his full share in the war then in progress. Accordingly his general Das Minas, along with Lord Galway, advanced into Castile, but sustained the defeat of Almanza (14th April). In October, 1708 he married Maria Anna, daughter of Leopold I., thus strengthening the alliance with Austria; the series of campaigns which ensued were equally unsuccessful with the first, but ultimately terminated in a favorable peace with France in 1713 and with Spain in 1715. The rest of his long reign presents no striking features, except that it was characterized by perfect subservience on his part to the clergy, the kingdom being administered by ecclesiastical persons and for ecclesiastical objects to an extent that gave him the best of rights to the title "Most Faithful King," bestowed upon him and his successors by a bull of pope Benedict XIV. in 1748. John V. died on July 31, 1750, and was succeeded by his son Joseph.

JOHN VI. (1769–1826) of Portugal was born at Lisbon, May 13, 1769, and received the title of prince of Brazil in 1788. In 1792 he assumed the reins of government in name of his mother Queen Mary I., who had become insane. He himself having been brought up in an unhealthy ecclesiastical atmosphere, and being naturally of a somewhat weak and helpless character, was but ill adapted for the responsibilities he was thus called on to undertake. In 1799 he assumed the title of regent, which he retained until his mother's death in 1816. The political relations of Portugal with England and France from the period of the first coalition against France in 1793 to the treaty of Fontainebleau (1807), by which the partition of the first-named country was agreed upon, will be elsewhere explained (see PORTUGAL). In consequence of the latter treaty the prince of Brazil found it necessary to leave the kingdom (November, 1807), and transfer the seat of his government to Rio Janeiro. The occupation and annexation of the whole country immediately ensued; against this he recorded his protest in November, 1808, and in a more practical manner by the seizure of French Guiana in the following year. He also entered into alliance with England in 1810, and was a party to the treaty of Paris in 1814. In 1816 he was recognized as king of Portugal on the death of Mary, but he continued to reside abroad; the consequence was the spread of a feeling of natural dissatisfaction, which resulted in the peaceful revolution of 1820, and the proclamation of a constitutional government, to which he swore fidelity on his return to Portugal in 1822. In the same year, and again in 1823, he had to suppress a rebellion led by his son Dom Miguel, whom he ultimately was compelled to banish in 1824. He died at Lisbon, March 26, 1826, and was succeeded by Pedro IV.

King of Saxony.

JOHN (1801–1873), king of Saxony, brother and successor of Frederick Augustus II., and younger son of Duke Maximilian and Caroline of Parma, was born at Dresden, 12th December, 1801. In youth he showed a special bent towards mathematics, and he also studied with great diligence law and history. His interest in Italian literature having been awakened by a journey to Italy in 1821, he in 1825 printed for private circulation, under the pseudonym of *Philalethes*, a metrical translation of a portion of Dante's *Inferno*, and in 1829 he published a complete translation of the *Divine Comedy*, with critical and historical notes. At an early age he also took an active part in political life. In 1821 he became a member of the college of finance, of which he was president from 1825 to 1831. From 1831 to 1846 he acted as commander of the national guards. On ascending the throne in 1854 he followed the same enlightened and liberal policy as his brother, and introduced several reforms of great benefit to the country. In the wars of 1866 he sided with Austria against Prussia, and on that account had to submit to the payment of a large sum of money and the cession of the fortress of Königstein at the conclusion of peace. He, however, afterwards entered the North German federation, and his troops took a very prominent and distinguished part in the Franco-Prussian war of 1870–71. He died at Dresden, October 29, 1873.

Spanish kings.

JOHN (JUAN) I. (1350–1395), king of Aragon, was born December 27, 1350, and succeeded his father, Pedro IV., in 1387. He left the affairs of his kingdom to a large extent in the hands of his wife Yolande, a granddaughter of John the Good, king of France, while he himself led a life of pleasure and inglorious ease. A characteristic feature of his reign was the encouragement he gave to the poetical institutions of the troubadours, a "consistory of the Gaya Sciencia" having been founded at Barcelona under his auspices in 1390. In that year he repelled an attack by the count of Armagnac, who had laid claim to the domains in Majorca previously in possession of his family; and in 1392 he quelled a revolt of the Sardinians. He died in 1395, in consequence of an accident on the hunting field, and was succeeded by his brother Martin.

JOHN II. (1397–1479), king of Aragon from 1458, was the younger son of Ferdinand I. (the Just), and was born June 29, 1397. He was twice married, —first to Blanche, daughter of Charles III. of Navarre, by whom he had three children (Carlos, heir to the crowns of Navarre and Aragon; Blanche, for some time the wife of Henry IV. of Castile; and Eleanor, wife of Gaston, count of Foix); and afterwards (in 1447) to Joanna Henriquez, of the blood-royal of Castile, by whom he became the father of Ferdinand V. (the Catholic). For a long time he acted as lieutenant-general in Aragon for his brother Alphonzo V., whom business detained in his Neapolitan dominions; in this capacity he intervened frequently in the affairs of Castile, where his weak and inexperienced kinsman John II. occupied the throne, and on one occasion (1444) he invaded that kingdom, but was defeated at Olmedo. On his second marriage he irritated his son Carlos and the community by sending his queen Joanna to share the administration of Navarre with his son; in the revolt which ensued victory declared for John, Carlos himself being reduced to captivity (1452), in which he was detained for many months. In May, 1458, John succeeded his brother in Aragon, Sicily, and Sardinia; but the influence of Joanna Henriquez prevented him from recognizing the legitimate claims of his own eldest son to the reversion; an attempt by Carlos to obtain support in other quarters led to his arrest and imprisonment, from which he was released only after Catalonia had risen in arms and the king of Castile had begun an irruption into Navarre. Shortly after this temporary triumph Carlos was carried off by a fever in September, 1461, bequeathing the crown of Navarre to his sister Blanche and her posterity. Ferdinand, the half brother of Carlos, was now put forward as heir apparent of the Aragon-ese throne, but the indignant Catalonians raised a revolt which did not come to an end until December, 1472. Immediately afterwards John entered upon a war with Louis XI. of France in consequence of disputes about Roussillon and Cerdagne; first successful, but afterwards worsted, this bold and energetic but ambitious and unjust prince died January 20, 1479, before the conclusion of the peace. He was succeeded by Ferdinand V.

JOHN (JUAN) I. 1358–1390), king of Castile and Leon, born in August, 1358, was the son of Henry II. ("El Bastardo"), whom he succeeded in 1379. At his accession the Lancasterian claims to the throne of Castile were renewed, and gained the support of Portugal; the result was a war with the latter power, which ended in a marriage (1382) between John and the Portuguese infanta. The peace thus ratified did not subsist long, for, on the death of Ferdinand of Portugal in the following year without male issue, John sought to establish a claim to the succession on behalf of his wife, and crossing the frontier, penetrated as far as to Lisbon, to which he began to lay siege while John, the grand-master of Aviz, was being proclaimed king. Compelled by pestilence and other unfavorable circumstances to withdraw, he encountered the Portuguese in the neighborhood of Aljubarrota in August of 1385; the disastrous defeat he there sustained was followed by a descent of John of Gaunt, duke of Lancaster (July, 1386), which led to the conclusion of the peace of Troncoso (1387), in virtue of which the constantly recurring disputes about the crown were settled by the marriage of the crown prince Henry to Catherine, the representative of the Lancasterian claims. The last four years of the reign of John were marked by important legislative reforms in the town brotherhoods (*hermandades*), in the army, and in the system of taxation. In 1390 he was killed by a fall from his horse, and was succeeded by his son Henry III.

JOHN II. (1404–1454) of Castile and Leon, grandson of the preceding, succeeded to the throne when only twenty-two months old. Until 1412 the regency was shared with his mother Catherine by his uncle Ferdinand (afterwards Ferdinand IV. of Aragon); this period was marked by much internal prosperity and by important conquests from the Moors, especially by the capture of Antequera. Unfortunately for Castile, Ferdinand was called away (in 1412) to occupy the throne of Aragon; but it was not until after the death of Catherine in 1418 that John's weakness and incapacity came to be fully seen. Abandoning himself recklessly to a life of frivolous pleasure, he left the affairs of his kingdom in the hands of a few favorites, such as the archbishop of Toledo and Juan de Velasco. From 1423 onwards he was the tool principally of Alvaro de Luna, a brilliant, ambitious, and crafty courtier. Henceforward the history of his reign is largely a record of the internal commotions, rising sometimes to the height of civil war, occasioned by the nobles' jealousy of Alvaro, and by the oppression to which the common people were exposed under the absolutist policy of that minister. The period of John II. is chiefly and most favorably remembered in connection with the history of Castilian literature: a man of some literary turn himself, he was a liberal patron of letters; and his countenance gave an impulse to refinement and culture of literary style, the effects of which were distinctly traceable through several subsequent generations. By his first wife John II. became the father of Henry IV., his successor; the daughter of a second marriage was Isabella, afterwards known as "the Catholic." He died in June, 1454.

Don John of Austria.

JOHN, Don, of Austria (1545–1578), was the bastard son of the emperor Charles V. by Barbara Blomberg, the daughter of a well-to-do citizen of Ratisbon. He was born in that free imperial city (according to a not very probable tradition in the "imperial hostelry" there, which still survives as the inn of the Golden Cross), on February 24, 1545, the anniversary of his father's birth and coronation, and of the battle of Pavia. On another visit to Ratisbon in the following year, after arranging a marriage between the fair Barbara and one of his German courtiers, Hieronymus Piramis Kegell, the emperor carried off the young Geronimo, as he was then conveniently called. The worthy Don Luis de Quijada, to whose care he was hereupon confided, watched over his early childhood with jealous care. It was at first sought to conceal the connection between the emperor and the child of his declining years, who was brought up in retirement, chiefly in Quijada's castle of Villagarcia in Spain. In the year before the emperor's death, however, the boy was brought into the immediate neighborhood of San Yuste, where his presence brightened the close of his father's life. In his last will Charles V. acknowledged "Geronimo" as his son, and commended him to the care of his successors, expressing a wish that he should take monastic vows, but that in the event of his declining these a handsome income should be provided for him out of the revenues of Naples.

In September, 1559, the boy was publicly recognized by King Philip II. as his brother; and henceforth he resided at court under the name of Don Juan d'Austria as a member of the royal family. With the heir to the throne, the unhappy Don Carlos, his relations were so friendly that, when at the end of the year 1567 the infante was plotting his flight from Spain, he confided his more or less treasonable scheme to his half brother, and even requested the latter to accompany him on his expedition. A sense of duty, at which it is difficult to cavil, prompted Don John to reveal this unsought confidence to the king, and thus he helped to bring about the fatal catastrophe, as it proved, of the imprisonment of Don Carlos.

It was not the habit of Philip II. to allow those who served him to choose their own seasons and methods of doing so. The impetuous Don John, whom the king would have preferred to see a monk, had in 1565 been refused permission to serve in the fleet ordered to sail for the relief of Malta; and an express royal command had been needed to bring him back when on the point of making the voyage on his own account. His obedience was rewarded when in 1568 he was appointed to the great office of *capitan general de la mar.* His first actual service, however, was by land, and of a kind unattractive to any but the genuine Spanish blood. In 1569 he was charged with a task, the execution of which the captain-general of Granada, the marquis of Mondejar, had begun, but was unwilling relentlessly to complete. The reformation of the converted Moriscoes had come to mean the suppression of the remnants of their national as well as religious life; and after the insurrection of Aben Humeya had been overcome, the wholesale deportation of all the Moriscoes from their habitations was decreed, and executed on All Saints' Day, 1570. Don John cannot be held responsible either for the cruelty of this ordinance or for the general policy of the war, which from the time when the jealousy of the king had allowed him to take the field, instead of remaining at Granada, he had carried on with vigor and skill. The capture of Guejar had been his first deed of arms (December, 1569); it had been followed by that of Galera; and in August, 1570, the Alpujarras mountains were cleared of the Moriscoes, of whom more than 10,000 are said to have been killed or captured in the space of a single month.

Before long a nobler crusade engaged the energy of the obedient and successful commander. Philip II., though he was during nearly the whole of his reign engaged in hostilities with the Turks, had hitherto displayed no great vigor in resisting their still unceasing inroads upon the domain of Christendom. His fleet had for the time saved Malta; but Cyprus was torn by the infidel from the Venetians without his having offered timely co-operation for its defence (1571); and the barbarous proceedings of the conquerors had filled Europe with horror and shame. Not even the waters of the Adriatic were secure from the Turkish vessels, and the league which shortly before the loss of Cyprus papal diplomacy had succeeded in knitting between Spain, Venice, and Rome, and which purported to aim at the extinction of the Mahometan power, had as yet remained a dead letter. At length the forces of the allies—208 galleys, 6 galeases, and a number of smaller craft, with more than 20,000 Spanish, German, and Italian soldiers on board—assembled at Messina. Don John of Austria had been named admiral of the league, with power (granted at the request of Pope Pius V.) of free action after consultation with his captains and the Venetian commander. Thus the day of Lepanto was in every sense his own, though it was his good fortune that the Turks had underestimated his numbers, which were in truth little inferior to theirs. The Christian victory was complete. Only forty of the Turkish vessels effected their escape, the rest being burnt or captured; and 35,000 of their men were slain or captured, while 15,000 Christian galley-slaves were released. At Constantinople apprehensions were even entertained of an immediate attack on the part of the victors. The battle of Lepanto (October 7, 1571) was, as Ranke observes, like that of Actium, a decisive historic struggle between West and East; and the ecstatic joy which it inspired was shared by all Christian Europe. But though, on receiving the great news of a success which seemed in its momentousness to surpass any of his father's achievements, Philip II. had vowed to carry on this Christian war, jealousy between the allies wasted the immediate fruits of the victory, and the by no means remotely possible consequences of an active Franco-Turkish alliance inclined the king of Spain to keep his brother inactive in Sicily. Soon the ever vigilant suspicions of Philip were aroused by information which he received—partly from the candid Don John himself—as to the visions which (instigated by the inveterate papal habit of giving away kingdoms before they had been conquered) suggested themselves to the restless imagination of the hero of Lepanto. At one time Albania and the Morea entreated him to reign over them, after he should have previously freed them from the Turkish yoke; next, Rhodes besought the aid of his invincible arm for the work of its liberation. Meanwhile, after the Turks had brought together another fleet, he was unable to force them to accept another battle at Navarino (September, 1572); and soon afterwards Venice, by concluding a separate treaty of peace with the sultan, put an end to the league which had been victorious at Lepanto. Spain was by herself no match for the Turkish power; and though in 1573 Don John captured Tunis, it was speedily recaptured in the following year.

Although unable to obtain from his brother even so much as the title of an infante of Spain, the ardent spirit of Don John had continued to indulge in wild dreams of a kingdom to be erected by him for himself in those regions which he had successfully disputed with the infidel; and, after suppressing a momentary hankering after the crown of France, which the death of Charles IX. had excited, he had solicited the good offices of pope Gregory XIII. towards his establishment as king of Tunis. The pope, however, had destined him for higher things. As yet King Philip had shrunk from taking up the cause of Rome's unfortunate daughter, held captive in heretic England. Might not a share in the throne of three northern kingdoms tempt Don John to become the hero of a second and more rewardful crusade?

In the midst of schemes and dreams such as these Don John was summoned by King Philip to an office which might seem to bring him near to the accomplishment of the most glorious of them all. He was appointed (in 1576) to the government of the Netherlands, vacant by the death of Requesens. The administration of the latter had not been intended to introduce any radical change into the system of his predecessor Alva; his military operations had been only partially successful; and the pacification of Ghent (October, 1576), concluded since his death, had greatly improved the prospects of William of Orange and the insurrection. The magic of Don John's name, and the loyal energy of which he had given proof, were to recover what had been lost; and he was willing to undertake a task the accomplishment of which might lead to higher tasks beyond. He was, however, now brought into conflict with an adversary of a very different calibre from his own. He showed himself willing to consent to the demand of the dismissal of the Spanish troops from the Netherlands, hoping to be able to employ them in a descent upon England. William of Orange, by warning Queen Elizabeth of these designs, secured not only her good-will, but the rarer proof of it in the shape of a sum of money, and at home drew still tighter the alliance established by the Ghent pacification. Hereupon Don John found himself obliged to grant the perpetual edict (February, 1577), which, in accordance with the pacification, dismissed the Spanish troops designed by him for the conquest of England, and held his entry into Brussels (May 1st) amidst popular acclamations. In secret, however, he was counselling and preparing a renewal of the war; and before the end of the summer he took Namur by a stratagem. The answer was the proclamation of Orange as protector of Brabant, and the nomination as governor-general of the archduke Matthias, under whom Orange continued to hold the actual supremacy, while Don John's control was almost entirely confined to the southwestern part of the Netherlands. He now (January, 1578), declared war against the insurgent provinces, and the dismissed Spanish troops were soon with other forces reassembling under his standard. A large army brought from Lombardy by Alexander Farnese, prince of Parma (Don John's nephew), raised the Spanish forces to a virtual equality in numbers with those of their opponents; and Farnese's victory of Gemblours (January 31, 1578), hopefully opened the campaign. It remained an open question whether the aid of France (which appeared to be warranted by the arrival with an army of the duke of Anjou the "protector" of the liberties of the Netherlands), together with the money of England and the men of the Palatinate, would suffice to make the cause of freedom prevail against the determination of Philip, the ambitious devotion of Don John, and the military genius of Alexander Farnese. On the other hand, it seemed doubtful whether the disunion among Philip's adversaries would weaken them more than his parsimony and suspicion vexed the soul and crippled the energies of his brother. Such was the situation when Don John was removed by death. After having shortly before escaped the dagger of an English assassin (a Catholic refugee, who had hoped by the act to secure the pardon of the queen), Don John succumbed to a sudden illness at Namur on October 1, 1578. An altogether unwarranted, but under the circumstances far from inexplicable, suspicion accused King Philip of having by poison brought about the death of a half-brother whose action his jealousy and distrust of all the world except himself had thwarted after Gemblours as after Lepanto. The settlement of the Netherlands, after whatever fashion Don John might have accomplished it, was a harder task than any he ever executed; and the subjection of heretic England to the authority of a Catholic queen seems to posterity a dream more marvellous than were even the actual glories of Lepanto. But his life, which spanned but little more than thirty-three years, was the reverse of an empty or an ignoble one, and though it was full of imperfections and disappointments, yet its enthusiasm shines forth even under the cold shade spread over it by the fraternal jealousy of a Philip II.

The only modern monograph on the life of Don John of

Austria is that by Professor W. Havemann (Gotha, 1865), which corrects some of Motley's vivacities. For the rebellion of the Moriscoes and the battle of Lepanto see Prescott's *Reign of Philip II.* and Forneron's *Histoire de Philippe II.* (vols. i. and ii., Paris, 1880); for the battle, see also Ranke's *Die Osmanen u. die Spanische Monarchie* (4th ed., 1877). JOHN of Damascus, See Damascenus, vol. vi. p. 696.

JOHN of Gaunt. See Lancaster, Duke of.

JOHN, St., of Nepomuk, or Pomuk (*c.* 1330–1393), the patron saint of Bohemia, was born at Pomuk about 1330. After studying at the university of Prague he took holy orders and was for some time a priest in the diocese of Prague. In 1372 he is mentioned as imperial notary; in 1380 he became rector of the church of St. Gall in Prague, and notary and secretary of the archbishop; and in 1381 he was made doctor of canon law and canon of the metropolitan chapter. He appears to have taken an important part as adviser or supporter of the archbishop John of Janstein in his disputes with King Wenceslaus, and on this account, after suffering cruel torture, he was drowned in the Moldau. The chief events of his life were afterwards adorned with a variety of legends, and in 1729 he was canonized by Benedict XIII. An annual procession in his honor takes place at Prague on May 16. See Abel, *Die Legende vom St. Johann von Nepomuk*, Berlin, 1855.

JOHN of Salisbury (*c.* 1115–1180), a distinguished writer of the 12th century, was born at Salisbury in Wiltshire between the years 1110 and 1120. From the cognomen *Parvus*, which he applies to himself, and from the fact that he was of Saxon, not of Norman race, it may be inferred that his name was Short, or Small, or Little. Few details are known regarding his early life or rank in society; but from his own statements it is gathered that he crossed to France about the year 1131, and began regular studies in Paris under Abelard, who had there for a brief period reopened his famous school on Mont St. Geneviève. After Abelard's retirement, John carried on his studies under Alberich, Robert of Melun, and Robert Pulleyn. Three years he spent at the great school of Chartres, mainly under William of Conches, though it would seem that he had been a pupil of the founder of the school Bernard Silvester. Bernard's teaching was distinguished partly by its pronounced Platonic tendency, partly by the stress laid upon literary study of the greater Latin writers; and the influence of the latter feature is noticeable in all John of Salisbury's works. Returning to Paris, he spent some years there, partly as teacher, partly as pupil of Adam de Ponto Parvo and Gilbert de la Porrée. Whether he attended any of the teachers of the Victorin school is uncertain, but his mode of thinking in theological subjects bears unmistakable traces of the peculiar views of these writers. Probably in the year 1147 or 1148 he crossed to England, with a letter of recommendation from Peter of Celli to Theobald, archbishop of Canterbury. For thirteen years he acted as secretary to Theobald, and was frequently ambassador from the English primate to the papal see. During this time he composed his greatest works, published almost certainly in 1159, the *Policraticus, sive de Nugis Curialium et de Vestigiis Philosophorum* and the *Metalogicus*, writings invaluable as storehouses of information regarding the matter and form of scholastic education, and remarkable for their cultured literary style and humanist tendency. After the death of Theobald in 1162, John continued to occupy the post of secretary to his successor, the famous chancellor Thomas Becket, and took an active part in the long disputes between the primate and his sovereign, Henry II. His letters are of great value for the light they throw upon the obscure course of the constitutional struggle then agitating the English world. With Becket he withdrew to France during the king's displeasure; he returned with him in 1169, and was present at his assassination in 1170. In the following years, during which he continued in an influential situation in Canterbury, but at what precise date is unknown, he drew up the *Life of St. Thomas à Becket*, and somewhat later the *Life of St. Anselm.* In 1176 he was made bishop of Chartres, where he passed the remainder of his life. The date of his death has been variously given as 1182, 1181, or 1180; the strongest reasons are in favor of the last.

John's writings are not in any strict sense philosophical, but they give much information regarding the general currents of thinking at the time, and enable us to understand with much completeness the literary and scientific position of the 12th century. So far as his own views are concerned, they are such as one might expect from a cultured intelligence well versed in practical affairs. His doctrine, on the whole, is a kind of utilitarianism, with a strong leaning, on the side of speculative questions, to the modified, literary scepticism of Cicero. For Cicero, indeed, he has unbounded admiration, and his Latin style, unusually excellent when compared with the average Latinity of the scholastic writers, is evidently moulded on that of Cicero. The remarkable feature of his writings, apart from their value as giving information respecting studies in the 12th century, is their strongly marked humanist tendency. To some extent this is common to John and to his predecessors in the school of Chartres, but no other writer seems to have possessed so extensive and competent an acquaintance with the great works of Latin classical literature. Of Greek writers he appears to have known nothing at first hand, and very little in translations. The *Timæus* of Plato in the Latin version of Chalcidius, was known to him as to his contemporaries and predecessors, and probably he had access to translations of the *Phædo* and *Meno.* Of Aristotle he possessed, in Latin version, the whole of the *Organon;* he is, indeed, the first of the mediæval writers of note to whom the whole was known. Of other Aristotelian writings he appears to have known nothing.

The *Policraticus* seems first to have been printed in 1476, in folio; a quarto reprint reappeared in 1513, and an octavo in the same year, but from different MS. sources; the most common edition is that of 1639. The *Metalogicus* was first printed in 1610; the best known edition is that of 1639. The *Entheticus*, or more correctly *Nutheticus*, was first printed in 1843 by C. Petersen. The collected editions of the works are by J. A. Giles, 5 vols., Oxford, 1848, and by Migne, in the *Patrologiæ Cursus*, vol. 199,—neither accurate. The most complete study of John of Salisbury is the monograph by Schaarschmidt, *Johannes Sarisberienis nach Leben und Studien, Schriften und Philosophie*, which is a model of accurate and complete workmanship.

JOHN, Prester. See Prester John.

JOHNSON, Andrew (1808–1875), seventeenth president of the United States, was born in Raleigh, North Carolina, December 29, 1808. His youth was passed in such poverty that it was not till during his apprenticeship as tailor that he learned to read. His wife taught him to write and cipher after their marriage. Settling in Greenville, Tennessee, he worked at his trade, and in 1828 began to take an active part in politics, organizing a workingman's party, by which he was elected to several local offices. He served in the State Legislature; from 1843 till 1853 he was member of Congress: in 1853, and again in 1855, he was elected governor of Tennessee; and in 1857 he took his seat as United States senator from Tennessee. His independence procured him prominence in the senate. In opposition to the general policy of the Democratic party, whose nominee he was, he ardently supported the homestead bill; and, though in the important presidential election of 1860 he had supported Breckenridge and Lane, the candidates of the southern wing of the Democratic party, yet, when Lincoln was elected, Johnson made a strong speech in the senate, denouncing secession, and pledging himself to unconditional support of the Union. This loyalty to the Union subjected him to grave personal danger from the secessionists of Tennessee, when he returned to the state to organize a Union party. In 1862 Lincoln appointed Johnson military governor of Tennessee, a post of difficulty and danger, in which he displayed an amount of energy and ability in dealing with the secessionists that attracted attention in the north, and led to his nomination for the vice-presidency by the Republican convention of 1864, which nominated Lincoln for the presidency. When, a few weeks after his inauguration, the assassination of Lincoln, on April 14, 1865, made Johnson president, his vigorous denunciation of treason as "a crime that must be punished" placed him for a time high in public favor. The rest of his term of office was spent in dissension with Congress as to the conditions upon which the seceding States should be allowed to return to the Union. Johnson vetoed bill after bill; but Congress passed them over his veto. In August, 1866, the president, attended by members of his cabinet, made a tour through several of the northern and western States, denouncing the action of Congress as rebellious, and appealing to the people to support him. But at the congressional elections of that year the policy of Congress was endorsed by large majorities. The conflict became still more bitter, and was at last brought to a crisis by the president's attempts to remove secretary Stanton from office, after the senate had refused its approval. The Republicans in Congress claimed that Johnson had violated the tenure of office law, and on February 24, 1868, the House of Representatives passed a resolution impeaching him for high crimes and misdemeanors. At the trial before the senate the articles of impeachment were not sustained. A two-thirds majority was necessary for conviction; and thirty-five voted "guilty," nineteen "not guilty." On March 4, 1869, Johnson was succeeded in the presidency by U. S. Grant. Retiring to Greenville, he immediately prepared to re-enter public life; and in January, 1875, he was elected United States senator. He died July 31, 1875.

JOHNSON, Samuel (1709–1784), one of the most eminent English writers of the 18th century, was the son of Michael Johnson, who was, at the beginning of that century, a magistrate of Lichfield, and a bookseller of great note in the midland counties. Michael's abilities and attainments seem to have been considerable. He was so well acquainted with the contents of the volumes which he exposed to sale that the country rectors of Staffordshire and Worcestershire thought him an oracle on points of learning. Between him and the clergy, indeed, there was a strong religious and political sympathy. He was a zealous churchman, and, though he had qualified himself for municipal office by taking the oaths to the sovereigns in possession, was to the last a Jacobite in heart. At his house, a house which is still pointed out to every traveller who visits Lichfield, Samuel was born on the 18th of September, 1709. In the child the physical, intellectual, and moral peculiarities which afterwards distinguished the man were plainly discernible: great muscular strength accompanied by much awkwardness and many infirmities; great quickness of parts, with a morbid propensity to sloth and procrastination; a kind and generous heart, with a gloomy and irritable temper. He had inherited from his ancestors a scrofulous taint, which it was beyond the power of medicine to remove. His parents were weak enough to believe that the royal touch was a specific for this malady. In his third year he was taken up to London, inspected by the court surgeon, prayed over by the court chaplains, and stroked and presented with a piece of gold by Queen Anne. One of his earliest recollections was that of a stately lady in a diamond stomacher and a long black hood. Her hand was applied in vain. The boy's features, which were originally noble and not irregular, were distorted by his malady. His cheeks were deeply scarred. He lost for a time the sight of one eye; and he saw but very imperfectly with the other. But the force of his mind overcame every impediment. Indolent as he was, he acquired knowledge with such ease and rapidity that at every school to which he was sent he was soon the best scholar. From sixteen to eighteen he resided at home, and was left to his own devices. He learned much at this time, though his studies were without guidance and without plan. He ransacked his father's shelves, dipped into a multitude of books, read what was interesting, and passed over what was dull. An ordinary lad would have acquired little or no useful knowledge in such a way; but much that was dull to ordinary lads was interesting to Samuel. He read little Greek; for his proficiency in that language was not such that he could take much pleasure in the masters of Attic poetry and eloquence. But he had left school a good Latinist, and he soon acquired, in the large and miscellaneous library of which he now had the command, an extensive knowledge of Latin literature. That Augustan delicacy of taste which is the boast of the great public schools of England he never possessed. But he was early familiar with some classical writers who were quite unknown to the best scholars in the sixth form at Eton. He was peculiarly attracted by the works of the great restorers of learning. Once, while searching for some apples, he found a huge folio volume of Petrarch's works. The name excited his curiosity, and he eagerly devoured hundreds of pages. Indeed, the diction and versification of his own Latin compositions show that he had paid at least as much attention to modern copies from the antique as to the original models.

While he was thus irregularly educating himself, his family was sinking into hopeless poverty. Old Michael Johnson was much better qualified to pore upon books, and to talk about them, than to trade in them. His business declined; his debts increased; it was with difficulty that the daily expenses of his household were defrayed. It was out of his power to support his son at either university; but a wealthy neighbor offered assistance; and, in reliance on promises which proved to be of very little value, Samuel was entered at Pembroke College, Oxford. When the young scholar presented himself to the rulers of that society, they were amazed not more by his ungainly figure and eccentric manners than by the quantity of extensive and curious information which he had picked up during many months of desultory but not unprofitable study. On the first day of his residence he surprised his teachers by quoting Macrobius; and one of the most learned among them declared that he had never known a freshman of equal attainments.

At Oxford Johnson resided during about three years. He was poor, even to raggedness; and his appearance excited a mirth and a pity which were equally intolerable to his haughty spirit. He was driven from the quadrangle of Christ Church by the sneering looks which the members of that aristocratical society cast at the holes in his shoes. Some charitable person placed a new pair at his door; but he spurned them away in a fury. Distress made him, not servile, but reckless and ungovernable. No opulent gentleman commoner, panting for one-and-twenty, could have treated the academical authorities with more gross disrespect. The needy scholar was generally to be seen under the gate of Pembroke, a gate now adorned with his effigy, haranguing a circle of lads, over whom, in spite of his tattered gown and dirty linen, his wit and audacity gave him an undisputed ascendency. In every mutiny against the discipline of the college he was the ringleader. Much was pardoned, however, to a youth so highly distinguished by abilities and acquirements. He had early made himself known by turning Pope's Messiah into Latin verse. The style and rhythm, indeed, were not exactly Virgilian; but the translation found many admirers, and was read with pleasure by Pope himself.

The time drew near at which Johnson would, in the ordinary course of things, have become a bachelor of arts; but he was at the end of his resources. Those promises of support on which he had relied had not been kept. His family could do nothing for him. His debts to Oxford tradesmen were small indeed, yet larger than he could pay. In the autumn of 1731 he was under the necessity of quitting the university without a degree. In the following winter his father died. The old man left but a pittance; and of that pittance almost the whole was appropriated to the support of his widow. The property to which Samuel succeeded amounted to no more than twenty pounds.
